SELECTED WATER RESOURCES ABSTRACTS

VOLUME 8, NUMBER 7
APRIL 1, 1975

THE LIBRARY OF THE
APR 24 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W75-03301 -- W75-03850

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 8, NUMBER 7
APRIL 1, 1975

W75-03301 – W75-03850

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2A. General

HYDROLOGIC SIMULATION OF A COMPLEX WATERSHED,
Washington State Univ., Pullman. Coll. of Engineering.
H. D. Copp, D. T. Higgins, and G. T. Thompson.
Presented at Ninth American Water Resources Conference, October 1973, Seattle, Washington, Honolulu, Hawaii. 23 p, 11 fig. OWRT B-036-WASH(2), B-043-WASH(1), and B-050-WASH(1).

Descriptors: *Washington, *Watersheds(Basins), Systems analysis, Decision making, *Simulation analysis, Hydrology, Planning, River basin development, *Model studies.
Identifiers: *Yakima basin(Wash).

In the summer of 1970, a program to develop simulation models and to perform certain systems analyses on the Yakima basin was funded. The fundamental intent of three year's research was to develop river basin planning methodology for water and related land resources. Once the techniques were available, they could be used to examine various aspects of resource management. We were not interested in making decisions on how to best manage these resources in the Yakima basin. That is best left to the government agencies, to local basin planners and to the public who are directly affected by resource management. The methodology would be used by the decision-makers to arrive at rational plans. A hydrologic model was developed which will aid planners and decision makers in analyzing impacts of future water management in rather complex watersheds.

THE PROBLEM OF DETERMINING THE MAXIMUM STORM RUNOFF YIELD IN SMALL RIVERS (IN PROBLEMA DETERMINARII DEBITELOR MAXIME DIN PLOI PE RIURI MICI),
Institutul de Meteorologie si Hidrologie, Bucharest (Rumania).
L. Mustata.
Hidrotechnica, Vol 19, No 5, p 236-241, 247, May, 1974. 2 fig, 2 tab, 15 ref.

Descriptors: *Mathematical models, *Storm water, *Storm runoff, Rivers, Climates, *Forecasting, Model studies.
Identifiers: *Romania.

The determination of the maximum storm runoff yield in small rivers is based on the utilization of the maximum runoff modality from the reductional equation, worked out for 7 various climatic zones, depending upon the climatic conditions of Romania. Seven series of module values were transposed by using known empirical values. Thus, the maximum yield in percent and cu m/sec equals the elementary maximum runoff, or the maximum intensity of water replacement in cu m/sec sq km multiplied by the receiving surface in sq km, divided by the receiving surface plus 1 to the n power. The maximum elementary runoff must be determined, considering the other parameters as known. The n parameter varies from 0.46 in the southwestern zone of the Southern Carpathians to 0.55 in the southern part of the Transylvania Plateau. The empirical accuracy of the series was calculated according to the equation: P security value in percent equals m, the number of the values in the series, divided by n, the number of the yrs of the series plus 1, all multiplied by 100 percent. In order to prolong the series of maximum yields for as long a period of time as possible, 7 climatically similar zones were delineated. The method presented permits the determination of maximum storm runoff yields in small rivers without using the statistical parameters Cv and Cs. (Takacs-FIRL)

BINARY TREE MODEL SIMULATION OF THE BEHAVIOR OF URBAN HYDROLOGIC SYSTEMS,
Nebraska Univ., Lincoln. Dept. of Computer Science.
A. J. Surkan, and P. Kelton.
International Journal of Systems Science, Vol 5, No 7, p 639-653, July, 1974. 9 fig, 3 ref.

Descriptors: *Urban hydrology, *Hydrograph analysis, Model studies, Data analysis, Flow, Experiments, *Networks, *Maryland.
Identifiers: *Baltimore(Md).

A simulator of urban hydrologic networks was designed based primarily on geometric descriptors. Its application is demonstrated using data from the Northwood Gaging Installation in Baltimore, Maryland. The simulator incorporates a binary tree model of the network, a polygon representation of the storm geometry, and time-varying rainfall intensity to produce simulated hydrographs of flow. Simulated hydrographs and experimental runoff graphs are compared. (Prague-FIRL)

'PROJECT AQUA' IN POLAND, (IN POLISH),
Polskie Towarzystwo Przyrodnikow im. Kopernika, Warsaw.
B. Szczesny.
Kosmos (Warsaw), Vol 22, No 2, p 147-152, 1973.
Identifiers: Legal aspects, *Limnology classification, *Poland, Projects, Classifications, *Project Aqua, International Biological Program.

'Project Aqua' was created in 1959 during the 14th Session of the International Society of Limnologists for the purpose of selecting fresh water bodies of special interest or value in the world, which would be under special care and legal protection. The following water bodies in Poland were earmarked for inclusion in the project: Lakes Wdzydze, Leba, Sniardwy, Luknajno, Mikolajiki, Mamry, Tajty, Jeziorak, Czarne, Wigry, Hancza, Tatra Mountains Lakes, Goczakowo and 2 rivers, Dunajec and Drweca. Characteristic data for each of the mentioned bodies are given. The above list is not closed and will be corrected and supplemented as progress is made in Poland in hydrobiological studies on other water bodies. 'Project Aqua' falls under the International Biological Program.--Copyright 1974, Biological Abstracts, Inc.

SOME PREDICTED CLIMATIC EFFECTS OF A SIMULATED SAHARA LAKE,
RAND Corp., Santa Monica, Calif.
R. R. Rapp, and M. Warshaw.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-780 652, $3.75 in paper copy, $2.25 in microfiche. Publication No R-1415-ARPA, March 1974. 40 p, 12 fig, 3 tab, 17 ref, 1 append. DAHC15-73-C-0181.

Descriptors: *Climates, *Evaporation, *Computer models, Simulation analysis, Precipitation(Atmospheric), Winds, Deserts, Lakes, Africa, Moisture, Statistical methods.
Identifiers: *Inadvertent climate changes, *Sahara lakes, Moisture flux.

The results of simulating the addition of a large body of water to the Sahara desert using the Rand version of the Mintz-Arakawa general circulation model were described. The simulated lake is a relatively small perturbation to the earth's boundary condition and was chosen to test the hypothesis that an observable and statistically significant change would be produced in the local circulation. By observing the moisture flux and moisture flux divergence as a function of the lake addition, a region was selected in which to test the hypothesis that the precipitation was altered. A significant change in precipitation was subsequently observed over the chosen area. Similarly, a significant wind direction shift in the lower (800-mb) level of the model was found. Speculation on how these simulated results might be used to predict the actual change in the climate was also given. (Schickedanz-ISWS)

MEASUREMENT OF ATMOSPHERIC PRECIPITABLE WATER USING A SOLAR RADIOMETER,
National Aeronautics and Space Administration, Houston, Tex. Lyndon B. Johnson Space Center.
D. E. Pitts, W. McAllum, and A. E. Dillinger.
Available from the National Technical Information Service, Springfield, Va. 22161, as N74-19983, $3.75 in paper copy, $2.25 in microfiche. Technical Memorandum X-58129, February 1974. 27 p, 7 fig, 1 tab, 23 ref.

Descriptors: *Precipitable water, *Solar radiation, *Statistical methods, Remote sensing, Water vapor, Absorption, Least squares method, Atmosphere, Radiosondes, Measurement.
Identifiers: *Solar radiometer, Atmospheric profiles, Transmission(Atmospheric), Spectral bands.

A technique was described and tested that allows the determination of atmospheric precipitable water from two measurements of solar intensity: one in a water-vapor absorption band and another in a nearby spectral region unaffected by water vapor. Measurements of total atmospheric water

vapor were accomplished by determining the ratio of a water-vapor absorbing region (0.9435 micrometer) to a clear channel (0.8730 micrometer). Aerosol extinction is usually a slowly varying function of wavelength in the visible and near infrared. This ratio effectively eliminates the aerosol and Rayleigh scattering leaving only the water-vapor absorption effects. Because a small amount of water vapor may saturate the strong water bands and a large amount of water vapor may not saturate the weak bands, this ratio is neither a linear nor an exponential function of precipitable water. (Jones-ISWS)

A SIMPLE DEVICE FOR ANALYZING THE ENERGY LOAD AND INTENSITY OF RAINSTORMS,
Institute for Agricultural Research, Zaria (Negeria).
J. M. Kowal, W. Kijewski, and A. H. Kassam.
Agric Meteorol 12(2): 271-280, Illus. 1973.

Descriptors: *Rainfall intensity, Rainfall, Rain, Precipitation(Atmospheric), Equipment, *Soil erosion, Surface runoff, *Electrical equipment, Storm runoff, Storms.
Identifiers: Nigeria.

A simple apparatus is described for evaluating the energy load and intensity of rainstorms relevant to studies of soil erosion and surface runn-off. The instrument records graphically, on a time scale, the amplitude of electric pulses originating from the impact of raindrops on the surface of a transducer disc, by making use of the piezo-electric effect. The size distribution of raindrops is calculated by analysing the graphic records of pulses on the chart from the number and the amplitude of pulses, and from the measured volume of total rainfall. The apparatus can be assembled using commercially available materials and recorders. It combines easy handling with acceptable accuracy.--Copyright 1974, Biological Abstracts, Inc.

2C. Snow, Ice, and Frost

USING AERIAL MEASUREMENTS OF FOREST OVERSTORY AND TOPOGRAPHY TO ESTIMATE PEAK SNOWPACK,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
F. R. Larson, P. F. Ffolliott, and K. E. Moessner.
Forest Service Research Note RM-267, July 1974. 4 p, 2 fig, 1 tab, 8 ref.

Descriptors: *Snowpacks, *Water equivalent, *Snow surveys, *Aerial photography, Forests, Canopy, Topography, Slopes, Data collections, Remote sensing, Pine trees, Watersheds(Divides).

It is possible to relate peak snowpack water equivalent measured on the ground to forest overstory and topography attributes measured on aerial photographs. On sites where slope steepness and aspect vary widely and several forest overstory size and density classes are intermixed, only topographic attributes need be measured, and any of the tested photo scales (1:3,000; 1:6,000; 1:15,840) may be used. On nearly level sites where size and density classes are homogeneous, forest overstory attributes also must be measured, and the 1:15,840 scale is best. (Witt-IPC)
W75-03570

ADVANCE OF THE GREENLAND ICE SHEET ON TO NORTH-EASTERN ELLESMERE ISLAND,
Alberta Univ., Edmonton. Dept. of Geography.
J. England.
Nature, Vol 252, No 5482, p 373-375, November 29, 1974. 1 fig, 18 ref.

Descriptors: *Glaciation, *Glaciology, Glaciers, Arctic, Ice, Movement, Geology, Geomorphology, Canada.
Identifiers: Greenland ice sheet, Ellesmere Island.

Geological evidence suggests that an important restricted ice advance occurred along northwestern Greenland and northeastern Ellesmere Island during the last glaciation. Detailed records of multiple glaciations and sea level changes are preserved along the coastlines of Smith Sound, Nares Strait, and Kennedy and Robeson channels. At present the advance of the Greenland Ice Sheet on to northeastern Ellesmere Island is considered inconclusive and, if it did occur, it would have to pre-date the late Wisconsin, and possibly the entire Wisconsin, glaciation. Evidence from glacial geology is also critical for the reconstruction of the time profiles through existing and future ice cores in the region as such data will directly affect the parameters in the flow models chosen. If the ice sheets in the High Canadian and Greenland Arctic were relatively inactive during the last glaciation or glaciations then the ice cores obtained from these areas may be older than originally expected. The chronology of glacial activity during the late Quaternary is, therefore, an important source for both the dating and palaeoclimatic interpretation of the ice cores. (Humphreys-ISWS)

EFFECTS OF OIL UNDER SEA ICE,
Massachusetts Inst. of Tech., Cambridge. Fluid Mechanics Lab.
L. S. Wolfe, and D. P. Hoult.
Journal of Glaciology, Vol 13, No 69, p 473-488, 1974. 8 fig, 12 ref. DOT-CG-12438-A.

Descriptors: *Laboratory tests, *Sea ice, *Oil spills, Laboratory equipment, Water pollution sources, Ice, Evaluation, Arctic, Analytical techniques, Oil pollution, Testing procedures.
Identifiers: Ice-oil interfaces.

Laboratory research was performed to determine the effects of crude and diesel oils on the porous sub-structure of Arctic sea ice. A qualitative description was given of what occurs when oil is placed under the ice and an evaluation of some quantitative measurements was made to determine the maximum extent to which crude oil can spread in an Arctic environment. The extent of the entrapment of oil in the ice-brine matrix was negligible. Even when the porosity of the ice increases markedly during pre-melt conditions, the volume of oil entrapped remains small. The ice does not in any way grow through the oil. The oil is neatly pocketed by the ice as more ice proceeds to form under it. The presence of an oil pool under the ice causes a marked change in the temperature distribution in the ice because the oil pool acts as an insulating layer between the cold air and the relatively warmer sea water. If the crude oil spilled is from a supertanker of 100,000 metric tons capacity, the total volume of oil will be 113,000 cu m and the total area over which it will spread was calculated to be a maximum of 45 sq km (17 square miles), a minimum of 9 sq km (4 square miles) and a 'best' estimate of 17 sq km (6 square miles). Even the largest of these values is considerably smaller than the area over which such a spill would spread in temperate waters. All of these conclusions apply to conditions typical for first-year sea ice. (Humphreys-ISWS)
W75-03646

OBSERVATIONS ON THE INTERNAL STRUCTURE AND ORIGIN OF SOME FLUTES IN GLACIO-FLUVIAL SEDIMENTS, BLOMSTRANDBREEN, NORTH-WEST SPITSBERGEN,
Univ. of East Anglia, Norwich (England). School of Environmental Sciences.
M. A. Paul, and H. Evans.
Journal of Glaciology, Vol 13, No 69, p 393-400, 1974. 7 fig, 5 ref.

Descriptors: *Glaciation, *Geomorphology, *Glacial sediments, On-site investigations, Glaciology, Ice, Tunnels, Glacial soils, Fluvial sediments.
Identifiers: Blomstrandbreen(Spitsbergen), *Flutes.

Some flutes which occur on the surface of a series of glacio-fluvial sediments at the margin of Blomstrandbreen, north-west Spitsbergen, were described. A section in one has revealed a complex internal structure, in which originally horizontal beds have been folded into an anticline whose axis is normal to the ice margin, and whose structure is related to the morphology of the flute. Comparison of the observed deformation with the theoretical distribution of stresses around the base of a subglacial tunnel showed that this deformation could have resulted from flow under such a stress system. These observations support the hypothesis that flutes are formed when unfrozen, water-soaked materials deform subglacially due to the pressure differences that exist in the vicinity of an ice tunnel formed in the lee of some rigid obstruction to ice flow. (Humphreys-ISWS)
W75-03647

NUCLEATION AND GROWTH OF BUBBLES AT AN ICE-WATER INTERFACE,
Nevada Univ., Reno. Lab. of Atmospheric Physics.
S. A. Bari, and J. Hallett.
Journal of Glaciology, Vol 13, No 69, p 489-520, 1974. 25 fig, 4 tab, 23 ref, 1 append. NSF Grant GA-27943.

Descriptors: *Ice-water interfaces, *Laboratory tests, *Bubbles, *Nucleation, Ice, Freezing, Gases, Air, Helium, Growth rates, *Crystal growth, Evaluation, Laboratory equipment.

Nucleation and growth of bubbles during freezing of solutions of air and helium in water were investigated experimentally by using different techniques to give freezing rates between 1 micrometer/sec and 10 mm/sec. Bubbles grow as cylinders below 5 micrometer/sec and become egg shaped, with the narrow ends towards the freezing interface, at higher ice growth velocities. Bubble concentration increases and size decreases with increase of growth rate. The detail of bubble size and concentration is influenced appreciably by the particulate content of the water sample. Very high freezing rates give initially clear ice. Subsequently, bubbles nucleate and grow at grain boundaries within the ice. Bubbles do not move with recrystallization and their spatial distribution shows the grain boundary positions at the time of nucleation. Observations were interpreted in terms of nucleation on particles in suspension in the water and a significant incorporation of air molecules into the ice lattice. Bubble nucleation and growth at a growing ice-water interface is characterized by the initial air concentration, by

the water particulate content, and by the growth rate. Deduction of growth conditions from air bubble characteristics may be achieved subject to the uncertainty caused by the variable particulate content. (Humphreys-ISWS)
W75-03648

DIFFERENTIAL SEA-ICE DRIFT. I. SPATIAL AND TEMPORAL VARIATIONS IN SEA-ICE DEFORMATION,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, III, W. F. Weeks, A. Kovacs, and S. F. Ackley.
Journal of Glaciology, Vol 13, No 69, p 437-455, 1974. 10 fig, 4 tab, 17 ref. NSF Grants AG-344 and AG-492.

Descriptors: *Sea ice, *On-site investigations, *Deformation, Movement, Ice, Velocity, Dynamics, Evaluation, Investigations, Analytical techniques, Mathematical studies, Mathematical models, Least squares method.
Identifiers: *Drift(Sea ice), *Beaufort Sea.

Measurements of mesoscale sea-ice deformation over a region approximately 20 km in diameter were carried out over a five-week period in the spring of 1972 at the Beaufort Sea. They have been analyzed to determine non-linearities in the ice velocity field (due to the discrete small-scale nature of the ice pack), as well as a continuum mode of deformation represented by a least-squares strain-rate tensor and vorticity. The deformation-rate time series between Julian day 88 and 112 exhibited net areal changes as large as 3% and deformation rates up to 0.16% per hour. In the principal axis coordinate system, the strain-rate typically exhibited a much larger compression (or extension) along one axis than along the other. Persistent cycles at approximately 12 h wavelengths were observed in the divergence rate. A comparison of the average residual error with the average strain-rate magnitude indicated that strains measured on a scale of 10 km or greater can serve as a valid measure of the continuum motion of the sea ice. This conclusion was substantiated by a comparison between the mesoscale and macroscale deformation measured over an approximately 100-km diameter region. Regarding pack-ice rotation, vorticity calculations indicate that at low temporal frequencies (0.02/h), the whole mesoscale array rotates as an entity, and consequently, the low-frequency vorticity can be estimated accurately from the rotation of a single floe. (See also W75-03650) (Humphreys-ISWS)
W75-03649

DIFFERENTIAL SEA-ICE DRIFT. II. COMPARISON OF MESOSCALE STRAIN MEASUREMENTS TO LINEAR DRIFT THEORY PREDICTIONS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
W. D. Hibler, III.
Journal of Glaciology, Vol 13, No 69, p 457-471, 1974. 5 fig, 2 tab, 18 ref, 1 append. NSF Grants AG-344 and AG-492.

Descriptors: *Sea ice, Movement, *Theoretical analysis, *Strain, Equations, Mathematical studies, Arctic, Atmosphere, Evaluation, Analytical techniques, Dynamics, Investigations.
Identifiers: *Drift(Sea ice), Mesoscale.

A comparison of mesoscale strain measurements with the atmospheric pressure field and the wind velocity field indicates that the ice divergence rate and vorticity follow the local pressure and wind divergence with significant correlation. For low atmospheric pressures and converging winds the divergence rate was negative with the vorticity being counter-clockwise. The inverse behavior was observed for high pressures and diverging winds. This behavior was shown to agree with predictions based on the infinite boundary solution of a linearized drift theory in the absence of gradient current effects and using the constitutive law proposed by Glen for pack ice. The best least-squares values of the constitutive law viscosity parameters were approximately 10 to the 12th power kg/s. With typical divergence rates these values yield compressive stresses of the magnitude of 100,000 N/m which are similar to values suggested by the Parmerter and Coon ridge model. The infinite boundary solution of the linear drift equation indicates that in a low-pressure region that is reasonably localized in space, ice would be expected to converge for high compactness (winter) and diverge for low compactness (summer). Calculations were carried out with a general linear viscoelastic constitutive law that includes memory effects and a generalized Hooke's law as well as the Glen law as special cases. A best fit of this calculation with strain measurements indicated a better agreement with viscous behavior than with elastic behavior, and the frequency behavior of the estimated 'viscosities' similar to the Glen law behavior at temporal frequencies less than approximately 0.01/h. (See also W75-03649) (Humphreys-ISWS)
W75-03650

A STUDY OF GLACIER FLOW FOR AN OPEN-PIT MINE: AN EXERCISE IN APPLIED GLACIOLOGY,
Cold Regions Research and Engineering Lab., Hanover, N.H.
S. C. Colbeck.
Journal of Glaciology, Vol 13, No 69, p 401-414, 1974. 12 fig, 8 ref.

Descriptors: *Glaciology, *Mathematical models, *Glaciers, Movement, Investigations, Flow, Ice, Velocity, Strain, Ablation, Equations, Feasibility studies, Project feasibility.
Identifiers: *Greenland(Isua).

As part of the feasibility study for the development of an open-pit mine at the edge of the Greenland ice sheet, a study was made of the ice flow toward the proposed pit. The flow was analyzed by considering the two-dimensional flow along seven cross sections. The most favorable profile was determined for each cross section and its flow calculated. The excavation necessary to expose the ore is 106 million cu m of ice. In order to establish favorable profiles 66 million cu m of ice will have to be removed and an additional 7.9 million cu m of ice will have to be removed each year in order to prevent the glacier from thickening and advancing into the mine. Many other glaciological problems must be considered, and field work continues in order to provide more information about the area. (Humphreys-ISWS)
W75-03663

MULTIVARIATE STATISTICAL ANALYSIS OF GLACIER ANNUAL BALANCES,
Centre National de la Recherche Scientifique, Grenoble (France). Laboratoire de Glaciologie.
L. Lliboutry.
Journal of Glaciology, Vol 13, No 69, p 371-392, 1974. 3 fig, 6 tab, 5 ref, 2 append.

Descriptors: *Glaciers, *Glaciology, *Statistical models, *On-site investigations, Mathematical models, Ablation, Analytical techniques, Stochastic processes, *Statistical methods, Model studies.
Identifiers: Multivariate statistical analysis, Annual balances, Linear models.

A statistical analysis was made of the annual balances collected during 16 consecutive years at 32 sites on the ablation area of the Glacier de Saint-Sorlin (French Alps). Only 38% of the 32 times 16 balances are known; moreover, in 8 cases only the total balance for 2 consecutive years is known, and in one case the balance for 4 consecutive years. A comprehensive study of the errors led to the assumption of a linear model for the annual balance. A test of the linear model derived from Tukey's non-additivity test was positive. Although a much more general, non-linear model gives a better representation of 13 times 6 balances forming a complete table of data, the linear model with a standard error of about 0.20 m is good enough to be used in theoretical studies or in routine work. AUTUMN, WINTER AND SPRING SOIL TEMPERATURES IN OKSTINDAN, NORWAY,
University Coll., Cardiff (Wales). Dept. of Geology.
C. Harris.
Journal of Glaciology, Vol 13, No 69, p 521-533, 1974. 7 fig, 3 tab, 12 ref.

Descriptors: *Soil temperature, *Surveys, *On-site investigations, Temperature, Evaluation, Soil investigations, Instrumentation, Snow cover, Air temperature, Freezing, Thawing, Seasonal, Autumn, Winter, Spring.
Identifiers: *Norway(Okstindan).

Soil temperatures were recorded over periods of several weeks in the years 1969 and 1970 at two sites to a depth of 100 cm. Snow depth was of major importance in the rate of freezing of the soil in winter; where snow cover was less than 5 cm in depth, freezing rates were almost double those where snow depth was over 1 m. Snow cover also insulated the soil surface from above-zero air temperatures during spring, and soil thawing commenced from the surface only following the clearance of snow. Similarly, insulation of the soil surface by snow prevented short-term freezing and thawing cycles penetrating the soil, although even where snow cover was absent such short-term cycles were not observed to penetrate the soil to depths in excess of 5 cm. This surficial freezing and thawing of the soil took place more readily in spring than in the autumn. The annual cycle of soil freezing and thawing was the dominant factor in the thermal regime of these soils, short-term freezing cycles affecting only the immediate surface soil layers. VARIATIONS IN THE SLIDING OF A TEMPERATE GLACIER,
Washington Univ., Seattle. Geophysics Program.
S. M. Hodge.
Journal of Glaciology, Vol 13, No 69, p 349-369, 1974. 15 fig, 42 ref. NSF GU-2655. ONR N00014-67-A-0103-0007.

Descriptors: *Glaciers, *Glaciology, *On-site investigations, *Washington, Ice, Surveys, Movement, Velocity, Evaluation, Surfaces, Slopes, Profiles, Temperate, Seasonal, Measurement.
Identifiers: *Basal sliding, *Nisqually Glacier, Mount Rainier.

Measurements of the positions of stakes along the center-line of the lower Nisqually Glacier were made over a two-year period. Variations in the basal sliding speed were calculated from the measured changes in surface speed, surface slope, and thickness, using the glacier flow model of Nye and allowing for the effect of the valley walls, longitudinal stress gradients, and uncertainties in the flow law of ice. The flow is mainly by basal sliding and has a pronounced seasonal variation of approximately + or - 25%. Internal deformation contributes progressively less to the total motion with distance up-glacier. Neither the phase nor the magnitude of the seasonal velocity fluctuations can be accounted for by seasonal variations in the state of stress within the ice or at the bed, and the variations do not correlate directly with the melt-water discharge from the terminus. A seasonal wave in the ice flow travels down the glacier at a speed too high for propagation by internal deformation or basal sliding. The rate of sliding is primarily determined by the amount of water in temporary

storage in the glacier. The peak in sliding speed occurs, on the average, at the same time as the maximum liquid water storage of the South Cascade Glacier. The data support the idea that glaciers store water in the fall, winter, and spring and release it in the summer. This temporary storage may be greatest near the equilibrium line. The amount of stored water may increase over a period of years and be released catastrophically as a jokulhlaup. Any dependence of sliding on the basal shear stress is probably masked by the effect of variations in the hydrostatic pressure of water with access to the bed. (Humphreys-ISWS)

SUBGLACIAL GEOMORPHOLOGY SURROUNDING THE ICE-FREE VALLEYS OF SOUTHERN VICTORIA LAND, ANTARCTICA,
State Univ., of New York, Buffalo. Dept. of Geological Sciences.
P. E. Calkin.
Journal of Glaciology, Vol 13, No 69, p 415-429, 1974. 7 fig, 47 ref. NSF GV-22761.

Descriptors: *Glaciers, *Geomorphology, *Remote sensing, *On-site investigations, *Antarctic, Glaciology, Evaluation, Ice, Topography, Shape, Surveys, Sounding, Depth.
Identifiers: *Radio-echo, Subglacial topography, Wilson Piedmont Glacier, Mackay outlet glacier, Ferrar outlet glacier, Taylor outlet glacier, Victoria Land(Antarctia).

The results of airborne radio-echo (R/E) depth sounding over Wilson Piedmont Glacier, Mackay, Ferrar and Taylor outlet glaciers, and over the ice sheet bordering the mountains, provide ice thicknesses and subglacial topography accurate to 20 m and to 1 km areally. The R/E records show that floors of the Debenham, Wright, and Victoria Valleys occur beneath the Wilson Piedmont at elevations of -260 m, and up to 260 and 670 m, respectively. The 670 m 'threshold' may have blocked easterly marine and glacial invasions experienced by lower valleys. Profiles along the outlet glaciers display large depressions, some below sea-level. These are associated with erosion by tributaries and with glacial erosion through thick dolerite sills. Elevated ridges thought to be sills submerged beneath the heads of these glaciers also limit nourishment from the adjacent part of the ice sheet. The subglacial west flank of the mountains is formed by a series of high steep-sided plateaux with gentle west-sloping surfaces. Block faulting, west-dipping dolerite and sandstone units, and glacial erosion must explain this topography. (Humphreys-ISWS)

ACTUAL EVAPOTRANSPIRATION IN RELATION TO LEAF AREA,
Royal Veterinary and Agriculture Coll., Copenhagen (Denmark). Hydrotechnical Lab.; and Royal Veterinary and Agriculture Coll., Copenhagen (Denmark). Climate Station.
K. J. Kristensen.
Nordic Hydrology, Vol 5, No 3, p 173-182, 1974. 4 fig, 1 tab, 6 ref.

Descriptors: *Evapotranspiration, *Soil-water-plant relationships, Soils, Vegetation, Grasses, Water balance, Precipitation(Atmospheric), Leaves, Water utilization, Barley, Sugar beets.
Identifiers: *Potential evapotranspiration, *Leaf-area index.

The ratio of leaf area to ground area required for maintaining potential evaporation was studied in a 4-year investigation. The influence of leaf area index on the water use and the actual water balance was discussed. Soil water content under barley, sugar beets, short grass and long grass was followed regularly during the growing seasons of 1969-1973 with the neutron scattering method. Soil water content was determined for 20 cm soil layers through a 0-160 cm soil profile. Periodic actual evaporation was calculated from a simplified water balance equation. The potential evapotranspiration was measured directly, and estimated according to Penman. Ratios of actual to potential evapotranspiration were shown as functions of the leaf area index, measured simultaneously with the soil water measurements. The leaf area index must exceed 3 in order to achieve potential evapotranspiration from a crop. As the maximum actual evapotranspiration exceeds the measured potential one, but not significantly the calculated one, the latter was considered to be the most realistic in the growing season. The actual evapotranspiration from barley and sugar beets is constant from one year to another when these crops are grown in high water capacity soils under Danish conditions. (Roberts-ISWS)

POTENTIAL EVAPOTRANSPIRATION IN CENTRAL IRAQ USING THE PENMAN METHOD WITH MODIFIED WIND FUNCTION,
Baghdad Univ. (Iraq). Coll. of Agriculture.
G. A. Al-Nakshabandi, and J. W. Kijne.
Journal of Hydrology, Vol 23, No 3/4, p 319-328, 1974. 1 fig, 3 tab, 27 ref.

Descriptors: *Evapotranspiration, *Winds, Radiation, Pan evaporation, Equations, *Regression analysis, Wind velocity, Meteorology, Statistical methods.
Identifiers: *Potential evapotranspiration, *Iraq, *Penman equation, Wind function.

Radiation was correlated with hours of bright sunshine for central Iraq. The resulting regression equation, which was in good agreement with other regressions derived for similar climatic regions, was used in Penman's combination equation. Wind velocity and the aerodynamic component of pan evaporation were better correlated than wind velocity and pan evaporation divided by the vapor pressure deficit. The resulting wind functions for the standard U.S. Weather Bureau A-pan and the sunken Colorado pan were incorporated in modified Penman equations for use in central Iraq. Potential evapotranspiration calculated according to the modified equations was compared to potential evapotranspiration calculated from the standard Penman equation and from equations with modified wind functions reported in the literature, as well as with experimental data on water use by crops in Iraq. The equation modified for use in Iraq by means of the wind function for the A-pan resulted in a maximum value of the potential evapotranspiration of about 15 mm/day in July and August, which is a reasonable value for tall crops. The relative importance of the aerodynamic term in the combination equation is stressed for arid conditions where advection may be important and the vapor pressure deficit is great. (Roberts-ISWS)

FITTING A THREE-PARAMETER LOG-NORMAL DISTRIBUTION BY LEAST SQUARES,
Environmental Protection Agency, Athens, Ga. Southeast Water Lab.
W. M. Snyder, and J. R. Wallace.
Nordic Hydrology, Vol 5, No 3, p 129-145, 1974. 11 fig, 13 ref.

Descriptors: *Probability, *Distribution patterns, *Histograms, *Hydrologic data, Analytical techniques, *Least squares method, Parametric hydrology, Statistical methods, Streamflow, Runoff, Mathematics.
Identifiers: *Log-normal distribution, *Functional transform, Tolerance limits.

A three-parameter log-normal distribution was derived as an exact functional transform of an embedded normal distribution. The parameters of this function were evaluated by fitting to histograms of natural hydrologic data. The practice of transformation of data was made unnecessary and could be eliminated. Tolerance limits of extreme hydrologic events can be calculated as transforms of the exact tolerance limits of the embedded normal, permitting precise probabilistic statements on such statistics as T-year floods or droughts. CALCULATION OF TEMPERATURE VARIATIONS OF SMALL MOUNTAIN STREAMS,
Vrije Universiteit, Amsterdam (Netherlands). Dept. of Meteorology.
H. F. Vugts.
Journal of Hydrology, Vol 23, No 3/4, p 267-278, 1974. 5 fig, 2 tab, 13 ref.

Descriptors: *Streams, *Temperature, Energy equation, Radiation, Heat flow, Mountains, *Water temperature, Measurement, Meteorology, *Energy budget.
Identifiers: Net radiation, Bowen ratio.

Temperatures of small mountain streams were accurately predicted by an energy balance method. The technique was tested by performing micrometeorological measurements along the Vigilbach (Rio di San Vigilio/Dolomites, northern Italy). The water temperature was measured at 8 points from the source down to a distance of 9 km. A simple energy budget equation and measurements of five meteorological parameters made it possible to predict water temperature variations of a mountain stream with an accuracy of 10%. It appeared that during the day on unshaded stretches the net radiation and the transfer of heat by conduction and turbulence are the predominant energy sources,

and that during the night the energy gain due to friction of the water with the bottom plays an important role in the energy budget. The minimum water temperature was reached at 6 a.m. and the maximum was observed near 2 p.m., an hour after the maximum air temperature and the maximum net radiation. The fast response of the water temperature to the meteorological elements was the result of the shallowness of the stream. The mean daily water temperature occurred at about 10 a.m., and the daily amplitude of the water temperature increased in a downstream direction. Various energy balance terms were discussed and some results were shown. (Roberts-ISWS)

ON THE VARIABILITY OF SEASONAL PARAMETERS IN HYDROLOGIC TIME SERIES,
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
R. G. Quimpo, and M-S. Cheng.
Journal of Hydrology, Vol 23, No 3/4, p 279-287, 1974. 5 fig, 2 tab, 4 ref. NSF Grant GK-20388.

Descriptors: *Time series analysis, *Seasonal, *Synthetic hydrology, *Statistical methods, Analytical techniques, Stochastic processes, Streamflow, Simulation analysis, Mathematics, Model studies, Least squares method.
Identifiers: *Harmonic analysis, Random component.

The attempt to preserve seasonal characteristics in the modeling of streamflow time series has given rise to a decomposition scheme wherein a random process is superimposed on another periodic process. The identification of the seasonal component is generally done by harmonic analysis. The residuals are fitted with models which preserve autocorrelation at non-zero lags. Strong empirical evidence indicates that the amplitude and phase of the periodic component vary a lot with variation in the random process. The nature of this variability was examined by using simulated time series whose structure was assumed known. The random component tends to distort estimates of the amplitude and phase so that a relatively long series is needed to estimate parameters (60 years of simulated monthly data to give coefficients of variation of 0.16 for the amplitude and 0.20 for the phase angle). The variation of the phase angle and amplitude is highly dependent on the ratio of the variance explained by the periodic component to the variance of the random component. (Singh-ISWS)

OPTIMAL IDENTIFICATION OF PARAMETERS IN AN INHOMOGENEOUS MEDIUM WITH QUADRATIC PROGRAMMING,
California Univ., Los Angeles. Dept. of Engineering Systems.
W. W-G. Yeh.
49th Annual Fall Meeting of Society of Petroleum Engineers of AIME, October 6-9, 1974, Huston, Texas. Paper Number SPE 5021, 1974, (California Water Resources Center Project UCAL-WRC-W-290). 3 tab, 12 ref.

Descriptors: *Computer programs, *Algorithms, *Aquifers, *Optimization, Equations.
Identifiers: *Quadratic programming.

A new algorithm is developed for parameter identification in a partial differential equation associated with an inhomogeneous aquifer system. The parameters chosen for identification are the storage coefficient, a constant and transmissivities, functions of the space variable. An implicit finite-difference scheme is used to approximate the solutions of the governing equation. A least-squares criterion is then established. Using distributed observations on the dependent variable within the system, parameters are directly identified by solving a sequence of quadratic programming problems such that the final solution converges to the original problem. The advantages of this new algorithm include rapid rate of convergence, ability to handle any inequality constraints and easy computer implementation. Numerical example presented demonstrates simultaneous identification of twelve (12) parameters in matter of seconds of computer time. (Snyder-California,Davis)

ON THE OPTIMAL IDENTIFICATION OF PARAMETERS IN A PARABOLIC SYSTEM,
California Univ., Los Angeles. Dept. of Engineering Systems.
W. W-G. Yeh.
48th Annual Fall Meeting of American Institute of Mining, Metallurgical, and Petroleum Engineers, Inc., Sept 30-Oct 3, 1973, Las Vegas, Nevada. Paper Number SPE 4547, (California Water Resources Center Project UCAL-WRC-W-290). 2 fig, 2 tab, 8 ref.

Descriptors: *Systems analysis, *Porous media, *Unsteady flow, *Optimization, Equations, Linear programming.
Identifiers: *Quasilinearization.

An analysis is presented of the problem of parameter identification in unsteady fluid flow through a porous medium. The response of the system is governed by a second order partial differential equation of parabolic type. Identification is an inverse process whereby the parameters imbedded in a differential equation is determined from observations of systems input and output along with appropriate initial and boundary conditions. These parameters are usually not physically measurable. In general, the governing equation is non-linear with no closed-form solution. This inverse problem is solved by quasilinearization, maximum principle, gradient method, influence coefficient method and linear programming. A comparison is made between these methods. The problem of convergence and stability is discussed and demonstrated by numerical experimentation. (Snyder-California,Davis)

MOISTURE PROFILES IN SWELLING SOILS,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Environmental Mechanics.
T. Talsma.
Australian Journal of Soil Research, Vol 12, No 2, p 71-75, December 1974. 2 fig, 1 tab, 9 ref.

Descriptors: *Soil water movement, *Expansive clays, Soil physical properties, Expansive soils, Moisture content, On-site tests, Water table, Equilibrium, *Soil moisture, *Soil profiles.
Identifiers: *Swelling soils.

Recent developments in the theory of hydrostatics and hydrodynamics of swelling soils have predicted that they will differ considerably from non-swelling soils in many aspects of their hydrologic behavior. Examples used to illustrate the results have been derived from arbitrary or laboratory data on soil properties. To test the results in the field, equilibrium moisture profiles in two clay soils and one loam soil with permanent shallow water tables are examined. In addition, moisture profiles in periods of approximately steady upward flow are examined for one of the clay soils. The equilibrium profiles observed in the clays are typical of the predicted 'hydric' profiles for swelling materials; and water moves upwards against the moisture gradient. The equilibrium profile for the loam is typical of those observed for non-swelling materials. (Levick-CSIRO)

DETERMINATION OF LIQUID CONDUCTIVITY OF CAPILLARY POROUS SOLIDS,
Waterloo Univ. (Ontario).
D. Berger, and D. C. Poi.
Australian Chemical Engineering, Vol 15, No 9, p 19-23, September 1974. 3 fig, 2 tab, 3 ref.

Descriptors: *Hydraulic conductivity, *Porous media, *Measurement, Laboratory tests, *Capillary conductivity, Drying, Heat balance, Heat transfer.

An experimental technique is proposed, and results of tests reported, whereby conductivity is determined by a method based on the rate of drying of the solid within an isothermal constant rate period. This factor is direct and easy to measure, by contrast with the liquid content profile, which is required by other methods. The value of conductivity obtained represents the effective value for the entire drying process, and can be utilized to predict the performance of the same solid under non-isothermal conditions. SOIL MOISTURE-VEGETATION-TEMPERATURE RELATIONSHIPS IN CENTRAL ALASKA,
California Univ., Davis. Dept. of Water Science and Engineering.
J. N. Luthin, and G. L. Guymon.
Journal of Hydrology, Vol 23, No 3/4, p 233-246, 1974. 4 fig, 1 tab, 19 ref.

Descriptors: *Soil moisture, *Alaska, *Vegetation, *Soil temperature, Temperature, Frozen soils, Pore pressure, Drainage, Hydrology, Model studies, On-site investigations.
Identifiers: Thermistors, Internal drainage, Thermal regime, *Goldstream Valley(Alas).

Measurements of soil moisture and soil temperature were made during the summer of 1972 at four locations in the Goldstream valley near Fairbanks, Alaska. Two sites were under aspen-birch forest, one in stunted black spruce forest, and one in cleared grassland. These field results and observations of conditions in central Alaska led to the development of a model showing the interrelationship among drainage, vegetative cover, and the thermal regime of the mineral soil. In addition the subsystem comprising the thermal regime system have been identified. There were areas where the microclimate will cause permafrost to occur in the soil regardless of the vegetative cover and/or presence of peat layer. The remainder of the region normally did not have permafrost if vegetative effects were removed. The vegetative canopy, the snow, and the surface organic layer may be lumped together as a single system, a buffer zone between the atmosphere and the mineral soil. Permafrost created a poorly drained environment that inhibited evapotranspiration. (Roberts-ISWS)

Identifiers: *One-dimensional flow, *Wetting front, Flux, Hydraulic head.

Part II compiles solutions obtained by the methods described in part I (See also W75-01990). Techniques for numerical solutions were obtained in part I to the transient, three-dimensional axisymmetric, unsaturated moisture movement through homogeneous soil due to infiltration over a horizontal circular surface area. These relationships were applied to measurements in ring infiltrometers and similar problems of unsaturated axisymmetrical flow. The results illustrated how greater understanding of the infiltration process can result by contracting a series of solutions obtained by varying a single problem solution. (Visocky-ISWS)

EFFECTS OF EXPERIMENTAL SOIL MOISTURE FLUCTUATIONS ON TURNOVER RATES OF TESTACEA,
Calgary Univ. (Alberta). Dept. of Biology.
J. D. Lousier.
Soil Biol Biochem, Vol 6, No 1, p 19-26, 1974.
Identifiers: Aspen, *Soil moisture, *Testacea, Turnover rates, *Canada(Rocky Mountain region).

Experiments designed to obtain data on the quantitative effects of an artificial increase in soil moisture content during a seasonal dry period on numbers of soil Testacea were carried out in well-drained aspen woodland soil in the Rocky Mountains of Canada. The general effect of the addition of water to the soil was to increase significantly the number of active Testacea and decrease the number of encysted forms. Numbers of active Testacea and of living Testacea (active plus encysted forms) showed significant, positive correlation with soil moisture content. A method for the estimation of standing crop turnover and secondary production is discussed. Generation times were shorter and secondary production higher in the watered plots.--Copyright 1974, Biological Abstracts, Inc.

PREDICTION OF SUBTROPICAL STORM SOIL LOSSES FROM FIELD PLOT STUDIES,
Rhodesia Univ., Salisbury. Dept. of Geography.
M. A. Stocking, and H. A. Elwell.
Agric Meteorol, Vol 12, No 2, p 193-201, 1973.
Identifiers: Infiltration, *Prediction, Runoff, *Soil losses, *Vegetation cover, *Corn(Field), *Tropical storms.

Daily soil losses were recorded from experimental field plots planted to maize on 2 different but common soil types. Planting densities were 12,350-37,000 plants/ha and slopes, 3-8%. One bare fallow plot was included in the investigation. The results show the significance of derived energy-intensity parameters in predicting soil losses: EI30 (total kinetic energy x maximum sustained energy over 30 min) on bare soil; EI15 on all covered plots to nearly maximum vegetal cover; and EI5 on high density late season crops. Different slopes appear to have no relevance as to choice of parameter. Cover combined with varied infiltration and runoff conditions are suggested as the main determinants for choice of storm soil loss parameters.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Lakes, *Groundwater movement, *Evaporation, *Water balance, *Tritium, Radioisotopes, Energy budget, Estimating, Advection, *Australia.
Identifiers: Little Blue Lake(SA), Gambi Plain(SA).

In an investigation of the water balance of a small lake which penetrates a limestone aquifer in South Australia, a combination of tritium balance and evaporation estimates was used. Calculation of an approximate tritium balance using semi-empirical methods of estimating evaporation gave an approximate value for groundwater inflow, which was used to estimate the advected term in the lake's energy budget, and hence revise the initial estimate for evaporation. The revised estimate allowed a refinement of the tritium balance which in turn gave a more precise estimate of groundwater inflow. The estimate of groundwater flow is in good agreement with a value computed using groundwater isopotentials and lake and ground-

water chemistry. Groundwater throughflow in the lake, which has a volume of 96,000 cubic meters, is estimated to be about 30,000 cubic meters annually. (Levick-CSIRO)

THE BIOLOGY OF A LANDLOCKED FORM OF THE NORMALLY CATADROMOUS SALMONIFORM FISH GALAXIAS MACULATUS (JONYNS): V. COMPOSITION OF THE DIET,
New South Wales State Fisheries, Sydney (Australia).
D. A. Pollard.
Aust J Mar Freshwater Res Vol 24, No 3, p 281-295, 1973.
Identifiers: Amphipods, *Australia(Lake Modewarre), Biology, Catadromous, Chironomids, Cladocers, Copepods, Crustacean, *Diet(Fish), *Galaxias-maculatus, Growth, Insects, Lakes, Larvae, Ostracod, Salmoniform, Seasons, Trichoptera, Victoria, Zygoptera.

The composition of the diet of a landlocked form of the normally catadromous stream-dwelling fish G. maculatus from Lake Modewarre in southwestern Victoria (Australia) was studied using a new method of stomach contents analysis based on the principle of ranking. The overall diet of this landlocked fish was found to consist mainly of amphipods, chironomid larvae and copepods (basic food types), with other groups of crustaceans (Cladocerans and ostracods) and insects (trichopteran and zygopteran larvae) being of lesser importance (secondary food types) and a few other incidential food types occurring in only small amounts. The diet of this landlocked form thus consists mainly of crustaceans, in contrast to that of the stream-dwelling form which comprises mainly insects. There was a change in the pattern of feeding in the landlocked fish with growth, the smaller fish eating more of the smaller planktonic and the larger fish more of the larger littoral-benthic food organisms. Amphipods were the dominant food type during all seasons except autumn, when copepods were dominant. Cladocerans were also important when they bloomed in summer, and chironomid adults when they swarmed in autumn. Selection coefficients indicated that those food types which were dominant in the diet were actively selected and those that were unimportant were avoided. This landlocked galaziid was found to share most of the available food resources with the other 4 fish species found in the lake and can be broadly classified as a euryphagic carnivore. AN OUTLINE OF THE PHYSICAL LIMNOLOGY OF LAKE MALAWI (LAKE NYASA),
Ministry of Agriculture and Natural Resources, Monkey Bay (Malawi). Fisheries Research Unit.
D. H. Eccles.
Limnology and Oceanography, Vol 19, No 5, p 730-742, September 1974. 9 fig, 1 tab, 14 ref.

Descriptors: *Limnology, *Lakes, *Data collections, Physical properties, Thermocline, Water temperature, Stratification, Geomorphology, Profiles, Currents(Water), Climatic data, Hydrologic data, On-site data collections, Evaluation, Africa.
Identifiers: *Malawi(Lake Malawi).

Lake Malawi, in tropical central Africa, is 560 by 75 km and consists of a single basin, maximum depth 695 m. Below 250 m the lake is homothermal at about 22.5C and is anoxic. Above this level there is a seasonal cycle with the development of a marked thermocline. By May the upper 60 m is homothermal at about 27C. During the dry, windy, cool season the epilimnion cools, but only in exceptional years approaches a homothermal condition. Complete mixing has never been observed. In the shallower southeast arm the surface temperature may fall to 21C as the result of inshore chilling; this cool water flows northward as a profile-bound density current and appears to maintain the stability of the stratification. Large-scale oscillations of the level of the thermocline, apparently the result of internal waves and of wind-induced upwelling, cause advections of water from the metalimnion into the southeast arm, site of the major fishery in the lake. (Humphreys-ISWS)

RANGE OF CUMULATIVE SUMS, II. APPLICATION TO STORAGE CAPACITY OF RESERVOIRS,
Colorado State Univ., Fort Collins.
J. D. Salas-La Cruz.
Journal of Hydrology, Vol 23, No 3/4, p 329-339, 1974. 9 fig, 1 tab, 5 ref. NSF Grant GK-31512X.

Descriptors: *Storage capacity, *Reservoirs, *Seasonal, *Mathematical models, Inflow, Statistical methods, Markov processes, Streamflow, Stochastic processes, Hydrology, Analytical techniques, Computers, Water level fluctuations.
Identifiers: *Range of cumulative sums, Periodic variables.

An attempt was made to determine the storage capacity of a reservoir when within-the-year water fluctuations are taken into account. A sensitivity analysis was carried out to determine the characteristics of the expected range for various types of input series and the long-term effect of the phases of the periodic components. Subsequently, a mathematical model was proposed for the expected storage as composed of a deterministic part and a stochastic part. An example of the application of the proposed model was included. RECENT LIMNOLOGICAL STUDIES OF OKANAGAN BASIN LAKES AND THEIR CONTRIBUTION TO COMPREHENSIVE WATER RESOURCE PLANNING,
Fisheries Research Board of Canada, West Vancouver (British Columbia). Pacific Environment Inst.
J. G. Stockner, and T. G. Northcote.
Journal Fisheries Research Board of Canada, Vol 31, No 5, p 955-976, 1974. 9 fig, 11 tab, 28 ref.

Descriptors: *Limnology, *Lakes, *Water resources, *Comprehensive planning, *Canada, Management, Geomorphology, Thermal properties, Economic impact, Currents(Water), Alternative planning, Ions, Nutrients, Phosphorus, Chemical properties, Mercury, Nitrogen, Phytoplankton, Rooted aquatic plants, Periphyton, Water pollution sources, Zooplankton, Benthos, Paleolimnology, Fisheries, Bioassay, Water quality, Trophic level.
Identifiers: *Okanagan Basin(British Columbia).

The contribution of limnology in comprehensive planning for water resources management served four basic functions in the study of the Okanagan Basin, British Columbia Lakes by providing an assessment of current conditions, predicting lakes' response to future waste loadings, estimating lake assimilative capacity, and in developing a monitoring program to assess lake response to implementation of waste management plans. The manner and sequence in which these functions were allied to the development of overall planning strategies is diagrammatically illustrated. Essentially all limnological studies were necessary to an understanding of current conditions although fewer contributed to the determination of lake nutrient assimilative capacity. Only five studies served to guide future lake monitoring. The effectiveness of a particular study is determined on the number of functions it fulfills. Five studies were major contributors: Paleolimnology, chemical and physical limnology, bioassay, and periphyton. The remaining investigations contributed more to specific programs than to general functions. Paring down expansive programs to 'bare bones' limnology has proved to be a valuable feature of the initial planning procedure and should be encouraged in future studies of this type. The role of limnologists in this type of study is discussed and encouraged. (Auen-Wisconsin)

THE NATURE OF WATER POTENTIAL GRADIENTS IN TREES, (IN GERMAN),
Hochschule fuer Bodenkultur, Vienna (Austria). Botanisches Institut.
H. Richter.
Ber Dtsch Bot Ges, Vol 85, No 7/9, p 341-351, 1972. English summary.
Identifiers: Cohesion, Gradients, *Suction tensions, *Trees, *Water potential gradients, *Distribution patterns.

The distribution of water potentials (or, in a closely corresponding terminology, suction tensions) in trees is frequently discussed without an adequate consideration of both experimental and theoretical aspects of the problem. The relative importance of hydrostatic tensions thus generally becomes vastly overestimated (Plumb and Bridgman 1972). Results from work with the pressure bomb technique suggest frictional gradients as a by far more important factor for the total tension difference between 2 points in the plant. A true gradient of potential or pressure is established only along a coherent conduit in the xylem, however not between the twigs at the end of different branches. It can be shown that, under certain environmental conditions, tension differences between these end twigs may become negligible. This fact cannot serve as an argument against the validity of the cohesion concept as suggested by Tobiessen et al. 1971; rather it is a necessary consequence of the suction tension equation and the well-known minimal differences of potential osmotic pressures in a tree.--Copyright 1974, Biological Abstracts, Inc.

LIGHT AND WATER SUPPLY AS FACTORS INFLUENCING THE DEGREE OF STOMATAL OPENING IN CONIFERS, (IN GERMAN),
Hochschule fuer Bodenkultur, Vienna (Austria). Botanisches Institut.
W. Rottenburg, and T. Koeppner.
Ber Dtsch Bot Ges, Vol 85, No 7/9, p 353-362, 1972. English summary.
Identifiers: Abies-alba, *Confers, Flow, *Light, Porometer, *Stomatal openings, Taxus-baccata, Viscous, *Water supply.

Dependence of stomatal reactions on light and water supply was investigated on Abies alba and Taxus baccata under controlled environmental conditions. A viscous flow porometer specially developed for determination of the opening degree of coniferstomata was used. The maximum stomatal opening of Abies and Taxus is given as a result of an illumination time of approximately 40-50 min. The stomata of Abies show an earlier and more sensitive reaction than Taxus on water deficit caused by transpiration. In principle, the stomata of Abies and Taxus show a similar reaction to darkening, Taxus however closes faster. Each species reaches a maximum of stomatal opening according to the light intensity. These maxima are at very different light intensities. An increase of leaf-temperature must not be held responsible for the decrease of the stomatal opening with increasing light intensity. On the contrary, the increasing water deficit seems to cause the closure of the stomata. The more the water deficit increases the more the stomata are closed. Taxus reacts significantly more sensitively than Abies. If a needle is detached and measurements of the stomatal opening are done in short intervals (30s), no change shows up during the 1st 2 min. Afterwards a short opening reaction can be observed owing to the loss of turgor of the cells adjacent to the guard cells. Then the degree of stomatal opening decreases constantly owing to the loss of water. Again the stomata of Taxus are closed significantly faster than the stomata of Abies.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS OF THINNING ON NEEDLE WATER POTENTIAL IN RED PINE,
Minnesota Univ., Saint Paul. Coll. of Forestry.
E. Sucoff, and S. G. Hong.
For Sci, Vol 20, No 1, p 25-29, 1974, Illus.
Identifiers: *Needle water potential, *Pine trees(Red), *Pinus-resinosa, Soil moisture, *Thinning(Trees).

Soil moisture (SM) and needle water potential (Psi sub n) were measured the season following thinning on comparable trees (Pinus resinosa) in thinned and unthinned plots. SM availability was described by plotting Psi sub n at dawn against SM content. SM was always higher in the thinned plot but Psi sub n was significantly higher in the thinned plot on only 4 of 10 measurement days. On these 4 days, SM was more available to the thinned trees. Significant differences in Psi sub n occurred on 20% of the days during the 1969 growing season.--Copyright 1974, Biological Abstracts, Inc.

HYDRATION OF EASTERN HEMLOCK AS INFLUENCED BY WAXING AND WEATHER,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Ecology and Climatology.
N. C. Turner, and H. C. De Roo.
For Sci, Vol 20, No 1, p 19-24, 1974, Illus.
Identifiers: Air, Extracellular, Film, Freezing, *Hemlock, *Hydration, Stem diameter, Temperature, Transpirant, Tsuga-canadensis, Wax, *Waxing, *Weather, *Xylem pressure potential, Trees.

The xylem pressure potential and stem diameter of small, container-grown, eastern hemlock (Tsuga canadensis (L.) Carr.) trees placed in an open field were measured several times during 6 Jan. and 1 May 1972. Some trees were sprayed with 1 or 2 coats of either 20% (v/v(volume in volume)) or 40% Mobileaf, a wax-film antitransparant. The wax provided no significant thermal insulation for the needles. On days when the air temperature was above 0C, the xylem pressure potential was lower in unwaxed trees than in waxed trees and decreased with increasing vapor pressure deficit of the air in the unwaxed but not in the waxed trees. Those treated with 40% Mobileaf had only slightly higher potentials than those treated with 20% Mobileaf, and trees with a 2nd film of wax maintained only slightly higher potentials than those with a single film. On days when air temperatures were below 0C, the potentials of the waxed and unwaxed foliage were very similar but differed after warming for 1 hr at 19C. Warming the foliage initially increased the potentials in all treatments. At temperatures below 0C the trees had lower potentials at equivalent vapor pressure deficits than those sampled at above 0C. Temperatures below 0C also significantly reduced the diameter of the stems in both waxed and unwaxed hemlocks. Apparently, low potentials and stem shrinkage at temperatures below 0C arise from extra-cellular freezing which antitranspirants affect little, but antitranspirants can reduce dehydration markedly on warm spring days.--Copyright 1974, Biological Abstracts, Inc.

THE SPHAGNUM FLORA OF HOT SPRINGS IN ICELAND,
Copenhagen Univ. (Denmark). Inst. of Systematic Botany.
B. Lange.
Lindbergia, Vol 2, No 1/2, p 81-93, 1973.
Identifiers: Flora, *Iceland(Hot springs), *Sphagnum, Sphagnum-palustre, Sphagnum-papillosum, Sphagnum-subnitens, Sphagnum-teres, Springs, Temperature, Aquatic plants, Hydrogen ion concentration.

The Sphagnum flora of the hot springs in Iceland is mostly associated with alkaline waters and is often much more richly developed there than in other parts of Iceland. Dominant species are S. teres, S. papillosum, S. subnitens and S. palustre. Of these, only S. teres is dominant in the Sphagnum flora of Iceland as a whole, while S. palustre is exclusive to the springs. Several species associated with the springs can be considered members of an oceanic element. The flora of the individual springs varies, probably due to differences in chemical composition of the water but, overall, the spring flora differs radically from that elsewhere in Iceland. The most characteristic species are also those which grow closest to the very hot water. Water temperatures of up to 42C have been measured in Sphagnum tussocks.--Copyright 1974, Biological Abstracts, Inc.

RAINFALL INTERCEPTION IN A FOREST IN THE VELEN HYDROLOGICAL REPRESENTATIVE BASIN,
Swedish Meteorological and Hydrological Inst., Stockholm.
B. Bringfelt, and P-O. Harsmar.
Nordic Hydrology, Vol 5, No 3, p 146-165, 1974. 7 fig, 7 tab, 5 ref.

Descriptors: *Rainfall disposition, *Forests, Canopy, Precipitation gages, *Interception, Rainfall, Throguhfall, Evaporation, Hydrology, Watersheds(Basins), Rain gages, On-site data collections, Storage capacity.
Identifiers: *Sweden.

During the summer and autumn of 1973, 25 rain troughs were operating below canopy and 4 in clearings of a predominantly coniferous forest in the Velen hydrological research area in southern Sweden. The troughs gave values of rainfall and throughfall. Stemflow was found to be below 5%, therefore, the difference was the rain intercepted on the canopy. The collected rain water amounts were measured 14 times, about once a week. These data and the records from a tipping-bucket rain gage were used in a simple model for throughfall. The overall water storage capacity of the forest canopy was about 2 mm and the free throughfall coefficient p was about 0.5. Observation of 50 photographs taken upward from the troughs indicated a smaller p-value. The time for evaporation of the intercepted water after an average rain storm was roughly estimated as 5 hours. About 26% of the total rainfall was intercepted and evaporated. Errors due to differences between types of gages were eliminated by using only values from troughs for both rainfall and throughfall. (Roberts-ISWS)

MICROCLIMATE AND THERMAL STRESS OF MAN IN AN ALEPPO PINE PLANTATION AND AN OAK SCRUB,
Volcani Inst. of Agricultural Research, Ilanot (Israel). Forestry Div.
G. Schiller, and R. Karschon.
Isr J Agric Res 23(2): 79-90, Illus. 1973.

Descriptors: *Recreation, Camp sites, *Forest management, Forests, *Microclimatology, Climates, *Pine trees, *Oak trees, *Environmental effects.
Identifiers: Aleppo pine, *Israel(Judean Hills).

Microclimatic measurements in an Aleppo pine plantation and in an open scrub in the Judean Hills showed a distinct improvement of the microclimate by the pine forest over that outside the plantation: lowering of air temperature, black-body temperature, global radiation, wind velocity and evaporation, and rise of relative humidity. Estimated values of thermal stress of man expressing the combined effects of environmental conditions and metabolic rate, were generally lower both within the Aleppo pine plantation and near its edge, than in the oak scrub. The implications of the findings for recreation and forest management are discussed.--Copyright 1974, Biological Abstracts, Inc.

CHANGES IN STEM DIAMETER OF HERBACEOUS AND WOODY PLANTS AS A MEASURE OF INTERNAL WATER BALANCE,
Pahlavi Univ., Shiraz (India). Coll. of Agriculture.
N. Sionit, and D. W. Henderson.
Iran J Agric Res 2(1): 39-50, 1973.

Descriptors: Climates, *Dendrometers, Electronic equipment, *Herbaceous plants, Irrigation, Light, Ligustrum-vulgare, Nicotiana-tabacum, Soils, Solanum-Tuberosum, *Stem diameter, Transpiration, *Woody plants, *Water balance.

A highly sensitive electronic dendrometer was used for studying the water relations and factors affecting the internal water balance of herbaceous plants. A potato (Solanum tuberosum L.) and a tobacco plant, (Nicotiana tabacum L.) with non-woody stem structure, as well as a privet tree (Ligustrum vulgare L.), with woody-stem structure, showed the following changes in stem diameter: rapid changes in response to light, diurnal variations due to climatic conditions and long term changes due to soil conditions Shrinkage in stem diameter was observed as soon as lights were turned on. This shrinkage was faster in the afternoon, when other climatic conditions were suitable for high transpiration. A rapid increase in stem diameter and transpiration rate was observed in both herbaceous and woody-stem plants immediately after irrigation. As soil water was depleted the rate of increase in stem diameter and transpiration declined. At low soil water content the stem started to shrink. These variations in stem diameter, due to changes in climatic and soil water conditions, were good indicators of the internal water balance for both herbaceous and woody-stem plants.--Copyright 1974, Biological Abstracts, Inc.
W75-03840

EFFECT OF WATER STRESS UPON ENDOGENOUS ETHYLENE LEVELS IN VICIA FABA,
Ain Shams Univ., Cairo (Egypt). Dept. of Horticulture.
A. S. El-Beltagy, and M. A. Hall.
New Phytol, Vol 73, No 1, p 47-60, 1974.
Identifiers: Abscission, Diffusion, *Ethylene(Endogenous), Flower abscission, Growth rates, Leaf abscission, Senescence, Synthesis, *Vicia-faba, *Water stress.

Conditions of drought or waterlogging lead to greatly increased internal ethylene concentrations in Vicia faba L. These increases appear to be due partly to decreased diffusion and partly to increased synthesis and are superimposed on normal diurnal fluctuations in internal ethylene concentration. The higher concentrations observed are correlated with a reduction in growth rate and increased leaf and flower abscission and senescence. The role of ethylene in the mediation of developmental responses to water stress is discussed.--Copyright 1974, Biological Abstracts, Inc.
W75-03841

GROWTH OF ENGELMANN SPRUCE (PICEA ENGELMANNII) UNAFFECTED BY INCREASED SNOWPACK,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
H. L. Gary.
Arctic and Alpine Research, Vol 6, No 1, p 29-36, 1974. 5 fig, 2 tab, 13 ref.

Descriptors: *Dendrochronology, *Growth rates, *Snowpacks, *Snowmelt, *Mountain forests, *Cold regions, Coniferous forests, Forestry, Forest soil, Hydrologic cycle, Rime ice, Snowmelt water, Snow cover, Soil water, Soil-water plant relationships, Water yield improvement, Weather modification, Winds, *New Mexico.
Identifiers: Rio Grande, Blowing snow, Snowdrifts, Tree breakage.

Annual radial growth of spruce in a forest interior where a natural snowpack is 1 to 1.5 m deep was only a little greater than near the border of an old burn where a large snowdrift ranges from 3 to 4.5 m deep. Growth was studied in the Sangre de Cristo Mountains, northeast of Santa Fe, New Mexico. The shallow snow cover melts during May and early June, while the deep snowdrift persists until late July or early August. Tree diameters averaged 24 to 30 cm and basal areas averaged 49 and 58 sq m ha to the minus one for deep and shallow snow sites, respectively. The results provide a good basis for speculating that weather modification programs to increase snowfall in the Southwest will have little detrimental effect on the annual or long-term radial growth of the existing forest stands.
W75-03844

LUCERNE IN WET SOILS: THE EFFECT OF STAGE OF REGROWTH, CULTIVAR, AIR TEMPERATURE AND ROOT TEMPERATURE,
Department of Primary Industries, Brisbane (Australia).
D. G. Cameron.
Aust J Agric Res, Vol 24, No 6, p 851-861, 1973.
Identifiers: *Air temperature, Cultivars, Damage, Flooding, Growth, *Lucerne, Medicago-sativa, *Root temperature, Soils, Temperature.

'Hunter River' lucerne (Medicago sativa L.) grown in pots, was subjected to either 21C or 33C constant temperatures for the 1st 10 days of regrowth. At 33C, flooding immediately after cutting killed 85% of the plants. Flooding 5 days after cutting killed 35% of the plants. Even when plants were not killed by flooding at 33C they were severely checked, and made negligible regrowth during the next 30 days. At 21C no plants were killed by flooding. Plants flooded immediately after cutting were severely checked but those flooded 5 days after cutting were similar to the unflooded controls. 'Hunter River' lucerne flooded under all combinations of 20C and 30C air and root temperatures for the 1st 5 days after cutting was more severely affected at both root temperatures than Rhizoma and Lahontan lucernes. High root temperature during flooding had a severe effect on all cultivars, but high air temperatures did not affect flooding reaction. Possible mechanisms by which flooding occurs are discussed.--Copyright 1974, Biological Abstracts, Inc.

SNOW-VEGETATION RELATIONSHIPS IN THE FOREST TUNDRA OF NOUVEAU-QUEBEC, HUDSON BAY, (IN FRENCH),
Laval Univ., Quebec. Centre d'Etudes Nordiques.
S. Payette, L. Filion, and J. Ouzilleau.
Nat Can (Que), Vol 100, No 5, p 493-508, 1973, English summary.
Identifiers: Bays, *Canada(Hudson Bay), Cryptograms, *Forest tundra, Herbs, Krummholz subzone, New Quebec, *Soil-water-plant relationships, Snow, Soils, Tundra, Vegtation.

During the winter 1973, a snow study was undertaken at Poste-de-la-Baleine and Richmond Gulf, Nouveau-Quebec (Canada). There exists a strong relationship between snow cover properties and vegetation in the forest-tundra. Within defined topographic units, low vegetational structures, such as herbaceous and cryptogamic formations, have denser and more variable depth of snow cover than high vegetational structures, such as shrub and tree formations. These differences depend on the process of snow saturation in the environment; this process is influenced by the nature and the spatial pattern of structural types of vegetation. Pattern of snow distribution is similar to pattern of major structural elements of the hemi-arctic landscape. Soil conditions at Poste-de-la-Baleine and in the forest subzone at Richmond Gulf seem more restrictive than snow conditions for regional expansion of forest formations. But snow influence is more pronounced in the krummholz subzone of Richmond Gulf.--Copyright 1974, Biological Abstracts, Inc.

2J. Erosion and Sedimentation

SEDIMENT IN STREAMS AND ITS EFFECTS ON AQUATIC LIFE,
Idaho Univ., Moscow. Coll. of Forestry, Wildlife and Range Sciences.
T. C. Bjornn, M. A. Brusven, M. Molnau, F. J. Watts, and R. L. Wallace.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 594, $4.25 in paper copy, $2.25 in microfiche. Completion Report, Idaho Water Resources Research Institute, Moscow, October 1974. 47 p, 19 fig, 11 tab, 10 ref. OWRT B-025-IDA(1). 14-31-0001-3876.

Descriptors: Effects, Sediments, Aquatic insects, Trout, Salmon, Insect drift, Benthos, Idaho, Carrying capacity, *Sediment transport, Fish food organisms, Streams, Chinook salmon.
Identifiers: *Idaho batholith, Steelhead trout, Bedload sediment, Mountain streams, Diversity indices, Substrate material.

Natural streams were surveyed, laboratory experiments were conducted, and sediment was added to a natural stream from July 1972 to June 1974 to assess the temporal and spatial impact of granitic bedload sediment (< 1/4 inch) on insect and fish populations, and on the capability of the streams to transport sediment. Juvenile chinook salmon and steelhead trout were not adversely affected during the summer when sediment comprised up to 52% of the substrate in riffles. Reduction of pool area or volume in a small stream resulted in a reduction in summer capacity for fish proportional to the percentage of pool area or volume lost. Winter capacity of experimental streams for age-0 steelhead trout and chinook salmon was reduced when the riffles were fully sedimented. Addition of sediment to riffles temporarily reduced insect species diversity indices, but no reduction in insect abundance was observed. The Meyer-Peter Muller formula appears most applicable to estimate sediment transport capabilities of mountain streams in the Idaho batholith. Sediment transport during the summer, low flow period was negligible in the streams studied.

MECHANICAL REEF,
J. Karnas.
US Patent No 3,845,630, 5 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 55, November 5, 1974.

Descriptors: *Patents, *Shore protection, *Reefs, *Beach erosion, *Coastal structures, Structures, Sedimentation, Offshore platforms, Erosion, Deposition.
Identifiers: Artificial reefs, Wave action.

The mechanical reef is adapted for use in water of substantial depth (100 feet and more). As the amount of sand and particulate matter deposited below and in front of the reef increases, new sections of reef can be added periodically to previously installed sections in order to increase the height of the reef. When used in this manner, the mechanical reef makes it possible to create an accumulation of solid material in water of substantial depth and to build-up the accumulation to water level. The mechanical reef can be installed parallel to the area to be protected such as the shoreline, and can be used to effect a gradual widening of the shoreline. In this case it is desirable to extend the ends of the reef into the shore at the termination points in order to preclude wave movement behind the reef. The new reef is also adapted to be installed in circular or other patterns which will be effective to protect a selected area, for example, offshore drilling equipment, etc., from wave assult. (Sinha-OEIS)
W75-03738

ANTI-EROSION DEVICE,
J. D. Williams, Sr.
U.S. Patent No. 3,844,125, 4 p, 10 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 1839, October 29, 1974.

Descriptors: *Patents, *Erosion control, *Beach erosion, *Shore protection, *Wind erosion, Equipment, Windbreaks, Tides, Conservation, Reclamation, Resources, Recreation.
Identifiers: *Wave action, *Wind effects.

Apparatus for controlling erosion of the earth primarily in sound and beach areas by water and wind is described. The apparatus includes a frame having a substructure to be embedded in the earth and a superstructure for trapping and retaining earth which is being displaced by either water or wind. The superstructure is mounted on a frame and extends upward. It consists of parallel rows of vertically disposed posts. The posts are staggered so that water or wind follows a tortuous path and sediments are trapped and a sediment build-up occurs. Along coastal areas, the structure can be emplaced either in the water or on the beach to resist erosion. (Sinha-OEIS)
W75-03742

BEACH-PROTECTORS,
W. Stiles, and G. V. R. Dunan.
U.S. Patent No. 3,842,606, 3 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 927, No 4, p 1352, October 22, 1974.

Descriptors: *Patents, *Beach erosion, *Shore protection, *Erosion control, Surf, Equipment, Beaches, Recreation, Reclamation, Conservation, Resources.

Used pneumatic type tires are arranged in horizontal and vertical rows, the vertical rows having contact with the beach to be protected, those tires in the horizontal rows being slightly elevated above the beaches. All the tires are interlocked forming a mat having solids and walled voids. Sand is deposited both in and around the tires as the surf tumbles shoreward and again as the swash and undertow gravitates seaward. The tires also form a flexible and resilient barrier to protect the beach from the turbulent waters of the surf. (Sinha-OEIS)
W75-03748

REINFORCED MATTRESS FOR PROTECTING SHORELINES AND THE LIKE,
B. A. Lamberton.
U. S. Patent No. 3,837,169, 5 p, 10 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 926, No 4, p 1181-2, September 24, 1974.

Descriptors: *Patents, *Erosion control, *Shore protection, *Beaches, *Beach erosion, Equipment.

A form for use in construction of an erosion control mattress or the like comprises a pair of sheets of flexible material having mutually facing interior surfaces and upper and lower cord systems, each comprising a plurality of intersecting flexible cords. Individual fasteners secure the upper cord system to one of the sheets and the lower cord system to the other sheets. The form constructed in this manner may be injected with a cementitious slurry which will inflate the form with the cord permitting separation of the two sheets for a substantial but controlled amount. ON THE CHOICE OF METHODS FOR THE PREDICTION OF THE WATER-ACTIVITY AND ACTIVITY COEFFICIENT FOR MULTICOMPONENT AQUEOUS SOLUTIONS,
Ecole Polytechnique, Montreal (Quebec). Department de Genie Chimique.
J. Sangster, and F. Lenzi.
The Canadian Journal of Chemical Engineering, Vol 52, No 3, p 392-396, June, 1974. 2 tab, 22 ref.

Descriptors: *Mathematical models, Solutions, *Electrolytes, Solutes, Thermodynamics, *Aqueous solutions, Model studies, Thermodynamic behavior.
Identifiers: Water activity, Solute activity coefficient.

Two important thermodynamic properties of aqueous solutions are the solute activity coefficient (gamma) and the water activity. A number of methods of predicting solute activity coefficient and water activity for multicomponent aqueous solutions exist. These vary by complexity, accuracy, and applicability. Methods of prediction discussed are those by Reilly, Wood, and Robinson (1971), Robinson and Bower (1965), Meissner and Kusik (1973), and Zdanovskii-Stokes-Robinson (1973). The first three are limited to solutions of electrolytes, while the fourth also applies to solutions containing non-electrolytes. (Prague-FIRL)

SELECTIVE DETERMINATION OF IRON IN ALLOYS BY REACTION WITH 2,3-PYRIDINEDIOL AND RING COLORIMETRY,
M.M.H. College, Ghaziabad (India). Dept. of Chemistry.
I. C. Mehra, and G. R. Chhatwal.
Analytica Chimica Acta, Vol 72, No 1, p 194-195, September, 1974. 1 tab, 2 ref.
Identifiers: *Analytical techniques, *Iron, *Metals, *Colorimetry, Chemical analysis, Testing procedures, Laboratory tests, Pollutant identification.

This study found that 2,3-pyridinediol can be more usefully and conveniently employed for the selective determination of iron, especially when present in trace concentrations, when it is used in conjunction with ring-oven colorimetry. The intensity of the ring determinations were compared with a standard scale, which had been prepared by taking 7 aliquots between 1 and 12 microliters of standard Fe(III) solution through the procedure. Tests carried out in the range 0.18-0.72 micrograms of Fe(III) gave results which showed errors ranging from 0 to 3%. The range for the determination of iron was 0.15-0.7 micrograms in the total ring; outside this range, visual comparison was not feasible. The validity of the procedure was tested for two different alloys after dissolution in hydrochloric acid. The interferences of various ions were studied by developing rings for 0.6 micrograms of Fe(III) in the presence of varying amounts of foreign ion up to 15 micrograms. (Pulliam-Vanderbilt)

PHOTOMETRIC TITRATION OF BERYLLIUM(II) WITH 5-SULFOSALICYLIC ACID,
Amsterdam Univ. (Netherlands). Lab. for Analytical Chemistry.
G. DenBoef, W. E. Van der Linden, and N. M. Saad.
Analytica Chimica Acta, Vol 69, No 2, p 469-472, April, 1974. 1 fig, 2 tab, 5 ref.

Descriptors: *Analytical techniques, *Spectrophotometry, *Beryllium, *Metals, *Chelation, Chemical analysis, Testing procedures, Laboratory tests, Volumetric analysis, *Pollutant identification.

Previous data had suggested that a selective photometric titration of beryllium(II) with 5-sulfosalicylic acid should be possible. No endpoint was expected for the titration at the point of 1:1 complex formation, since the ratio of the molar absorptivities of BeL2 and BeL is about 2 at all wavelengths. However, at 325 nm an endpoint was expected corresponding to 1:2 complex formation if certain requirements involving the product of the conditional stability constants, which could only be calculated roughly, and the Be(II) concentration were met. To prevent other metal ions reacting with the ligand under the experimental conditions or causing precipitation of hydroxides, EDTA or a similar compound was added as a masking agent. Results of determinations of Be(II) alone and in the presence of other metal ions supposed to complex with the ligand were presented. Iron(III) interfered because of the large absorption by the Fe(III)-EDTA complex at 325 nm. The optimal pH was found to be 9. Successful determinations could be carried out at the 0.0001 M level. The titration appeared to be rather selective, and could be increased by removing interfering metal ions. (Pulliam-Vanderbilt)

THE EXTRACTION OF NICKEL FROM VARIOUS SALT SOLUTIONS WITH OXINE IN CHLOROFORM,
Shizuoka Univ., Hamamatsu (Japan). Faculty of Engineering.
S. Oki, and I. Terada.
Analytica Chimica Acta, Vol 69, No 1, p 220-223, March, 1974. 3 fig, 1 tab, 4 ref.

Descriptors: *Nickel, *Alkali metals, *Salts, *Aqueous solutions, *Separation techniques, Laboratory tests, Testing procedures, Absorbance, *Pollutant identification.

The extraction of nickel from aqueous solutions containing various common inorganic alkali metal salts was studied by means of absorbance measurements of the organic extracts, and the results were compared with extraction from perchlorate solutions. The absorbance spectra of the nickel-oxine complexes extracted into oxine solutions in chloroform from the various salt solutions were practically the same as those from the perchlorate solutions. The absorbance by an excess of oxine was negligible at 400 mm. The absorbance-pH curves were essentially analogous to those of the perchlorate system; they had a low constant absorbance in the low pH region, but a high constant absorbance in the high pH region where nickel was completely extracted. The rising parts of the absorbance-pH curves differed from each other, depending on the kind and concentration of the salt used. (Jernigan-Vanderbilt)

THERMODYNAMIC PROPERTIES OF SEA SALT SOLUTIONS,
California Univ., Berkeley. Dept. of Chemical Engineering.
L. A. Bromley, D. Singh, P. Ray, S. Sridhar, and S. M. Read.
AIChE Journal, Vol 20, No 2, p 326-336, March, 1974. 4 fig, 9 tab, 27 ref.

Descriptors: *Thermodynamic, *Saline water systems, *Thermal capacity, Equations, Electrolytes, Enthalpy, Aqueous solutions.

Based on new experimental data presented for the boiling point elevation of natural sea water solutions, smoothed tabular values are presented for boiling point elevation (BPE), osmotic coefficient, water activity, osmotic pressure, and minimum separation energy to 200C and 12% sea salt. The concentration of sodium chloride solutions having the same water activities as sea salt solutions is also presented. Rigorous thermodynamics and the equations for strong electrolytes by Bromley (1973) were used for the correlation together with previously obtained heat capacity and enthalpy data and equations. A simplified equation is presented for boiling point elevation. (Snyder-California,Davis)

HYDROGEN EVOLUTION ON BETA III TITANIUM ALLOY,
California Univ., Los Angeles. School of Engineering and Applied Science.
D. L. Dull, and K. Nobe.
Corrosion, Vol 30, No 8, p 291-295, August 1974, (University of California Water Resources Center Project UCAL-WRC-S-144). 5 fig, 4 tab, 12 ref.

Descriptors: *Desalination processes, *Sea water, *Corrosion, *Titanium, Alloys, Metals, *Chemical reactions, Hydrogen, Hydrogen sulfide.

The rate of hydrogen evolution on Beta III titanium alloy in 1.0, 2.5, 5.0, 7.5, and 10.0 N sulfuric acid at 23, 45, 60, and 75 C (73, 113, 140, and 167 F) has been investigated. The cathodic Tafel slopes were 60, 64, 67, 70 mV, respectively, at each temperature. The reaction order was first order with respect to the concentration of hydrogen ions. The chemical recombination mechanism for the hydrogen evolution reaction using the Temkin adsorption with activated heat of adsorption is consistent with the experimental data. The corrosion rate increased with increase in both acid concentration and temperature. The activation energies for corrosion were 22.1, 20.8, and 19.3 kcal/mole for corrosion in 1.0, 2.5, and 5.0 N H2SO4, respectively, and 15.9 kcal/mole in 7.5 and 10.0 N H2SO4. (Snyder-California,Davis)

STREAM CHEMISTRY FOLLOWING A FOREST FIRE AND UREA FERTILIZATION IN NORTH-CENTRAL WASHINGTON,
Forest Service (USDA), Wenatchee, Wash. Pacific Northwest Forest and Range Experiment Station.
A. R. Tiedemann.
Available from Library Pacific Northwest For. and Range Expt. Sta., Box 3141, Portland, Ore. 97208. U.S.D.A. Forest Service Research Note PNW-203, 1973. 20 p, 8 fig, 1 tab, 23 ref.

Descriptors: Streams, *Fertilizers, Erosion control, Forest fires, *Water chemistry, *Nitrogen, *Nitrates, *Urea, Ammonia, Calcium, Magnesium, Sodium, Potassium, Hydrogen ion concentration, Alkalinity, Electrical conductivity, *Washington.
Identifiers: Entiat Experimental Forest(Wash).

During 2 years of study, nitrate-N in streamflow increased from background levels of 0.005 part per million (p.p.m.) in a control stream to 0.042 and 0.310 p.p.m. in streams from burned and burned, urea-fertilized watersheds, respectively. Cation concentration increased on the burned, unfertilized watershed, but because of dilution effects, decreased to levels of the control stream on the burned, fertilized watershed. Neither burning nor urea fertilization caused increases in nitrogenous constituents to levels above those recommended for municipal water supplies. Concentrations of nitrate-N observed indicate that losses of N in this form will have a negligible effect on future productivity of these forest ecosystems. (Forest Service)

Descriptors: *Saline water-freshwater interfaces, *Finite element analysis, *Mathematical models, Saline water intrusion, Parametric hydrology, Tidal streams, Coasts, Encroachment, Eddies, Mathematical studies, Streams, Flow, *Louisiana.
Identifiers: *Finite-difference model, Bayou Lafourche(La).

A parametric study of the flow of saline water intrusions which are driven into rivers by tidal fluctuations was accomplished with a mathematical model. Specifically, the saltwater intrusion at the bottom of Bayou Lafourche was studied. Empirical eddy transport was used, and available field data served as boundary conditions. The finite-difference model described unsteady flow variation in two spatial dimensions. The use of the third spatial dimension was not necessary to describe the physical phenomena governing the intrusion. (Jess-ISWS)

J. D. Thompson.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-778 761, $6.25 in paper copy, $2.25 in microfiche. Report No 121, March 1974. 141 p, 27 fig, 2 tab, 95 ref, 4 append. ONR NONR-N00014-67-A-0235-0002; NSF GA-29734.

Descriptors: *Upwelling, *Oceanography, *Coasts, *Model studies, Circulation, Oceans, Mixing, Movement, Ocean currents, Mathematical models, Continental shelf, Air-water interfaces, Water temperature, Numerical analysis, Stratification.
Identifiers: *Oceanic fronts.

Vertically-averaged equations for velocity, density, and thickness fields were formulated for a time-dependent, nonlinear, two-layer model of coastal upwelling. The model included the effects of the earth's rotation, bottom topography, an atmospheric pressure gradient, short and long-wave radiation, latent and sensible heat flux, horizontal and vertical turbulence, and both barotropic and baroclinic modes. Surface, interfacial, and bottom stresses and vertical mixing based on a parameterization of boundary and shear generated turbulence were incorporated in the model. Depth of the mixed layer, stratification, and sea surface temperatures were predicted explicitly. Solutions to the vertically-averaged momentum equations for the two-dimensional case were obtained using a highly efficient semi-implicit numerical scheme and a discrete variation telescoping grid which allowed high resolution near the coast. Upon reconstruction of the total flow fields for model cases with and without bottom topography, solar heating, and continuous wind forcing, several features observed in actual coastal upwelling situations were reproduced and investigated, including: (1) strong sea surface temperature gradients that ap-

pear within 10-50 km of the coast; (2) the equatorward surface jet that is found within the baroclinic Rossby radius of deformation of the coast and the poleward undercurrent which appears over the continental shelf; (3) the two cyclonically rotating cells reported by Mooers et al. (1973), as situated in a plane normal to and within 10-50 km of the coast. (Humphreys-ISWS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

FUTURE OF DESALTING IS BRIGHT BUT COSTS MUST DROP,
Water and Wastes Engineering, New York.
C. W. Heckroth.
Water and Wastes Engineering, Vol 11, No 7, p 20-23, 52-54, 1974. 15 fig, 1 tab.

Descriptors: *Water supply development, *Cost analysis, *Desalination, Water resources development, Desalination processes, Distillation, Membrane processes, Economic prediction, Desalination plants, Flash distillation.
Identifiers: Multistage flash process.

Desalting has become a growing source to meet increased water demand. In the U.S., over 800 desalting plants of over 25,000 gpd capacity are under construction or in operation. These units are capable of producing over 450 mgd of fresh water for cities and industries. Desalting has many advantages. In addition to supplying new water, it may also improve the water quality. Furthermore, it may provide an attractive form of drought insurance. A variety of processes are used in desalting with distillation furnishing most (95%) of the existing world capacity. About 2/3 of the capacity of the distillation plants use the multistage flash process. Distillation is used almost exclusively for desalting sea water, with membrane processes used only for brackish water. Graphic analysis of capital and operating cost is provided for an electrodialysis plant, ED plant, ion exchange plant, and a reversed osmosis plant. Desalting costs have reduced significantly over time, and are projected to drop even further. Several methods to reduce these costs are noted: (1) improved desalting technology, (2) reduction in energy costs, (3) more efficient use of energy, (4) geo-thermal plants, (5) economies of scale, and (6) staged construction. (Schroeder-Wisconsin)

U. Ermert, and H. D. Bauermann.
Meeresteckik, Vol 5, No 4, p 125-128, August, 1974. 6 fig, 4 ref.

Descriptors: *Reverse osmosis, *Filters, *Membranes, *Separation techniques, *Desalination, *Waste water treatment, Filtration, Equipment, Design.
Identifiers: Ultrafiltration, Plate and frame module, Wound spiral module, Pipe module, Hollow fiber module.

Beginning with the demarcation line between reverse osmosis (hyperfiltration) and ultrafiltration, the structure and materials of the usual types of membranes are discussed. The membranes are presented as complete modules. A comparison is made between the different modules including the plate and frame module, the wound spiral module, the pipe module, and the hollow fiber module. The various aspects of choosing membranes and modules are considered. (Orr-FIRL)

DISTILLATION APPARATUS,
Aqua-Chem, Inc., Milwaukee, Wis. (assignee)
A. B. Steinbruchel.
US Patent No 3,849,259, 10 p, 8 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 928, No 3, p 1209, November 19, 1974.

Descriptors: *Patents, *Desalination, *Evaporators, *Distillation, *Condensation, Sea water, Thin films, Equipment, Heat exchangers.

A thin film evaporator having a plurality of effects arranged in a vertical array and connected in a series relationship is described. Each effect includes heat exchange tubes through which vapor is passed while the feed liquid is distributed as a thin film over their outer surfaces. A portion of the liquid fed over heat exchange tubes as a thin film is vaporized to condense vapor passed through the tubes. The unevaporated feed liquid is passed through successive effects and the vapor generated in each effect is employed as the heating vapor for the next effect. The heat exchange tubes of at least one of the initial effects is arranged vertically and those in the balance of the effects are arranged generally horizontally and extend radially with their outlet ends facing condensate collecting chambers disposed within a central core. Feed water preheaters extend vertically through a plurality of collecting chambers with a feed liquid take-off for each phase. (Sinha-OEIS)

MULTISTAGE FLASH DISTILLATION,
General Atomic Co., San Diego, Calif. (assignee)
P. H. Sager, Jr.
US Patent No 3,844,899, 4 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 2081, October 29, 1974.

Descriptors: *Patents, *Desalination, *Distillation, *Flash distillation, *Evaporators, *Condensers, Evaporation, Condensation, Equipment, Sea water, Brine, Freshwater, Waste water treatment.

A parallel train, multistage flash evaporation unit requires only a single brine heater to provide the heat necessary for operation of all stages for all parallel trains. Operation of the system in the described manner results in increased capacity of the product output from heat input of particular conditions. The first incoming brine stream is heated and injected into the flash evaporation section of the highest pressure stage of the longest train. A second brine stream is heated by passage through the condenser sections of the longest train, withdrawn from the highest pressure stage,

and injected into the evaporation section of the highest pressure stage of the next longest train. The heated condenser streams from each train are likewise injected into the next shorter train. Each flash distillation stage includes an evaporation chamber or section into which the heated solution being treated is fed and caused to partially flash to vapor. A condenser section is located in the upper portion of each stage, and a distillate take-off system is disposed vertically below the condenser tubing to catch the condensed water which falls there via gravity. In each train the heated brine flows from right to left successively through the evaporation chambers of each stage in the train. At the same time, cooler brine is passed through the interconnected piping in the condenser sections flowing from left to right, in countercurrent flow to the direction of the heated brine. METHOD OF PREPARING WATER PURIFICATION MEMBRANES,
National Aeronautics and Space Administration, Washington, D.C.
J. C. Fletcher, J. R. Hollahan, and T. Wydeven.
U.S. Patent No. 3,847,652, 4 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 928, No 2, p 700, November 12, 1974.

Descriptors: *Patents, *Membranes, *Reverse osmosis, *Water purification, *Desalination, *Water reuse, Thin films, Freshwater, Potable water.
Identifiers: *Polymerization.

A process is described for the production of a reverse osmosis membrane. The membrane is prepared by plasma chemical synthetic methods that consist of disposing a microporous substrate in an enclosed space and generating a plasma of an inert gas within the enclosed space. The following steps consist of directing symmetrically a gaseous stream of an unsaturated organic compound including at least one allyl group toward and around the substrate and then directing the plasma symmetrically and countercurrently toward the gaseous stream and the substrate. The unsaturated organic compound is polymerized with the aid of the plasma and deposited on the substrate as a uniform polymer film to form the membrane. (Sinha-OEIS)

LONG TERM INVESTMENT CONSIDERATIONS OF CONJUNCTIVE DESALTING SYSTEMS,
California Univ., Los Angeles. School of Engineering and Applied Science.
J. M. English, and N. A. Young.
Desalination, Vol 13, p 359-371, 1973, (California Water Resources Center Project UCAL-WRC-W-305). 3 tab, 15 ref.

Descriptors: Economics, *Cost analysis, *Desalination plants, Aqueducts, *California, *Investment.
Identifiers: *Diablo Canyon(Calif).

Previous research which dealt with the desirability of considering water projects in a long range context, the measurement and costs of technological progress, and the value of preserving flexibility in future decision making has been combined and applied to the evaluation of the proposed prototype 40-mgd Diablo Canyon desalination plant. An alternative to the desalination plant is a very large scale aqueduct. In this paper the two projects are evaluated together as complementary components of a long range project against the alternative of earlier construction of the aqueduct. The analysis concerns the interest rate, growth rate, demand elasticity, planning horizon, number of planning periods, and area growth rate in parametric form. A simplified numerical example is given. (Snyder-California,Davis)

TWENTY YEARS OF WORK ON SOLAR DISTILLATION AT THE UNIVERSITY OF CALIFORNIA,
California Univ., Berkeley. Sea Water Conversion Lab.
E. D. Howe, and B. W. Tleimat.
Solar Energy, Vol 16, p 97-105, 1974, (California Water Resources Center Project UCAL-WRC-S-106). 8 fig, 13 ref.

Descriptors: *Solar distillation, *Solar distillation, *Desalination processes, Energy, *California, Distillation, *Research facilities, Laboratories, Potable water, Design, Desalination plants.

Solar Distillation investigations at the Sea Water Conversion Laboratory, University of California, began in January 1952 and have continued to the present time. These studies have led to the development of still units of relatively small size, designed for furnishing potable water to isolated residences or small communities. Designs have been completed using wooden frames, precast concrete frames, and precast styrofoam basins. Information is presented on the construction and performance of the several units; it indicates the need for more effective utilization of solar energy; and it offers a conceptual design of a solar collector for furnishing low-pressure steam for operation of a seawater distillation plant of advanced design with a capacity of 10,000 U. S. gal. (37 x 85 cu m) per day. (Snyder-California,Davis)
W75-03810

NEW MULTI-PROBE TEMPERATURE-PROFILE MEASUREMENT SYSTEM--THE 'THERMISTOR COMB',
California Univ., Berkeley. Sea Water Conversion Lab.
N. Lior, J. Leibovitz, and A. Laird.
SWCL Report No 73-2, Water Resources Center Desalination Report No 56, December, 1973. 7 fig, 5 tab.

Descriptors: *Desalination, Temperature, *Measurement, *Flash distillation, Instrumentation.
Identifiers: *Thermistors, *Temperature distribution, *Temperature differentials.

In many cases, a multi-probe simultaneous-measurement system has considerable advantages over a traversing-probe system. A detailed description of the design, development, and construction of such a multi-probe system, incorporating 0.25-mm-diameter thermistor beads mounted in 0.5-mm outside diameter hypodermic tubes, is presented. This system was used for the measurement of temperatures and temperature differentials in the determination of temperature distributions. Some of the techniques such as the welding, insulation and handling of fine wires (0.025 mm diameter, or one mil), are applicable in other systems. The system has been used to measure temperature distributions with an accuracy of plus or minus 0.02C in a model of a flash-evaporator stage used for research on distillation of saline water. The methods of measurement and experimental results are presented. Results indicate that the system is very well-suited for the determination of temperature distributions in single- and two-phase fluids (whether electrically conductive or not), particularly for small overall temperature differentials. CHAPARRAL CONVERSION POTENTIAL IN ARIZONA. I. WATER YIELD RESPONSE AND EFFECTS ON OTHER RESOURCES,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
A. R. Hibbert, E. A. Davis, and D. G. Scholl.
Forest Service Research Paper RM-126, July 1974. 36 p, 26 fig, 4 tab, 84 ref.

Descriptors: *Watershed management, *Arizona, *Chaparral, *Water yield improvement, Brush control, Soil erosion, Habitat improvement, Burning, Herbicides, Sediment yield, Erosion control, Land management, Arid lands, Forest fires, Wildlife, Brushlands, Chemcontrol, Forages, Grasslands, Water pollution, Streams, Browse utilization.

On areas favorable for treatment, conversion to grass reduces the fire hazard and increases water yield and forage for livestock. If treatment areas are kept small and interspersed with native chaparral, protective cover and browse for game animals will always be available nearby, and the edge effect created by the openings will enhance the overall environment for wildlife. Chaparral control methods that have proved effective in Arizona are rootplowing, prescribed burning, chemicals, and chemicals in combination with the others. Stream water from treated watersheds shows moderate to low contamination by herbicides. Over the long run, conversion should reduce erosion by reducing or eliminating the heavy erosion cycle set off by periodic wildfires in unmanaged chaparral. (See also W75-03573) (Witt-IPC)
W75-03572

CHAPARRAL CONVERSION POTENTIAL IN ARIZONA. II. AN ECONOMIC ANALYSIS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
T. C. Brown, P. F. O'Connell, and A. R. Hibbert.
Forest Service Research Paper RM-127, August 1974. 28 p, 3 fig, 10 tab, 22 ref.

Descriptors: *Chaparral, *Economic justification, *Cost analysis, *Arizona, *Watershed management, *Water yield improvement, Brush control, Erosion control, Habitat improvement, Burning, Herbicides, Arid lands, Brushlands, Grasslands, Forest fires, Wildlife, Recreation facilities, Soil erosion, Land management, Multiple-purpose projects, Forages, Browse utilization, Cost-benefit analysis, National forests.
Identifiers: Salt River(Arizona), Verde River(Arizona).

Chaparral covers approximately 850,000 acres on National Forest land in the Salt and Verde River Watersheds of central Arizona. An inventory revealed 139 chaparral areas totaling 332,796 acres that meet certain crown cover, slope, and managerial criteria for conversion. The costs of converting portions of these areas to grass and maintaining the conversion over a 50 year period were compared with the benefits to society in terms of increased water yield and forage for livestock, and reduced firefighting costs. Using fire as the main conversion tool, 96 acres have a benefit-cost ratio greater than 1; using a soil-ap-

plied herbicide, 72 areas meet that economic criterion. Proper management should favorably affect soil movement, wildlife habitat, and esthetics. Recreation use would be unaffected in most areas. (See also W75-03572) (Witt-IPC)

TWELVE BASIN INVESTIGATION: ANALYSIS OF POTENTIAL INCREASES IN PRECIPITATION AND STREAMFLOW RESULTING FROM MODIFICATION OF COLD OROGRAPHIC CLOUDS IN SELECTED RIVER BASINS OF THE WESTERN UNITED STATES. VOLUME 2,
North American Weather Consultants, Goleta, Calif.
R. D. Elliott, J. F. Hannaford, and R. W. Shaffer.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-232 132, $7.00 in paper copy, $2.25 in microfiche. Report No NAWC 15-18-2, December 31, 1973. 183 p, 20 fig, 6 tab, 4 ref, 2 append. Bureau of Reclamation 14-06-D-7368.

Descriptors: *River basins, *Weather modification, *Artificial precipitation, *Streamflow, *Data collections, *Meteorology, Cloud seeding, Precipitation(Atmospheric), Atmosphere, Hydrology, Orography, Snow, Snowpacks, Storm structure, Silver iodide, Nucleation, Runoff, Watersheds(Basins), Pacific Coast Region, Southwest US, Rocky Mountain region.
Identifiers: *Cloud seeding model.

Volume 2 presented the cloud seeding potential for increasing streamflow from five major river basins: Upper Missouri, San Joaquin, Deschutes, Bear-Wasatch, and Yakima. October-April hourly precipitation data were associated with appropriate rawinsonde data and the precipitation-cloud top temperature curves were plotted. From the curves, critical temperatures (for susceptibility to seeding) were determined for each massif. The area-of-effect model was employed in determining predicted seeded precipitation cloud top temperature curves, and the predicted curves were fitted to the historical curves based on the predicted not-seeded curve in the critical temperature and colder range. The seeding potential was then calculated from the difference between the predicted curve and the observed historical curve, and the frequency of cases. Mean elevations were specified for the upwind and downwind transition zones and crest zones. With the data, potential incremental streamflow was computed for 1951-1952 to 1970-1971. Details of the meteorological and hydrological approach were presented in Volume 1. Appendices contain extensive tabulations of data. (Humphreys-ISWS)

EFFECT OF SALT WATER INGESTION ON PREGNANCY IN THE EWE AND ON LAMB SURVIVAL,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Nutritional Biochemistry.
B. J. Potter, and G. H. McIntosh.
Australian Journal of Agricultural Research, Vol 25, No 6, p 909-917, November 1974. 2 fig, 3 tab, 23 ref.

Descriptors: *Sheep, *Reproduction, *Salt tolerance, *Stock water, Saline water, Animal physiology, Aging(Biological), Livestock, Animal pathology, Mortality, Water pollution effects, Australia.
Identifiers: Progesterone, Blood plasma, Ion concentration, Lamb survival.

The effect of drinking saline water on the reproductive performance of ewes was investigated with reference to age, circulating hormones, electrolytes and lamb survival rate. Pregnant sheep, particularly those carrying twin fetuses, appear to be less able to adapt to high levels of sodium chloride in drinking water than non-pregnant sheep, and the problem is exacerbated by increasing age. Progesterone levels in blood plasma were higher in twin-bearing ewes than in ewes with single lambs, and drinking saline water augmented the increase in older ewes. Plasma levels of potassium and chloride were higher and calcium and magnesium lower in pregnant ewes which received saline water. These changes in blood plasma composition were associated with complicated births, and neonatal mortality of lambs. (Levick-CSIRO)

SALT TOLERANCE IN THE WILD RELATIVES OF THE CULTIVATED TOMATO: WATER BALANCE AND ABSCISIC ACID IN LYCOPERSICON ESCULENTUM AND L. PERUVIANUM UNDER LOW AND HIGH SALINITY,
Negev Inst. for Arid Zone Research, Beersheba (Israel). Div. of Life Sciences.
M. Tal, and U. Gavish.
Aust J Agric Res, Vol 24, No 3, p 353-361, 1973.
Identifiers: *Abscisic acid, Conductivity, Density, Fluid, Guttation, Lycopersicon-esculentum, Lycopersicon-peruvianum, Resistance, Root, *Salinity, *Salt tolerance, Stomatal, *Tomatos, Transpiration, *Water balance, Wild.

The cultivated tomato L. esculentum and the more salt-tolerant wild species L. peruvianum were used. Transpiration of whole plants and detached leaves, stomatal density and opening, and abscisic acid level were measured for the 2 species grown under both control and saline conditions. Root resistance to water flow and conductivity of guttation fluid were compared only for plants growing in the control solution. Transpiration of whole plants was higher in wild plants grown in the control solution, but decreased more under salinity. Wild plants had fewer stomata per unit leaf area, but these opened wider in the control solution and closed more in the saline solution as compared with the cultivated ones. Root resistance to water flow and conductivity of guttation fluid were higher in the wild plants. The abscisic acid level was higher in the cultivated species and increased somewhat in both plant types under salinity. The significance of these findings in relation to the greater adaptability of L. peruvianum to stress is discussed.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF SALINE DRINKING WATER ON MINERAL BALANCES IN SHEEP,
Commonwealth Scientific and Industrial Research Organization, Adelaide (Australia). Div. of Nutritional Biochemistry.
F. M. Tomas, G. B. Jones, B. J. Potter, and G. L. Langsford.
Aust J Agric Res, Vol 24, No 3, p 377-386, 1973.
Identifiers: Excretion, Filtration, Glomerular, *Mineral balance(Animals), Plasma, *Saline water, *Sheep, Urin, Potable water.

The influence of NaCl ingestion via the drinking water upon the mineral balance in sheep was examined. Merino ewes (4) were offered rainwater containing zero, 0.8 or 1.3% NaCl as the only source of drinking water. After correction for variations in mineral intake, the data showed that the urinary excretion of Ca, Mg, K, P, Na and chloride was increased by saline water ingestion. The fecal excretion of Ca, Mg and P was not affected by the inclusion of NaCl in the drinking water, but fecal K was decreased and Na and chloride increased. The drinking of saline water by the sheep resulted in a decline in the Ca, P and K balances, an increase in the Na and chloride balances, and no change in the Mg balance. The Na balance was negative for the rainwater treatment, but all other balances were positive. Saline water ingestion also caused an increase in the glomerular filtration rate, a decline in plasma Mg levels and an increase in plasma K levels. Saline water ingestion causes alteration in the pathways of excretion of minerals and the mineral balances in sheep, but the changes would appear to be of insufficient consequence to have detrimental effects.--Copyright 1974, Biological Abstracts, Inc.

HYDROMETALLURGY,
Pennsylvania State Univ., University Park. Metallurgy and Mineral Processing Sections.
F. F. Aplan.
Society of Mining Engineering, Vol 26, No 2, p 70-72, February 1974. 32 ref.

Descriptors: *Metallurgy, *Research and development, *Heavy metals, *Separation techniques, Trace metals, Copper, Nickel, Zinc, Gold, Cobalt, Industrial wastes, Sulfur compounds, Recycling.
Identifiers: *Hydrometallurgy.

Hydrometallurgy is currently the fastest growing segment of the mining profession. Environmental factors have forced consideration of these processes which might mitigate the SO2 off-gas problem of conventional smelters, but the ever-increasing demand for metals probably plays the greater role. Copper is the most active area of research and many alternative processes to the traditional sulfuric acid-iron sulfate leach have been proposed. Magnetic separation and chemical refining recover pure nickel from the cemented product. The Japanese propose a chlorination-volatilization process for lateric ores followed by conventional solution chemistry to recover the nickel. Interest in zinc hydrometallurgy has been sparked by two new zinc smelters, both using electrolysis. Recent dramatic increases in the price of gold have sparked renewed interest in gold recovery processes. As far as environmental considerations go, the mining industry has committed much effort to the search for solutions to the smelting problems associated with copper and other ores. Hydrometallurgy has proven to be valuable in this endeavor. (Jernigan-Vanderbilt)

RELATIONSHIPS BETWEEN MOISTURE AVAILABILITY AND NITROGEN RESPONSE IN WINTER WHEAT,
Kansas State Univ., Manhattan. Dept. of Agronomy.
R. L. Vanderlip, L. S. Murphy, D. A. Whitney, and C. A. Thompson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 635, $3.75 in paper copy, $2.25 in microfiche. Kansas State University Agricultural Experiment Station, Research Paper 20, April 1974. KWRRI Contribution No 99. 37 p, 9 fig, 10 tab, 40 ref, append. OWRT A-022-KAN(2). 14-01-0001-1635.

Descriptors: *Soil moisture, *Wheat, *Nitrogen, *Rainfall, *Regression analysis, Estimating, *Kansas, Equation, *Forecasting.
Identifiers: *Winter wheat, Seeding rate, Soil nitrogen.

Multiple regression techniques were used to obtain prediction equations relating wheat response to applied nitrogen, soil moisture, rainfall, soil nitrogen content, variety, and seeding rate. Yield variability could be significantly related to these variables in both central and western Kansas. However, coefficients of determination were approximately 0.9 for western Kansas and 0.7 for central Kansas. All variables considered were important in accounting for variability in yields. Crop variables contributed most to prediction followed by moisture and soil nitrogen variables. Applied nitrogen was significantly related to yield; however, it contributed least to the prediction equations. Measured soil moisture at the experimental sites and estimated soil moisture as provided by the Kansas Crop and Livestock Reporting Service each were effective as soil moisture variables as measured by coefficients of determination. However, they did not result in consistent predicted effects of applied nitrogen, spring rainfall or to soil moisture itself. It is anticipated these or similar equations could be used to provide a guide for spring application of nitrogenous fertilizer.

WATER CONSERVATION IN THREE GRAIN CROPS IN THE ZAMBEZI VALLEY,
Department of Agriculture, Lusaka (Zambia).
O. Honisch.
Exp Agric, Vol 10, No 1, p 1-8, 1974.
Identifiers: Bulrush millet, *Grain crops, Infiltration, Seedbeds, Sorghum, *Zambia(Zambezi Valley), *Water conservation, Corn(Field).

The results of a 3-yr water conservation trial in the Zambezi Valley of Zambia are reported, for an area characterized by high temperatures and low,

often poorly distributed rainfall, with low infiltration and high evapotranspiration rates. As a result of these conditions local farmers often produce grain crops yielding as little as 200-300 kg/ha, though considerable increases could be obtained by simple water conservation methods. Of 4 treatments, tie-ridges made before the start of the 1st rains consistently gave the heaviest yields. Mean yields of the 3 crops under trial (maize, sorghum and bulrush millet) were higher on tie-ridges than on conventionally prepared seedbeds by 168, 159 and 17% in the 1968-69 to 1970-71 seasons, respectively.--Copyright 1974, Biological Abstracts, Inc.

PHYSIOLOGICAL ANALYSIS OF THE RESPONSE OF SORGHUM HYBRIDS 'CSH-1' AND 'CSH-2' TO RAIN-FED CULTIVATION,
Indian Agricultural Research Inst., New Delhi. Div. of Plant Physiology.
A. K. Bagga, M. M. Ghare, and R. D. Asana.
Indian J Agric Sci, Vol 43, No 3, p 225-229, 1973.
Identifiers: *Cultivation, Grain, Growth, Hybrids, Moisture, *Physiological analysis, Seasonal, *Sorghum hybrids, Sorghum-bicolor, Temperature, Crop yields.

Hybrid sorghum 'CSH 2' (Sorghum bicolor (L.) Moench) produced higher grain yield than hybrid 'CSH 1' under irrigation, but equal or less yield under rain-fed cultivation. The crop-growth rate, the leaf-area index and the net assimilation rate during the stage of maximum leaf area were similar in both, but 'CSH 2' had a taller stem and higher dry weight than 'CSH 1' at anthesis. 'CSH 2' had consistently higher grain number per panicle, but owing to its late-flowering habit its grain developed much later after the cessation of rains at lower temperatures and under greater moisture stress, with the result that the single-grain weight was sometimes reduced under rain-fed condition. The emergence of panicle was also more hampered in rain-fed 'CSH 2.' Thus high grain number and flowering by the end of rainy season would be desirable for rain-fed cultivation.--Copyright 1974, Biological Abstracts, Inc.

UTILITY OF A SIMPLE SOIL WATER BUDGET MODEL IN AGRONOMIC RESEARCH: I. EFFECTS OF PLANT DENSITY, TIME-OF-SOWING AND FALLOW WATER ON AVAILABLE SOIL WATER UNDER SPRING WHEAT,
Thai-Australian Colombo Plan Project, Chainat (Thailand).
R. G. Fawcett, and O. G. Carter.
Aust J Exp Agric Anim Husb Vol 13, No 65, p 714-717, 1973.
Identifiers: Agronomic research, Density, *Model studies, *Soil water, Sowing, Spring, Utility, *Water budget, *Wheat, *Australia.

A simple soil water budget model was used to estimate weekly changes in available soil water as affected by plant density, time of sowing and level of available fallow water for spring wheat cultivars grown on a black earth in northern New South Wales (Australia). Estimated values of available water were mostly within plus or minus 10 mm of observed values (ranging from 50-270 mm) obtained at 4 intervals during the growing season. The results are discussed in relation to both the interpretation of agronomic field experiments and use of the model in regions where conserved fallow water contributes significantly to cereal production.--Copyright 1974, Biological Abstracts, Inc.

PRODUCTIVITY IN DWARF WHEATS IN A SILT-LOAM SOIL AS INFLUENCED BY SOIL-MOISTURE REGIMES AND NITROGEN FERTILIZATION UNDER SHALLOW WATER TABLE CONDITIONS,
Govind Ballabh Pant Univ. of Agriculture and Technology, Pantnagar (India). Dept. of Agronomy.
Pyare Lal, and K. C. Sharma.
Indian J Agric Sci, Vol 43, No 3, p 255-261, 1973.
Identifiers: *Dwarf wheats, *Fertilization, Grain yields, Loam, Nitrogen, *Productivity, Silt, *Soil moisture, Water table, Wheats, *India.

Field experiments were conducted in the winter seasons of 1968-69 and 1969-70 at Pantnagar (India) to study the response of dwarf wheats ('Kalyan Sona' and 'Sonalika') to soil moisture regimes and N fertilization. The different soil moisture regimes (25, 50 and 75% depletion of available moisture) maintained after a common irrigation at crown-root initiation stage had no significant bearing on the yield, probably because of the shallow water table. Fertilization up to 100 kg N/ha increased the grain yield significantly. The response to N was quadratic in both the varieties. The most profitable levels of fertilization for 'Kalyan Sona' and 'Sonalika' were 133 and 156 kg N/ha in 1968-69 and 152 and 141 kg N/ha in 1969-70. The maximum net profit as a result of N application was higher in 'Kalyan Sona' than in 'Sonalika.'--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Shelterbelts, *Irrigation, Water balance, *Soil moisture, Evapotranspiration, Tensiometers, Water utilization, On-site investigations, Profiles.
Identifiers: *Norway, Neutron probe.

Results are presented of a water balance investigation on irrigated and non-irrigated plots at Lesja, an extremely arid area of North Gudbrandsdal, Norway. Wooden shelter belts were used across the valley and the prevailing wind direction. These belts were 60 cm high, 8 to 15 m apart, and were used to accumulate snow, prevent wind erosion, and to protect plants against heavy winds. Average yearly precipitation was 300 to 400 mm. Soil moisture measurements were made with neutron probes 8 times, 4 on irrigated and 4 on non-irrigated research plots. On each water treatment 2 profiles were located close to the shelter belts and 2 midway between. The distance between the shelter belts was 8 m. The soil was deep and the water holding capacity high. Values of actual evapotranspiration on all plots were presented. On irrigated fields the evapotranspiration was higher between shelter belts than at the shelter belts. Plant cover was well developed on all irrigated plots. The effect of the shelter belts on yield was about 10% on irrigated plots. The climate in the area is characterized by low humidity and high winds, and this may cause some oasis effect on the water use on the irrigated plots. (Roberts-ISWS)

IN SITU MEASUREMENTS OF LEAF WATER POTENTIAL AND RESISTANCE TO WATER FLOW IN CORN, SOYBEAN, AND SUNFLOWER AT SEVERAL TRANSPIRATION RATES,
Atmospheric Environment Service, Downsview (Ontario).
H. H. Neumann, G. W. Thurtell, and K. R. Stevenson.
Can J Plant Sci, Vol 54, No 1, p 175-184, 1974.
Identifiers: Corn(Field), Flow, Glycine-max, Helianthus-annuus, *Leaf water potential, Measurement, Roots, Soybean, Stalk, Sunflower, *Transpiration, *Hygrometry.

Peltier-cooled thermocouple dewpoint hygrometers were used to measure leaf water potentials at several transpiration rates on intact corn (Zea mays L.), soybean (Glycine max (L.) Merr.), and sunflower (Helianthus annuus L.), grown in a controlled environment in silica sand rooting media frequently watered with nutrient solution. Hygrometers were left in position for the duration of measurements on each plant, but tests showed this to have little effect on measured potentials. Measured potentials were linearly related to the transpiration rates (correlation coefficients greater than 0.98). Extrapolated values of leaf water potential at zero transpiration were within a few tenths bar of measured nutrient solution potentials. Plant resistances to water flow remained constant from near zero transpiration up to the maximum obtained average rates of 1.8-3.0 g dm-2 h-1. The magnitude of the resistance varied considerably from plant even within a single cultivar of 1 sp. and definite conclusions as to interspecies differences in resistance were not made. Estimates of the relative resistance in the root, stalk, and the leaf that were made for a few plants were similar to previously published results.--Copyright 1974, Biological Abstracts, Inc.

COMPARATIVE STUDY OF NITROGEN SOURCES FOR FERTILISATION OF RAINFED BAJRA,
Central Arid Zone Research Inst., Jodhpur (India).
D. L. Vyas, S. D. Singh, H. S. Daulay, and D. K. Misra.
Ann Arid Zone 11(3/4): 145-153, 1972.

Descriptors: *Nitrogen, Plant growth, Asia, *Fertilizers, Agricultural chemicals, Crop response.
Identifiers: *Bajra, India, Pennisetum-typhoides.

Sources of N did not influence the grain and stalk yields. N-treated plots indicated an increase in yield over the control, but the 3 units of N gave equal yields. The optimum dose of N for the local cultivar R.S.K. was 23.2 kg/ha. Any source of N can be used for bajra (Pennisetum typhoides) cultivation under natural rainfall conditions of the sandy arid plains of Rajasthan, India.--Copyright 1974, Biological Abstracts, Inc.

PRODUCTION AND UTILIZATION OF FODDER AND GRAIN SORGHUM AS FORAGE FOR CATTLE IN THE ORD RIVER VALLEY, WESTERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Kununurra (Australia). Div. of Land Research.
C. G. Blunt, and M. J. Fisher.
Aust J Exp Agric Anim Husb 13(62): 234-237, 1973.

Descriptors: Irrigation effects, *Forage sorghum, Crops, Field crops, Grasses, *Forage grasses, *Australia, *Cattle, *Grain sorghum, Animal growth, Growth rates.
Identifiers: Fodder.

Three experiments were carried out to obtain data on optimum water and N regimes for growing fodder sorghum: on cattle liveweight gains on irrigated fodder sorghum and grain sorghum regrowth and on cattle liveweight gains on green chop fodder sorghum in feed lots. Near maximum dry matter yields of fodder sorghum were obtained with 180 kg ha-1 N and 4-weekly irrigation. Fodder sorghum grazed at 6.4 and 4.0 head ha-1 for 26 wk gave mean liveweight gains of 0.36 and 0.41 kg head-1 day-1. Ratooned grain sorghum grazed at 4.0 head ha-1 gave 0.35 kg head-1 day-1, but was unable to carry 6.4 head ha-1. Green chop fodder sorghum fed at the preflowering and at the soft dough stages gave mean liveweight gains of 0.48 and 0.37 kg head-1 day-1 over 26 wk.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF ORGANIC MULCHES ON THE HYDROTHERMAL REGIME OF SOIL AND GROWTH OF POTATO CROP IN NORTHERN INDIA,
Punjab Agricultural Univ., Ludhiana (India).
S. S. Grewal, and N. T. Singh.
Plant Soil 40(1): 33-47, Illus. 1974.

Descriptors: *Mulching, *Potatoes, Crops, Dicots, Field crops, Vegetable crops, *Plant growth, Asia, *Soil temperature plastics, Irrigation practices.
Identifiers: Ethylene, *India, Mulches, Pennisetum, Typha, Polyethylene.

Possibilities of manipulating hydrothermal regime of soil with different organic mulches and their effect on the growth of potato crop was studied. Mulches like mat (Typha sp. interwoven into a web) and Pennistum stalks lowered the soil temperatures maxima at a depth of 10 cm by 1.5C during autumn and by 3.5C during spring as compared with control plots. Polyethylene mulch increased soil temperature maxima by 1.4C and 2.2C during autumn and spring, respectively and minima by 2.4C during both the seasons. This treatment saved 2 and the former treatment 1 irrigation each out of a total of 6 irrigations applied to control plots. During autumn polyethylene gave significantly higher yield as compared with other treatments. During spring, when both polyethylene and coal dust increased soil temperature, yields were low under these treatments and the tubers were malformed with many sprouts. The yield as well as tuber size were governed by minmum soil temperature during autumn but soil temperature maxima influenced both yield and quality in the spring crop. The possibility of manipulating soil temperature in order to improve quality and yield of potato crop under the climatic conditions of North India is pointed out.--Copyright 1974, Biological Abstracts, Inc.

LEAF WATER CONTENT AND POTENTIAL IN CORN, SORGHUM, SOYBEAN, AND SUNFLOWER,
Atmospheric Environment Service, Downsview (Ontario).
H. H. Neumann, G. W. Thurtell, K. R. Stevenson, and C. L. Beadle.
Can J Plant Sci 54(1): 185-195, 1974.
Identifiers: Age, Corn(Field), Glycine-max, Helianthus-annuus, *Leaf water potential, Sorghum, Sorghum-vulgare, Soybean, Sunflower, Wilting, *Hygrometry, Measurement.

The Peltier-cooled thermocouple dewpoint hygrometer technique of in situ measurement of leaf water potential was further developed. The observed response of the instrument agreed so well with theoretical analysis that calibration based on theory was within 1% of that obtained using salt solutions of known water potential. Simultaneous measurements with the hygrometer and a beta gauge were made to derive the leaf water content-potential relationships for several crop plants. Results showed relative water contents dropping only to near 0.95 for mature corn (Zea mays L.); sorghum (Sorghum vulgare Pers.); and sunflower (Helianthus annus L.) leaves, and to 0.90 for not quite mature soybean (Glycine max (L.) Merr.) leaves as potentials declined from near -1 bar to the plant wilting point (-8 to -14 bars). Further decline of leaf water potential resulted in relatively much greater loss of leaf water.--Copyright 1974, Biological Abstracts, Inc.

RESPONSE OF MYCORRHIZAL AND NON-MYCORRHIZAL ROOTED CUTTINGS OF HEATHER (CALLUNA VULGARIS(L.) HULL) TO VARIATIONS IN NUTRIENT AND WATER REGIMES,
Stirling Univ. (Scotland). Dept. of Biology.
P. Bannister, and W. M. Norton.
New Phytol, Vol 73, No 1, p 81-89, 1974.
Identifiers: Calluna-vulgaris, *Dry matter production, Growth rates, *Heather, *Mycorrhizal rooted cuttings, Nitrogen, Nutrients, Phosphorus, Potassium, Production, Roots, Fertilization.

Rooted cuttings of heather showed their best dry matter production in drained regimes with a frequent addition of nutrients. Mycorrhizal plants generally showed a decreased production when compared with equivalent non-mycorrhizal plants, except on drained regimes low in nutrients where the mycorrhizal plants grew better. Concentrations of N in the shoot and K and P in the root were higher in mycorrhizal than in non-mycorrhizal plants, effects most marked in well-drained regimes with the minimum addition of nutrients. In general, alterations in nutrient and water regimes had more significant effects on dry matter production than did the presence or absence of mycorrhiza. Mycorrhizal infection may have a beneficial effect in freely drained, infertile, soils that are characteristic of well-developed heathland.--Copyright 1974, Biological Abstracts, Inc.

DEFOLIATION, LEAF AREA INDEX, AND THE WATER USE OF FOUR TEMPERATE PASTURE SPECIES UNDER IRRIGATED AND DRYLAND CONDITIONS,
University of New England, Armidale (Australia). Dept. of Agronomy.
G. G. Johns, and A. Lazenby.
Aust J Agric Res, Vol 24, No 6, p 783-795, 1973.
Identifiers: *Defoliation, Dryland, Festuca-arundinacea, Irrigated soils, *Leaf area index, Lolium-perenne, Pasture species, Phalaris-tuberosa, Senescence, Transpiration, Trifolium-repens, *Water utilization, *Swards.

Measurements were made over a 12-mo. period of the water use and leaf area index (LAI) of both dryland and irrigated monoculture swards of 4 temperate pasture species (Trifolium repens, Lolium perenne, Festuca arundinacea and Phalaris tuberosa) under 2 defoliation regimes. All 4 species used similar quantities of water on the dryland plots despite large differences in their ability to grow under such conditions. Even though very dry conditions prevailed during part of the study, the dryland swards generally failed to exploit reserves of soil moisture below a depth of about 120 cm. The water use of the irrigated swards was sensitive to the manipulation of LAI by defoliation, while in contrast, dryland water use was not. On the irrigated swards, at an LAI of 1, a 1% decrease in LAI was associated with a 1% decrease in water use. This sensitivity of water use decreased as LAI increased until, at an LAI of 3 and above, water use appeared to be insensitive to charges in LAI. During the late spring to early autumn period both irrigated and dryland water use were significantly related to LAI. In this period, those irrigated and dryland swards which had common values of LAI generally used similar quantities of water. This finding indicated that stomatal control was ineffective in reducing water use per unit of leaf area. The quantity of dead herbage present in the swards suggests that pronounced leaf senescence (and hence reduction of leaf area) may have been a consequence of ineffective stomatal control of transpiration.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Drying, Chemical analysis, Nutrients, Digestion, *Aquatic weeds, *Water hyacinth, *Rooted aquatic plants, Animal physiology, Toxins, Feeds.

Up to 82% of the water hyacinth was removed from prepared plants by multiple pressings in a screen-lined cylinder with a low speed press. Plants as wet as 2089% dry basis moisture content were pressed to as low as 404% dry basis moisture content using pressures as low as 45 psi. A maximum of 0.35 horsepower-hour was required to remove a ton of water in single or multiple pressings. Water expression increased with increasing pressure, dwell time under pressure, pressure rise time and screen open area. Energy increased with increasing pressure and screen open area and decreased as rise time increased. Mincing increased expression and decreased energy requirement and cake moisture content. Chopped plants did not press satisfactorily without additional reduction; this reduction can be combined with the pressing process in devices such as screw presses. Regressions relating relevant expressions, moistures and energies to selected pressing variables were developed. (Morgan-Florida)

AQUATIC WEED HARVESTING COSTS AND EQUIPMENT--1972,
Aquamarine Corp., Waukesha, Wis.
C. B. Bryant.
Hyacinth Control Journal, Vol 12, p 53-55, May 1974. 3 tab, 2 ref.

Descriptors: *Harvesting, *Costs, Aquatic plants, *Aquatic weed control, Equipment, Machinery, Water pollution control, *Cost comparisons, Estimating, Labor.

Not until the mid-20th century have machines for harvesting aquatic weeds become commercially available. The design of the equipment has been generally uniform: a powered barge equipped with mounted underwater cutters in front of an inclined porous conveyor and a holding area for the harvested weeds, and a handling and/or transportation system to shore and trucks. Costs of harvesting depend on the equipment used and the location harvested. Results of a cost-and-performance questionnaire prepared for harvesting operations put into service after 1970 in six locations are summarized. Information requested for the 1971 harvesting season included acres harvested, tonnage harvested, transportation distances (both land and water), equipment used, movements between lakes, maintenance down time, type of weed harvested, and use of harvested weeds. Labor cost/ton varied significantly in the six locations surveyed, from $0.60 to $10.42, and labor costs/acre ranged from $10.00 to $28.18. Cost variations were traced to weed type, infestation density, transportation distance, and disposal requirements, as well as equipment. All but one location surveyed utilized Aquamarine equipment from which cost estimates were derived. (Schroeder-Wisconsin)

RAPID CREEK FLOOD HAZARD ANALYSES-(INCLUDING INMAN CREEK AND WEST FORK CREEK TRIBUTARIES) BANNOCK COUNTY, IDAHO.
Soil Conservation Service, Boise, Idaho.
June 1974. 22 p, 26 fig, 2 append.

Descriptors: *Flood plain zoning, Flood plains, Floods, *Watershed management, *Flood data, *Flood control, *Flood profiles, *Idaho, Flood forecasting, Flood damage, Flood plain insurance, Flood peak, Flood proofing, Water management, Water policy, Runoff, Snowmelt, Rural areas, Community development, Land use, Storm runoff, Regulations, Legal aspects.
Identifiers: Bannock Co.(Idaho), Rapid Creek(Idaho), Soil Conservation Service, Ordinances, Subdivision regulations, Flood plain management, Inman Creek(Idaho), West Fork Creek Tributaries(Idaho).

Increased flood damages to rural residences in Bannock County, Idaho, from Rapid Creek prompted a need to recognize and evaluate flooding risks. This study identifies flood hazard areas and provides a basis for further study and action to prevent or minimize flood damages. Convective thunderstorms produced from rising and cooling of moist air masses are the major cause of flooding; with runoff from winter storms and snowmelt as a secondary cause. Stream channel profiles, valley cross sections, aerial photos, and maps by the U.S. Geological Survey are included. Recommendations include that agriculture can continue to make effective use of the flood plain, flood insurance is needed, buildings must be protected by dikes and flood proofing, and dikes and levees must be constructed. A regulatory approach combining the use of flood lines or floodway zoning regulations to restrict types of development in high hazard areas is needed, together with zoning standards, building codes, or sanitary codes requiring minimum building protection elevations for uses in low hazard areas. In rural lands where floodplain zoning is not immediately possible, stringent sanitary codes and subdivision regulations could prohibit development in flood-prone lands. (Grden-North Carolina)
W75-03438

FLOOD HAZARD ANALYSES - CITY OF LISBON, RANSOM COUNTY, NORTH DAKOTA.
Soil Conservation Service, Bismarck, N. Dak.
Prepared in cooperation with City of Lisbon and the North Dakota State Water Commission, July 1974. 27 p, 21 fig, 2 tab, 10 plates.

Descriptors: Flood plains, Floods, *Watershed management, *Flood protection, *Flood control, Flood forecasting, Channel improvement, Dams, Flood recurrence interval, Floodproofing, Floodways, Levees, Flood plain insurance, Flow control, Warning systems, Insurance, Flood peak, Planning, Management, City planning, Historic floods, Floodwater, Runoff, Channels, *North Dakota.
Identifiers: *Flood plain management, Sheyenne River(ND), Lisbon(ND), Ransom County(ND), Flood plain regulation, Flood control measures.

Flood hazards in Lisbon, North Dakota, are identified to implement a local flood plain management program since flooding due to spring snowmelt runoff occurs in Lisbon about once every 10 years. Included are aerial photomosaic maps, high water profiles, and typical valley cross sections indicating the extent of flooding which can occur from the Sheyenne River which has a total drainage area of about 8,190 square miles above Lisbon with 5,700 square miles as noncontributing. With 1,440 acres within the corporate limits, a 50-year frequency flood will inundate approximately 325 acres (22 per cent of the city); a 100-year flood will inundate approximately 453 acres (31 per cent of the city); and a 500-year flood will inundate approximately 558 acres (39 per cent of the city). An elevation-frequency curve is also developed for the river at the Burlington Northern Railroad crossing which is typical of the river within the city. Recommendations to solve local flooding problems and develop a flood plain management program include installation of dikes and levees, adoption of local land use and zoning regulations for flood plain areas, flood proofing for existing and future buildings, application to the Federal Insurance Administration for flood plain insurance, installation of a flood warning system and use of flood plain areas for city parks and other open space uses. This technical information can aid in overall community planning and can be coordinated with the need to temporarily store and convey floodwaters. (Grden-North Carolina)

COLUMBIA DRAINAGE AND LEVEE DISTRICT NO 3, MONROE COUNTY, ILLINOIS (FINAL ENVIRONMENTAL STATEMENT),
Army Engineer District, St. Louis, Mo.
Available from the National Technical Information Service, Dept. of Commerce, Springfield, Va 22161 as EIS-IL-73-1259-F, $4.00 in paper copy, $2.25 in microfiche. September 1972. 32 p, 1 map, 3 tab, 7 append.

Descriptors: *Illinois, *Flow augmentation, *Drainage systems, *Pumping plants, Engineering structures, River, Budget, Cost-benefit analysis, Economic justification, Financing, Project planning, Direct benefits, Direct costs, Government finance, Federal government, Land resources, Social aspects, Wildlife conservation, Water resources development, Runoff, Levees, Seepage, Flood protection, Flood damages, Administration, Drainage, Crop production, Arable land, Agricultural engineering.
Identifiers: *Environmental Impact Statements, Administrative regulations, *Monroe County(Ill).

The estimated cost of construction of two pumping stations and appurtenant facilities on the Mississippi River in Illinois, is over $2,000,000. The project will provide flood protection to 9,000 rural acres. Even though the problem of direct flooding from the river has been largely eliminated by the levee system, there is still a problem with removing runoff and seepage. Substantial flood damage occurs when the gravity drainage system is blocked by high Mississippi River stages. In choosing the project design, economic factors were the primary consideration. Pumping and ditch capacities which provided the greatest excess of average annual benefits over annual costs were used. The project, when completed, will meet 1980 water resource needs. It will also make available increased land for urban, crop, and timber uses. The construction of the project will also provide employment and other economic benefits to the area. Local interests will provide without cost, all lands and easements necessary for the project. The project will have no adverse effect on water quality or wildlife populations of the area. REGULATION OF GREAT LAKES WATER LEVELS--APPENDIX G--REGULATORY WORKS--REPORT TO THE INTERNATIONAL JOINT COMMISSION.
International Joint Commission--United States and Canada. Great Lakes Levels Board.
Available from International Joint Commission, through Detroit District Corps of Engineers, PO Box 1027, Detroit, Mich. December 7, 1973. 213 p, 34 tab, 84 fig, 3 annex.

Descriptors: *Great Lakes, *Water level fluctuations, *International Joint Commission, *Engineering structures, *Evaluation, Lakes, Great Lakes region, Water levels, Discharge(Water), Regulated flow, Regulation, Water management(Applied), Comprehensive planning, Planning, Water policy, Water resources development, Structures, Economic feasibility, Environmental effects, Cost-benefit analysis, Governmental interrelations, United States, Canada.
Identifiers: *Environmental policy, *State policy, *Effluent limitations, *International agreements, Coastal zone management.

Engineering works are described which would be necessary to accomplish further regulation of the levels and flows of the Great Lakes, as described in the report on Regulation of Great Lakes Water Levels, dated December 7, 1973. Existing facilities for Lake Superior and Lake Ontario are described and the problems to be faced in providing new facilities, particularly in the outlet rivers of the presently unregulated Lakes Michigan, Huron, and Erie are discussed. Also described are the site investigations carried out, the design criteria and methods used, and the environmental factors considered in the preparation of preliminary designs and cost estimates of the works necessary for the various regulation plans considered in the Board's study. All necessary construction would be economically feasible, with the exception of work necessary to regulate the level of Lakes Michigan-Huron. The cost of required construction in the St. Clair-Detroit Rivers system far exceeds the estimated economic benefits of such regulation. (Deckert-Florida)

ALTERING ALABAMA'S HISTORY,
Soil Conservation Service, Auburn, Ala.
W. B. Lingle.
Soil Conservation, p 4-5, December 1973. 2 illus.

Descriptors: *Alabama, *Legislation, *Water supply, *Watershed management, *Reservoirs, Water policy, Siltation, Floods, Flood plains, Flood protection, Conservation, Recreation, Environment, Environmental effects, Impoundments, Impounded waters, Water management(Applied), Flood control.

In Alabama, projects to help reduce flooding and conserve resources are having a beneficial effect on the state. The Watershed Protection and Flood Prevention Act is inducing people to use flood-prone areas not only by protecting them from floods but also by offering opportunities for community growth and improvement. The city of Heflin is moving to take full advantage of its 84-acre multi-purpose watershed lake to attract new industry. In Randolph County, High Pine Creek was previously clogged with silt and debris. The creek flooded three to five times every year. People were leaving Roanoke and the surrounding area in droves. Sedimentation of Roanoke's water supply reservoir had reduced its capacity by one-third in seven years. Water rationing was normal during dry seasons. Today, 209 surface-acres of water are stored in nine flood detention reservoirs. The Choccolocco Creek Watershed Project near Anniston is another example of multiple-use of floodwater retarding structures. Multipurpose structures will provide recreation areas in Talladega National Forest and in the Cypress Creek watershed. These watershed projects offer many ways to improve both the environment and the economy of Alabama. (Ritchie-Florida)

HUMBOLDT HARBOR AND BAY JETTIES AND DREDGING, (FINAL ENVIRONMENTAL IMPACT STATEMENT).
Army Engineer District, San Francisco, Calif.
November 28, 1973. 60 p, 8 fig.

Descriptors: *Environmental effects, *Dredging, *Jetties, *Harbors, *California, Inlets(Waterways), Channel improvement, Spoil banks, Federal government, Bays, Rivers and Harbors Act, Breakwaters, Coastal engineering, Coasts, Coastal structures, Navigation, Disposal, Water quality, Benthic flora, Benthic fauna, Aquatic environment, Aquatic habitats, Oceans, Administrative agencies, Pacific Ocean, Water resources development.
Identifiers: *Environmental Impact Statements, *Humboldt Bay(Calif), *Coastal waters, *Offshore spoil disposal.

The project involves the rehabilitation and maintenance of rubble-mound jetties at the entrance to Humboldt Bay and maintenance dredging of the five channels in Humboldt Harbor and Bay, located on the northern coast of California. The dredge spoil is deposited offshore at a deep water disposal site approximately one mile from the entrance to the bay. Formerly a land locked harbor, the bay is quite shallow and continuous dredging is required to maintain the channels for navigation. Rehabilitation of the jetties has already been completed with no significant environmental effects. The dredging operation results in romoval of approximately 600,000 cubic yards of material annually, displacing immobile benthic organisms and causing temporary increases in turbidity in the bay and at the disposal site. The present site has been used for many years with no discernible change. The alternative of no action was not feasible due to the need to maintain the channels in order to allow continued operation of the harbor. While there is no significant opposition to the project, some concern has been expressed over the unknown effects of offshore spoil disposal. (Deckert-Florida)

REPORT OF PROCEEDINGS AT PUBLIC HEARING CONCERNING THE RECLASSIFICATION OF VARIOUS STREAMS IN THE CAPE FEAR (LOWER SECTION), LUMBER, NEUSE AND WHITE OAK RIVER BASINS.
North Carolina Dept. of Natural and Economic Resources, Raleigh. Office of Water and Air Resources.
Water and Air Quality Control Committees, Board of Water and Air Resources, June 1, 1974. 185 p, 13 tab.

Descriptors: *North Carolina, *River regulation, *Water quality standards, *Classifications, *Administrative agencies, Water law, Water policy, Water conservation, Water pollution, Water pollution control, Pollution abatement, Water quality control, Water utilization, Legislation, Water resources development, Regulation, Administration, River basins, River systems, Rivers, Streams, Tributaries, Legal aspects, Environmental effects, Decision making, Urban runoff.
Identifiers: Environmental policy, State policy, Administrative regulation.

Presented are copies of all written materials and a record of all comments and discussions presented during the public hearing on the proposed upgrading of classifications of certain waters in the Lumber, Neuse, and White Oak River Basins, and the lower sections of the Cape Fear River Basin. The hearing was conducted by the Water and Air Quality Control Committee of the North Carolina Board of Water and Air Resources. Comments were received from various representatives of federal, state and local government and private industry, as well as private citizens and environmental groups. There was considerable controversy over several of the reclassification proposals due to possible adverse effects upon local agricultural and industrial activities. It was also contended that certain streams would be unable to meet the higher water quality standards imposed by the upgrade due to urban runoff. Included are the specific

reclassification proposals, and sections of the Laws of North Carolina pertaining to state policy concerning its water resources and the assignment of classifications to surface waters. (Deckert-Florida)

THE HYDROLOGY OF A SMALL CATCHMENT BASIN AT SAMARU, NIGERIA: III. ASSESSMENT OF SURFACE RUN-OFF UNDER VARIED LAND MANAGEMENT AND VEGETATION COVER,
Institute for Agricultural Research, Zaria (Nigeria).
J. Kowal.
Samaru Res Bull 149. 120-133, Illus. 1972.

Descriptors: *Watersheds(Basins), Runoff, Agricultural runoff, *Surface runoff, *Runoff forecasting, Runoff coefficient, *Land management, *Vegetation.
Identifiers: *Nigeria(Samaru).

Results are given of a long-term field experiment designed to supplement water budget studies of a small catchment basin at Samaru, Nigeria, through assessment of surface run-off under varied land management practices and vegetation covers. The total annual run-off from cultivated land was considerably higher than that occurring in the catchment basin and ranged from 2.9 - 15.5 in. (74-394 mm) a year. Under natural vegetation the run-off was negligible and occurred only on 4 occasions during the 5 yr of the experiment. The highest run-off occurred from cropped land on 3-ft (0.9-m) ridges and from flat bare fallow, averaging 10.4 and 11.7 in (264 mm and 297 mm)/yr respectively. The lowest amount with an average of 5.5 in (140 mm)/yr occurred from cropped land with alternate tied ridges. Cropped flat land and ridged broadlands with alternate tied furrows yielded moderate run-off, averaging 8.5 in (216 mm)/yr. Data on rainfall characteristics are given and their relation with run-off is discussed.--Copyright 1974, Biological Abstracts, Inc.

PROPOSED LEGISLATION FOR ARTIFICIAL GROUNDWATER RECHARGE,
Florida Univ., Gainesville. Coll. of Law.
F. L. Gillette, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-230 089, $5.75 in paper copy, $2.25 in microfiche. Environmental Protection Agency Report, July 1972. 110 p, 185 ref, append.

Descriptors: *Artificial recharge, *Legislation, *Groundwater, *Water reuse, *Water resources, Water resources development, Water supply, Rehabilitation, Water treatment, Legal aspects, Reclaimed water, Waste water(Pollution), Water quality control, Regulation, Adoption of practices, Environmental effects, Environmental sanitation, Administration, Water policy, Florida, Water supply development, Water management(Applied).
Identifiers: Administrative regulations, State policy.

Much research has been conducted in the area of artificial groundwater recharge. The present scientific emphasis is placed on the total systems approach of recycling and reclaiming as much waste production as possible, especially water resources. Suggested legislation is presented, which is general in nature with details to be worked out by regulation. This article is divided into four parts: technological considerations, legal considerations, present legislation, and proposed legislation. Part one evaluates the technological complexities involved and lays the foundation on which the proposed legislation is predicated. Part two elaborates the legal problems involved and stresses the various possible liabilities incurred by anyone who attempts to use the process of artificial groundwater recharge. Parts three and four review current and proposed legislation. (Sperling-Florida)

POWER GENERATION FROM HOT BRINES,
Geothermal Investment Co., Pasadena, Calif. (assignee)
A. J. L. Hutchinson.
US Patent No 3,845,627, 6 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 54, November 5, 1974.

Descriptors: *Patents, *Heat flow, *Heat exchangers, *Heat transfer, *Groundwater, Specific gravity, Vapor pressure, Salts, Minerals, Steam, Oily water.
Identifiers: *Power generation, Power sources, *Geothermal wells, *Geothermal heat, Fluids, Gas expansion.

Hot fluid which may contain salts and other dissolved minerals is passed through a direct contact heat exchanger in heat exchange relationship with a heating fluid that has a specific gravity sufficiently below the specific gravity of the hot fluid that it may pass from the bottom to the top of the heat exchanger chamber in contact with the hot fluid. The pressure of the chamber is maintained above the vapor pressure of the hot fluid at the entering temperature of the fluid. The heat transfer fluid is selected so that the salts and other minerals in the fluid are insoluble in the heated heat transfer fluid. The heated heat transfer fluid is passed in heat exchange relationship with a working fluid that is vaporized in the heat exchangers and is subsequently passed through a power extracting gas expansion device. Alternatively, an oily substance is added to the hot fluid which may contain salts and other dissolved minerals, and the composition is passed through one or more surface contact heat exchangers for heating a working fluid. The oily substance coats the surface of the exchangers to prevent any mineral deposition. (Sinha-OEIS)

WATERSHED BEHAVIOR AFTER FOREST FIRE IN WASHINGTON,
Forest Service (USDA), Wenatchee, Wash. Pacific Northwest Forest and Range Experiment Station.
J. D. Helvey.
Available from Pacific Northwest Forest and Range Experiment Station, PO Box 3141, Portland, Oregon 97208. In: Proceedings of the Irrigation and Drainage Division Specialty Conference, Fort Collins, Colorado, April 22-24, 1973, p 403-422.

Descriptors: *Forest fires, *Washington, Water temperature, Precipitation(Atmospheric), *Forest watersheds, Burning, *Water yield, Debris avalanches, Vegetation, Watersheds(Basins), Measurement, Evapotranspiration.
Identifiers: Wildfire, Debris torrents.

More than 120,000 acres of forested land in North-Central Washington were burned in 1970, including the 4,620-acre Entiat Experimental Forest where hydrologic measurements began in 1961. Water yield increased 50% the first year after the fire because of reduced evapotranspiration losses. Stream temperature increased by as much as 10F. Record precipitation amounts, combined with minimal vegetative cover during the second post-fire year, triggered debris torrents which destroyed two stream gaging stations, but 27 inches of runoff were measured at the gaging station which survived. This was 360% of maximum annual runoff during calibration and 260% of yield during the previous year. (Forest Service)

OPPORTUNITIES FOR WATERSHED MANAGEMENT IN WYOMING,
Wyoming Univ., Laramie. Water Resources Research Inst.
P. A. Rechard.
In: Proceedings of the Irrigation and Drainage Division Speciality Conference, Fort Collins, Colorado, April 22-24, 1974, p 423-448. 9 fig, 21 ref. OWRT B-021-WYO(1).

Descriptors: *Wyoming, Water vapor, Precipitation(Atmospheric), *Rainfall-runoff relationships, Weather modification, *Watershed management, *Water yield improvement, Water supply, *Alternative water use, Management.

On an average day about 5 million acre-feet of water pass over the State of Wyoming in the form of water vapor. This amounts to almost 2 billion acre-feet per year. Of this quantity, approximately 80 million acre-feet fall on the state as precipitation during an average year, and about 15 million acre-feet run off in the streams and rivers. Proportionately, these figures indicate that only 4 percent of the precipitable water in the atmosphere above Wyoming falls as precipitation and of that, about 20 percent becomes streamflow. Rough as these figures are, they indicate that there are sizable quantities of water which might be convertet to supply by various techniques. The Wyoming Water Planning Program (1971) recognizes several viable alternatives for water supply development. Among those identified are: weather modification, which attempts to improve the efficiency of the precipitation processes, and watershed management techniques, which attempt to increase the amount of water made available to beneficial uses after precipitation occurs. Presented are some approximate quantities of water supply that might be made available in Wyoming under some selected watershed management practices.

EVOLUTION OF THE SMALL WATERSHED PROGRAM, CHANGES IN PUBLIC LAW 566--WATERSHED PROTECTION AND FLOOD PREVENTION PROGRAM, 1954-72,
Economic Research Service, Washington, D.C. National Resource Economics Div.
D. M. Lea, and C. D. Mattson.
Agricultural Economic Report No 262, June 1974. 58 p, 9 fig, 28 tab, append.

Descriptors: *Watershed Protection and Flood Prevention Act, *Evaluation, *Federal government, *Watershed management, *Small watersheds, Flood protection, Watersheds(Basins), Agricultural watersheds, Drainage, Drainage programs, Multiple-purpose projects, Local governments, Governmental interrelations, Water resources development, Irrigation, Recreation, Water policy, Water management(Applied), Administration, Non-structural alternatives, Water supply development, Industrial water, Municipal water, Wildlife, Management, Water supply, Governmental interrelations.
Identifiers: *Environmental policy, Administrative regulations.

The operation of the Small Watershed Program which provides federal technical and financial assistance for water management to local organizations is evaluated. From 1954 through 1972, the scope of the watershed program has expanded considerably, but flood protection for farm land remains its most significant feature. Congressional action during this time has expanded the program to include development of recreation, fish and wildlife resources, and municipal and industrial water supply. However, the watershed program has remained predominantly agricultural, with drainage and irrigation, as well as flood protection, comprising the most significant part of the program. Changes in the Small Watershed Program since its inception are identified and its varied emphases among different regions of the United States are measured. (Deckert-Florida)

SURVEY OF EROSION AND LAND USE WITHIN THE CATCHMENT AREA OF KEEPIT DAM (AUSTRALIA): PART 1 - CLIMATE, GEOLOGY, SOILS,
Soil Conservation Service of New South Wales, Sydney (Australia).
K. A. Emery.
Journal of the Soil Conservation Service of New South Wales, Volume 30, No 4, p 229-245, October 1974. 3 fig, 5 tab, 11 ref.

Descriptors: *Erosion, *Surveys, *Watersheds(Basins), *Australia, Sedimentation, *Reservoir silting, Soil surveys, Soil types, Rainfall disposition, Climatic data, Geological surveys, Geomorphology, Reservoirs, Silting, Silts.
Identifiers: *Keepit Dam(NSW), Namoi River(NSW).

Siltation of Keepit Dam, designed to regulate the annual discharge of water in the Namoi River, New South Wales, and of the watercourses within the catchment area, poses a threat to the economic viability of the Dam. A survey of erosion within the area was carried out in 1970-71 to allow for selection of sites for soil conservation treatment. The survey is discussed in terms of two physiographic regions of the catchment: a gently undulating area (Northern Tablelands) and an area of steeper, folded terrain (North Western Slopes). Detailed comparisons are provided of the climate, geology and soils of the two regions in relation to erosion hazard. The North Western Slopes, in particular, are characterized by gentle slopes rising abruptly to high ridges, the occurrence of high intensity storms during critical periods, and erodible soils. Available from Library Pacific Northwest Forest and Range Expt. Sta., Box 3141, Portland, Ore. 97208. U.S.D.A. Forest Service Research Note PNW-195, March 1973. 5 fig, 3 tab, 17 ref. PNW 1601.

Descriptors: *Revegetation, *Vegetation regrowth, *Erosion control, *Forest fires, *Fertilization, Nitrogen, Sulfur, Orchardgrass, Fescues, Timothy, Perennial rye grass, Clovers, *Washington.
Identifiers: Entiat Experiment Forest(Wash).

To determine regrowth of native species and the success of erosion control seeding and fertilization, vegetative cover measurements were made on permanent belt transects during 1971 on four watersheds severely and uniformly burned in 1970 that received the following treatments: seeded and fertilized with 57 kilograms per hectare of nitrogen as ammonium sulfate; seeded and fertilized with 54 kilograms per hectare of nitrogen as urea; seeded only; and control (no seeding, no fertilizer). Erosion control seeding improved first-year vegetative cover by up to one-third. Of the seeded species, orchard grass, hard fescue, and timothy provided most of the first-year cover. Perennial rye and yellow sweetclover showed poor development. Fertilizer did not increase vegetative cover but did improve vigor of seeded species. (Forest Service)

Identifiers: *Catchments, Climates, Coefficients, Ecology, Forests, Growth, *India(River Narmada), Lithology, Methods, Phytosociology, Rivers, Statistics, Terrain, *Vegetational analysis.

A systematic ecological survey of the native vegetation of the River Narmada Upper Catchment Area was executed in 4 phases for flood control and soil conservation. The 1st phase consisted of ecological survey of only the forest vegetation in the area. It deals with the situation, terrain, lithology, climate, general vegetation and methods of vegetational analysis. Vegetation was analyzed for phytosociological characters by quantitative methods and in total 22 associations were arrived at by an objective method of statistical computation of coefficient of variation of density and cover and finally computed by an Index of relative growth (RGI).--Copyright 1974, Biological Abstracts, Inc.

STUDY OF DRAINAGE PATTERNS IN THE MAHANADI CATCHMENT (ABOVE HIRAKUD DAM),
Indian Agricultural Research Inst., Nagpur. All India Soil Land Use Survey.
N. K. Shende, R. M. Pofali, and V. S. Deshmukh.
J Indian Soc Soil Sci 21(3): 323-327, Illus. 1973.

Descriptors: Asia, *Drainage patterns(Geologic), *Watershed management, Management, *Water sheds(Basins), Dams, *Erosian control.
Identifiers: *India(Mahanadi catchment).

Drainage pattern analysis in different landscape units furnishes useful information for watershed management with special reference to erosional features. The Mahanadi catchment, comprising an area of 84,000 km2, was analyzed for drainage pattern and drainage texture studies which revealed that the catchment exhibits the development of trellis, annular, rectangular, pinnate phantom, radia, dendritic and braided drainage patterns having fine to coarse drainage textures. In areas having fine textured dendritic pattern, the streams are excessively loaded with finer material of silt while in areas with pinnate, phantom and radial drainage patterns, the streams are charged with coarser material in the form of sand and gravel. Both the areas are the sore spots of erosion and conservation measures to check silt and sand load are imperative.--Copyright 1974, Biological Abstracts, Inc.

GAS CHROMATOGRAPHY OF VOLATILE METAL CHELATES: APPLICATION OF A NEW TECHNIQUE TO METAL ANALYSIS IN NATURAL WATERS,
Illinois Inst. of Tech., Chicago. Dept. of Environmental Engineering.
R. A. Minear, and S. Schneiderman.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 626, $3.75 in paper copy, $2.25 in microfiche. Illinois Water Resources Center, Urbana, Research Report No 94, 1974. 50 p, 15 fig, 7 tab, 32 ref. OWRT A-064-ILL(1). 14-31-0001-4013.

Descriptors: *Pollutant identification, *Analytical techniques, *Gas chromatography, Cadmium, Copper, Iron, Lead, Nickel, Zinc, Organic compounds, Water analysis, *Metals, Heavy metals, *Chelation.
Identifiers: *Metal chelates, Heavy metals analysis.

Originally, the application of commercially available monothiohexafluoroacetylacetone (HFAS) and its formation of volatile chelates with metals of environmental significance to rapid, multi-element analysis was under investigation. Inability to reproduce published results for the Nickel chelate led to critical examination of the chelating agent and ultimately to withdrawal of the compound from the commercial market when its identity and purity were found to be questionable. Independent synthesis of HFAS was unsuccessful and initial project objectives were abandoned. Project objectives were redirected to verification and extension of previous studies involving the lead chelate of 2,2,6,6-tetra-methylheptane-3,5-dione (PIV). Extraction studies were conducted using flameless atomization atomic absorption for analysis but are of questionable value as a result of analytical inconsistencies. Gas chromatographic studies indicated previously reported synthesis of Pb(PIV)2 had likely not been achieved. Both HFAS and PIV studies were unsuccessful and have resulted in programs of independent synthesis and continued research.

PESTICIDE ANALYSIS FROM URBAN STORM RUNOFF,
Nebraska Wesleyan Univ., Lincoln.
G. Dappen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 593, $3.75 in paper copy, $2.25 in microfiche. Addendum to Completion Report 'Water Quality Models for Urban and Suburban Areas', August 21, 1974, 40 p. OWRT A-025-NEB(2).

Descriptors: Water quality, *Urban runoff, Pesticides, *Storm runoff, *Pollutant identification, *Pesticide residues, Heptachlor, Chlorinated hydrocarbon pesticides, Rainfall.
Identifiers: Lindane, Dacthal.

Urban storm runoff was analyzed for pesticide content. Hexachlorobenzene (HCB), pentachloronitrobenzene (PCNB), heptachlor, heptachlor epoxide, lindane, and dacthal were identified and selected for monitoring. Lindane and dacthal were primarily used in the determination of the profile and runoff patterns during a rainstorm. Although pesticide concentrations were higher near the end of the runoff period, the largest amount of pesticide flushing from an area occurred during the maximum runoff period. Major rains, rains that followed periods of wet weather, or rains of longer duration produced higher quantities of pesticides running off than moderate rains of high intensity following dry periods. Much variation in the amount of pesticide running off was encountered. (See also W75-03311)

NATIONAL ENVIRONMENTAL RESEARCH CENTER - LAS VEGAS: A STAFF STUDY,
Environmental Protection Agency, Washington, D.C. Office of Research and Development.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-227 113, $4.75 in paper copy, $2.25 in microfiche. Report January 1973. 92 p, 8 fig, 11 tab, 2 append.

Descriptors: *Long-term planning, Environmental engineering, Planning, *Monitoring, Data collections, *Nevada, *Remote sensing, *Comprehensive planning, Bioindicators, Pollutant identification.
Identifiers: *Las Vegas(Nev).

Results of a comprehensive examination of the future mission of the Environmental Protection Agency's Las Vegas Office of Research and Monitoring (ORM) are summarized. Officially designated a National Environmental Research Center in 1972, the laboratory's primary thrust has been environmental engineering with present programs including sampling and monitoring activities, aerial surveillance, and remote sensing for a number of agencies in addition to EPA. The history of the laboratory, its organization, administrative services, personnel, and facilities are reviewed. Present monitoring programs are discussed. Seven NERC project areas are identified which can best be performed at the Las Vegas site: (1) aerial surveillance support, (2) development and field testing of aerial remote sensing devices, (3) biological monitoring of the

environment, (4) development and field testing of noise monitoring instruments, (5) development and demonstration of monitoring networks, (6) development of data interpretation techniques, and (7) special staff studies. Project examples to implement each of these program areas are demonstrated. (Schroeder-Wisconsin)

THE NASA ROLE IN MAJOR AREAS OF HUMAN CONCERN.
Denver Research Institute, Colo.
Available from the National Technical Information Service, Springfield, Va. 22161, as N73-25426. $3.25 in paper copy, $2.25 in microfiche. NASA Report NASA-CR-133049, February 1973. 17 p, 42 ref. NASW-2362.

Descriptors: *Pollution abatement, *Pollutant identification, Chemical analysis, Analytical techniques, *Monitoring, Measurement, Weather forecasting, Energy, Satellites(Artificial), Aircraft, *Remote sensing, Environmental effects, *Monitoring.
Identifiers: Energy conservation, Solar energy cells.

Attempts to integrate space technology and information gathering systems into environmental planning are reviewed. Much of this integration centers on joint efforts to develop pollution monitoring equipment. NASA Lewis Research Center is assisting Cleveland in developing an air pollution monitoring system; NASA Langley and Ames Research Centers are assisting California in assessing the impacts of aerosols and in applying NASA sensing technology to environmental and safety problems (forest fire detecting). NASA Ames Research Center has also participated with the Coast Guard in a program for detecting and determining the size of oil slicks via sensing devices. Other NASA programs have aided in the study of weather forecasting and the impacts of pollution on the weather as well as in the discovery and development of new energy resources. (Schroeder-Wisconsin)

TRANSURANIC SOLID WASTE MANAGEMENT RESEARCH PROGRAMS - QUARTERLY REPORT, JANUARY-MARCH 1974.
Los Alamos Scientific Lab., N. Mex.
Available from the National Technical Information Service, Springfield, Va. 22161, as Rept. No LA-5666-PR, $4.00 in paper copy, $2.25 in microfiche. Report No LA-5666-PR, July 1974. 27 p, 6 fig, 5 tab, append.

Descriptors: Management, *Radioactive waste, *Waste disposal, *Waste treatment, Waste storage, Transportation, Radioactivity effects, Corrosion, Corrosion control, Safety, Evaluation, Air pollution, Water pollution, Soil contamination, Public health.
Identifiers: Radiolysis, *Transuranics.

Progress is reviewed for three transuranic solid waste management research programs funded by the AEC Division of Waste Management and Transportation during the period of January-March 1974. The interim storage criteria for transuranic wastes have been redesignated as guidelines and will be issued as a Los Alamos Scientific Laboratory document after incorporation of final revisions. Studies of corrosion of mild steel in humid air have shown that Zinc Chromate Underseal, Chemical and Water-Resistant Restoleum Industrial Coating, and Rust Gard do not prevent corrosion. Analyses of the gaseous products of radiolysis of cellulosics contaminated with 1.2 mg 238Pu/g waste matrix have shown hydrogen and carbon dioxide to be the major products. Waste production is being evaluated on an individual process basis, and flowsheets are being prepared to show material input and waste output for each plutonium handling process. The Transuranic-Contaminated Solid Waste Treatment Development Facility has been redesigned to permit increased research ability and flexibility. The program to evaluate past burial practices has been redirected to emphasize local burial areas. Fluid dynamics computer codes are being evaluated for use in soil transport, atmospheric dispersion, and resuspension models. Agricultural and population data are being obtained for the areas surrounding Los Alamos. (Houser-ORNL)

CADMIUM UPTAKE BY WHEAT FROM SEWAGE SLUDGE USED AS A PLANT NUTRIENT SOURCE: A COMPARATIVE STUDY USING FLAMELESS ATOMIC ABSORPTION AND NEUTRON ACTIVATION ANALYSIS,
Karolinska Institutet, Stockholm (Sweden). Dept. of Environmental Hygiene.
L. Linnman, A. Andersson, K. O. Nilsson, B. Lind, and T. Kjellstrom.
Arch Environ Health, Vol 27, No 1, p 45-47, 1973, Illus.
Identifiers: *Absorption, *Atomic absorption, *Cadmium, *Neutron activation analysis, Nutrients, *Sewage sludge, *Wheat, Analytical techniques, Pollutant identification.

Wheat was grown in test pots at 4 different sewage sludge concentrations and 3 different pH levels in order to study the Cd uptake from sewage sludge. The sludge contained 10 ppm Cd, which is below the average Cd concentration in sludge from Swedish sewage sludge plants. The analysis of Cd in wheat was performed by 2 methods, atomic absorption and neutron activation analysis, and good agreement was found between results from the methods. The Cd uptake increases strongly with increasing sewage sludge concentrations. Cd from sewage sludge used as a plant nutrient source is resorbed by plants. The pH of the soil was of great importance for the uptake of Cd. Lower pH gave greater Cd uptake.--Copyright 1974, Biological Abstracts, Inc.
W75-03503

DETERMINATION OF MERCURY IN WATER AND PLANT MATERIAL BY FLAMELESS ATOMIC ABSORPTION,
Ghent Rijksuniversiteit (Belgium). Faculteit Landbouwwetenschappen.
L. Kiekens, M. Verloo, and A. Dhaese.
Meded Fac Landbouwwet Rijksuniv Gent, Vol 38, No 1, p 9-14, 1973.
Identifiers: Alfalfa, *Atomic absorption, Corn(Field), Leaves, *Mercury, Spinach, Tobacco, Water pollution, Sampling, *Pollutant identification, Water analysis, *Analytical techniques.

The possibilities of flameless atomic absorption for the determination of Hg in water and plant material (spinach, corn leaves, tobacco leaves and alfalfa) are described. For the destruction of plant material a rapid digestion procedure at relative low temperature is described, using a mixture of concentrated nitric and sulfuric acid with V2O5 as a catalyst. The detection limit of the method is about 0.15 ppb for water samples and 0.1 ppm in the dry matter for plant material.--Copyright 1974, Biological Abstracts, Inc.

MONITORING 2,4-D RESIDUES AT LOXAHATCHEE NATIONAL WILDLIFE REFUGE,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
D. P. Schultz, and E. W. Whitney.
Pestic Monit J, Vol 7, No 3/4, p 146-152, 1974, Illus.
Identifiers: Cassidix-mexicanus, Eichhornia-crassipes, Fish, *Florida(Loxahatchee National Wildlife Refuge), Gallinula-chloropus, *Monitoring, Mud, *National Wildlife Refuges, Pollution, Refuge, Weedicide, Wildlife, *2-4-D, *Pesticide residues, Water quality, *Pollutant identification, *Path of pollutants.

Over 7000 acres along the Hillsboro perimeter canal in Loxahatchee National Wildlife Refuge (NWR), Florida, were sprayed in 1971 with the dodecyl-tetradecyl amine salts of 2,4-D ((2,4-dichlorophenoxy) acetic acid) (DTA-2,4-D) at a rate of 4.48 kg acid equivalent (a.e.)/ha to control waterhyacinth (Eichornia crassipes). Three stations were established along the canal to collect samples of fish, water and mud for residue analysis and to monitor water quality. The initial application of 2,4-D, followed by spot treatments of DTA-2,4-D and/or the dimethylamine salt of 2,4-D (DMA-2,4-D) over a 4 mo. period, achieved excellent control of water hyacinth. The highest 2,4-D residue level measured in water (0.037 mg/l) was found on the day following the initial treatment. The highest levels in hydrosol (0.005 mg/kg) occurred 3-15 days after treatment. Among 60 samples of fish, 3 had herbicide residue levels greater than 0.010 mg/kg, 16 had less than 0.010 mg/kg, and the remainder had no detectable residue levels. Breast muscle and liver of common Florida gallinules (Gallinula chloropus) had residue levels of 0.30 mg/kg and 0.675 mg/kg, respectively, 1 day after spraying, and no detectable residues 4 days after spraying. The herbicide apparently caused no ill effects on hatching of boat-tailed grackle (Cassidix mexicanus) eggs or development of fledglings.--Copyright 1974, Biological Abstracts, Inc.

AUTOMATIC DOSAGE OF SULFATES BY AN IMPROVED NEPHELOMETRIC METHOD DOSAGE AUTOMATIQUE DES SULFATES PAR UNE METHODE NEPHELOMETRIQUE AMELIOREE),
nstitut d'Hygiene et d'Epidemiologie, Brussels (Belgium).
G. Verduyn, and A. Derouane.
Atmospheric Environment, Vol 8, No 7, p 707-715, July, 1974. 6 fig, 1 tab, 15 ref.

Descriptors: Automation, *Sulfates, Measurement, *Analytical techniques, Equipment, *Rain water, *Pollutant identification.
Identifiers: *Nephelometric methods.

An automatic nephelometric method for the determination of low concentrations of sulfate is described. It permits the determination of concentrations as low as 0.1 microgram per cu cm. Sulfate ions are precipitated by means of barium perchlorate and fifty samples can be analyzed in an hour. This method is applicable to the determination of sulfate amounts in rain water. The equipment used is a Technicon Auto Analyser, connected with a two monochromators spectrofluorimeter. (Prague-FIRL)

N AUTOMATED METHOD FOR DETERMINATION OF CHLORIDE AND SULFATE IN RESHWATER USING CATION EXCHANGE ND MEASUREMENT OF ELECTRICAL CONUCTANCE,
sheries Research Board of Canada, Winnipeg Manitoba). Freshwater Inst.
. P. Stainton.
mnology and Oceanography, Vol 19, No 4, p 7-711, July 1974. 2 fig, 5 tab, 6 ref.

escriptors: *Water analysis, *Chlorides, ollutant identification, *Sulfates, Freshwater, ation exchange, *Electrical conductance, Ion change, Water properties, Analytical chniques, Surface waters, Chemical analysis, trates, Fluorides, Iodides, Bromides, Halogens, ssolved solids, Salts.

A simple automated adaptation of Mackereth's manual method for determining chloride and sulfate in freshwater is described, using hydrogen ion-exchange to convert chloride and sulfate salts to their free acids with detection by electrical conductance. The use of silver-saturated exchange resin to precipitate chloride permits distinction between chloride and sulfate. Detection limit is good at 2 microequivalents/liter with excellent precision (plus or minus 1.5% at 200 microequivalents/liter). High levels of nitrate, orthophosphate, and fluoride gave positive interference for sulfate; bromide and iodide similarly interfere with chloride estimates. (Witt-IPC)

DETERMINATION OF TOTAL WATER HARDNESS BY CONDUCTOMETRIC TITRATION WITH COMPLEXING AGENTS (DETERMINAREA DURITATII TOALE A APEI PRIN TITRARI CONDUCTOMETRICE CU COMPLEXONI),
Institutul Politehnic, Iasi (Rumania).
N. Alelenei.
Buletinul Institutului Politehnic din Iasi, Sectia II: Chimie, Vol 20 (24), No 1-2, p 23-28, 1974. 3 fig, 1 tab, 8 ref. English summary.

Descriptors: *Water analysis, *Hardness(Water), *Water properties, *Analytical techniques, *Water chemistry, Volumetric analysis, Cations, Calcium, Magnesium, Iron, Aluminum, Copper, Manganese, Chelation, Nitrilotriacetic acid, Aqueous solutions.
Identifiers: Complexometry, Electroconductance, Conductometry, Chelating agents, Triethanolamine, Ethylenediaminetetraacetic acid, EDTA.

Triethanolamine, nitrilotriacetic acid, and the di- and tetrasodium salts of EDTA (ethylene-diaminetetraacetic acid) were used as complexing agents in low-frequency (50 Hz) conductometric titrations of total hardness in waters and dilute aqueous solutions. The tetra-sodium EDTA was buffered with sodium borate at pH 9-10. Triethanolamine permitted total hardness determinations in the presence of trivalent Fe and traces of divalent Cu and Mn. However, the presence of Al ions interfered with the titration of Ca and Mg. (Brown-IPC)

THE DETERMINATION OF ARSENIC BY NON-DISPERSIVE ATOMIC FLUORESCENCE SPECTROMETRY WITH A GAS SAMPLING TECHNIQUE,
Hitachi Ltd., Tokyo (Japan). Central Research Lab.
K. Tsujii, and K. Kuga.
Analytica Chimica Acta, Vol 72, No 1, p 85-90, September, 1974. 7 fig.

Descriptors: *Fluorescence, *Spectroscopy, *Arsenic compounds, *Analytical techniques, Metals, Testing procedures, Instrumentation, *Pollutant identification.

Arsenic was converted to arsine in a mixed acid medium containing iodide, tin (II) and zinc powder and was atomized in a hydrogen-argon-entrained air flame. A microwave-excited (2450 MHz) electrodeless arsenic discharge lamp, a solar-blind photomultiplier, and a lock-in amplifier were used. The burner slot configuration was shown to have an effect on the maximal fluorescence intensity. Three configurations were tried. The flame composition was not a critical factor regarding the fluorescence intensity when the argon flow rate was kept constant. However, the noise level was markedly affected by the flame composition, and the signal-to-noise ratio was improved with low flow rates of hydrogen. The burner height also had an effect on the fluorescence intensity. The detection limit of arsenic, defined as the quantity for which the signal-to-noise ratio was equal to 2, was 2 ng and the linear working range covered nearly 3 decades of concentration. A STUDY OF ADSORPTION CHARACTERISTICS OF TRACES OF CHROMIUM(III) AND (VI) ON SELECTED SURFACES,
Louisiana State Univ., Baton Rouge. Dept. of Chemistry.
A. D. Shendrikar, and P. W. West.
Analytica Chimica Acta, Vol 72, No 1, p 91-96, September, 1974. 3 fig, 1 tab, 9 ref.

Descriptors: *Water sampling, *Chromium, *Heavy metals, Laboratory tests, *Adsorption, Chemical analysis, Reliability, *Analytical techniques, Sampling, *Pollutant identification.

The losses of chromium (III) and (VI) due to adsorption on the walls of containers of pyrex, flint-glass and polyethylene were investigated. These materials were selected since they are very commonly used for sample storage purposes. Chromium (III) or (VI) solutions were stored in beakers at different hydrogen ion concentrations, and losses due to adsorption were measured at various contact times by counting the gamma-ray activity from chromium-51 radiotracer. At pH 6.95, chromium (III) solutions showed the greatest instability. In polyethylene beakers, losses reached 25% of the initial metal concentration in 15 days. Similar results for flint glass and pyrex were 19% and 17% respectively. Losses during a contact time of 24 hours were negligible. Chromium (III) solutions in 0.5% nitric acid as well as at a pH of 3.1 showed losses of less than 0.5% at the end of 15 days. The behavior of chromium (VI) showed a completely different pattern from that of chromium (III). Losses of less than 1.0% were observed on all three materials at the end of 15 days at pH 6.95. (Pulliam-Vanderbilt)

THE OPENING UP OF INSOLUBLE OXIDES (TANTALUM, NIOBIUM, CHROMIUM, ALUMINIUM, AND OTHERS), WITH LIQUID SELENIUM DIOXIDE,
Philips Gloeilampenfabrieken N.V., Eindhoven (Netherlands).
B. J. Mulder.
Analytica Chimica Acta, Vol 72, No 1, p 220-222, September, 1974. 5 ref.

Descriptors: *Analytical techniques, *Oxides, *Metals, *Solvents, Separation techniques, Solvent extractions, Testing procedures, Laboratory tests, *Pollutant identification.

Liquid selenium dioxide is a useful solvent for a large number of 'insoluble' oxides. Details were given for Ta205, Nb205, Cr203 and Al203, with directions for the preparation of aqueous solutions. Pyroselenites were derived from the cor-

responding oxides by substituting Se205 for oxygen. Although most metal oxides rapidly dissolved in, or reacted with, liquid selenium dioxide, silica in the form of quartz glass was much less reactive. Pyrex glass was attacked at about the same rate as quartz glass, but gave rise to contamination by a larger number of elements. For Cr203, there seemed to be no alternative method that left the chromium in the trivalent state. The only 'undissolved' oxide of those investigated was Sn02. An attractive feature of selenium dioxide is its high vapor pressure which permits purification by sublimation. (Pulliam-Vanderbilt)

MERCURY DETERMINATION AT THE MICROGRAM LEVEL BY A REDUCTION-AERATION METHOD OF CONCENTRATION,
Western Washington Research and Extension Center, Puyallup.
Y. Kimura, and V. L. Miller.
Analytica Chimica Acta, Vol 27, No 4, p 325-331, October, 1962. 1 fig, 3 tab, 9 ref.

Descriptors: *Mercury, *Analytical techniques, *Separation techniques, *Photometry, Aeration, Filtration, Tin, *Pollutant identification.
Identifiers: *Microanalysis.

A method for the determination of mercury using a concentrating aeration procedure at room temperature following digestion of the samples with sulfuric acid, hydrogen peroxide and potassium permangate was discussed. Its chief advantages were elimination of filtration, applicability to mercury solutions in sulfuric acid to 22N, nitric acid to 8N, and nitric and sulfuric mixtures to 4N and 8N respectively and ability to concentrate dilute mercury solutions during the process of mercury separation in order that the entire sample may be taken for analysis. Final analyses were made from solutions of constant composition and volume regardless of the original material and volume of the digest or solution. Mercury was concentrated during the separation and was determined by a direct photometric dithizone procedure. The technique was applicable for 0.10 microgram mercury per sample charge with a standard deviation for a single determination of 0.05 microgram mercury in the 0 to 0.5 microgram range. (Jernigan-Vanderbilt)

ATOMIC ABSORPTION SPECTROPHOTOMETRIC DETERMINATION OF MICROGRAM LEVELS OF CO, NI, CU, PB, AND ZN IN SOIL AND SEDIMENT EXTRACTS CONTAINING LARGE AMOUNTS OF MN AND FE,
Geological Survey, Denver, Colo.
T. T. Chao, and R. F. Sanzolone.
Journal of Research of the U.S. Geological Survey, Vol 1, No 6, p 681-685, November-December, 1973. 2 fig, 7 tab, 14 ref.

Descriptors: *Heavy metals, *Analytical techniques, *Soils, *Sediments, *Variability, Spectroscopy, Cobalt, Nickel, Copper, Lead, Zinc, Manganese, Iron, Instrumentation, *Pollutant identification.
Identifiers: Atomic absorption spectroscopy.

An atomic absorption spectrophotometric method was developed for the determination of seven metal ions in the hydroxylamine extract of soils and sediments. Mn, Fe, and Zn were directly determined in the aqueous extract upon dilution. Co, Ni, Cu, and Pb in a separate aliquot of the extract were chelated with APDC (ammonium pyrrolidine dithiocarbamate) and extracted into MIBK (methyl isobutyl ketone) before determination. Data were presented to show the quantitative recovery of microgram levels of Co, Ni, Cu and Pb by APDC-MIBK chelation-extraction from synthetic solutions containing as much as 2000 micrograms/ml Mn or 50 micrograms/ml Fe. Recovery of known amounts of the metal ions from sample solutions was equally satisfactory. Reproducible results were obtained by replicate analyses of two sediment samples for the seven metals. (Pulliam-Vanderbilt)

RADIORESPIROMETRY: RAPID TOXICOLOGICAL SCREENING OF ENVIRONMENTAL POLLUTANTS,
National Environmental Research Center, Cincinnati, Ohio. Environmental Toxicology Research Laboratory.
S. D. Lee, R. M. Danner, L. McMillan, W. Moore, Jr., and J. F. Stara.
News of Environmental Research in Cincinnati, October 11, 1974. 4p, 2 fig, 3 tab, 22 ref.

Descriptors: *Sulfur, *Analytical techniques, *Environmental effects, *Toxicity, *Mercury, Biochemistry, Metabolism, Respiration, Animal physiology, Laboratory animals, Testing procedures, *Pollutant identification.
Identifiers: *Radiorespirometry, Methylmercury.

The objective was to develop new techniques or to apply existing methods that are capable of detecting early biochemical lesions, before the appearance of overt toxic symptoms, resulting from low concentrations of environmental pollutants. Radiorespirometry is such a technique and was used to measure expired 14CO2 in a biological system metabolizing 14C-labeled compounds. CO2 excretion responds rapidly to changes in the metabolic alterations of the body. The effects of SO2 and methylmercury exposure on 14CO2 output were studied. Intragastric administration of methylmercury chloride 24hr before testing suppressed 14CO2 output following intravenous injection of 1-14C-glucose. These changes may or may not be detrimental to the animals; an alteration from the normal pattern of glucose catabolism was merely indicated. The main significance was that a biochemical change was detectable at low concentrations of 0.05 and 0.1 mg per kg levels, in vivo. (Pulliam-Vanderbilt)

DETERMINATION OF LEAD IN ATMOSPHERIC PARTICULATES BY FURNACE ATOMIC ABSORPTION,
Varian Instrument Div., Palo Alto, Calif.
J. F. Lech, D. Siemer, and R. Woodriff.
Environmental Science and Technology, Vol 8, No 9, p 840-844, September, 1974. 8 fig, 2 tab, 18 ref. NSF (GP28055).

Descriptors: *Lead, *Air pollution, *Analytical techniques, *Spectroscopy, Toxicity, Filters, Porous media, Trace elements, *Pollutant identification.
Identifiers: Atomic absorption.

The use of furnace atomic absorption along with porous graphite filtration for the determination of atmospheric lead was discussed. Using the Woodriff furnace as the atomization device and cups made of porous graphite, air samples were taken and the cups were inserted into the furnace for determination with no other chemical or physical treatment. The sensitivity of the determination based on a minimum detectable recorder deflection of 1% was 2.5 x 10 to the minus 12th power gram/sample, equivalent to 0.005 microgram/cu m for a 100-cc air sample. When a standard particulate generator was used, the porous graphite compared favorably with Millipore filters. Organic lead however, was not found to be retained by either type of filter. (Jernigan-Vanderbilt)

KINETIC-COULOMETRIC DETERMINATION OF MERCURY IN BIOLOGICAL SAMPLES,
Maryland Univ., College Park. Dept. of Chemistry.
T. J. Rohm, and W. C. Purdy.
Analytica Chimica Acta, Vol 72, No 1, p 177-182, September, 1974. 4 tab, 18 ref.

Descriptors: *Analytical techniques, *Mercury, *Colorimetry, *Heavy metals, *Bioassay, Fish, Water pollution, Testing procedures, *Pollutant identification.

Samples were destroyed in a sealed pressure bottle by strong oxidizing agents. The procedures ensured that no Hg was lost by volatilization. After most of the organic matter in the sample had been destroyed, the Hg was extracted with dithizone in toluene. Chloride and EDTA addition before extraction prevented Ag from being extracted and interfering in the kinetic-coulometric method. The Hg is then back-extracted into 5M hydrochloric acid for assay by the kinetic-coulometric procedure, which is sensitive to 10 ppb Hg. Catalysis of the kinetic reaction was dependent on the Hg activity in the sample, which is influenced by the chloride content of the test solution. In order to avoid errors in the assay procedure, the method of standard additions was employed to compensate for small changes in Hg activity due to changes in chloride concentration. Recoveries of Hg added to samples before analysis ranged from 94.0 to 107.5% of the added Hg. The amounts of Hg found in urine and fish samples analyzed by this method were in agreement with those levels determined by other procedures. (Pulliam-Vanderbilt)

SEPARATION OF COPPER (II) FROM URANIUM (VI) AND MANY OTHER ELEMENTS BY CATION-EXCHANGE CHROMATOGRAPHY IN ACETONE-HYDROBROMIC ACID MEDIA - IMPROVED SELECTIVE SEPARATION OF COPPER,
National Chemical Research Lab., Pretoria (South Africa).
F. W. E. Strelow, A. H. Victor, and C. H. S. W. Weinert.
Analytica Chimica Acta, Vol 69, No 1, p 105-110, March, 1974. 3 fig, 2 tab, 3 ref.

Descriptors: *Separation techniques, *Trace elements, *Cation exchange, *Chromatography, Copper, Uranium radioisotopes, Acids, Magnesium, Nickel, Manganese, Aluminum, *Pollutant identification.

Additional selectivity in a separation by ion-exchange chromatography can be obtained by changing from one eluting system giving a certain selectivity sequence to another system giving a different sequence. The procedure provided an excellent means for the selective separation of copper from all the elements retained together with it after the group forming more stable chloride complexes was eluted with 0.2M hydrochloric acid in 85% acetone. Elution of copper (II) was sharp and quantitative while U(VI), Co(II), Li, Na, Mg(II), Ni(II), Ti(IV), Be and Al were quantitatively retained by the column used. (Jernigan-Vanderbilt)

REMOTE SENSING OF ALGAL BLOOMS BY AIRCRAFT AND SATELLITE IN LAKE ERIE AND UTAH LAKE,
National Environmental Satellite Service, Hillcrest Heights, Md.
A. E. Strong.
Remote Sensing of Environment, Vol 3, No 2, p 99-107, 1974. 7 fig, 8 ref.

Descriptors: *Remote sensing, *Eutrophication, *Circulation, Satellites(Artificial), Aircraft, Lake Erie, Utah, Photography, Wavelengths, Monitoring.
Identifiers: *Utah Lake(Utah), ERTS-1.

As aircraft flights were being made over Lake Erie on October 15, 1972, underflying the Earth Resources Technology Satellite (ERTS-1), a long dark streamer was observed. The phenomena of such algal blooms, characterizing eutrophic conditions, have been noticed on other shallow lakes using ERTS-1. The concentration of the algae into long streamers provides additional information on surface circulations. To augment the ERTS Multispectral Scanner Subsystem (MSS) data of Lake Erie an aircraft was used to obtain correlative thermal-IR and additional multiband photographs. The algal bloom is highly absorptive in the visible wavelengths but reverses contrast with the surrounding water in the near-IR bands. The absorption of shortwave energy heats the dark brown algal mass, providing a hot surface target for the thermal-IR scanner. Bloom of Aphanizomenon flos-aquae observed in Utah Lake together with recent bloom history in Lake Erie is used to verify the Great Lakes bloom. Although most Great Lake algae blooms can be expected to be on a scale barely resolved by the ERTS system, a careful interpretation and some judicious computer processing and image enhancement should reveal many algae bloom situations that would otherwise go unnoticed. (Jones-Wisconsin)

ULTRAVIOLET ABSORPTION/SALINITY CORRELATION AS AN INDEX OF POLLUTION IN INSHORE SEA WATERS,
University Coll. of North Wales, Manai Bridge. Marine Sciences Lab.
P. Foster.
N Z J Mar Freshwater Res 7(4): 369-379, 1973.
Identifiers: *Fiji Islands, Inshore, *Pollution indices, *Salinity, Sea water, Streams, *Ultraviolet absorption, *Pollutant identification.

UV absorption spectra of fresh and marine waters along the southern coast of Viti Levu, Fiji, are recorded. Variations in the magnitude of the absorption from streams devoid of human influence limit the use of such measurements as a sensitive index of organic pollution. However, where there is a significant difference between the absorption magnitudes of adjacent streams, these can be individually identified in coastal waters by concurrent absorption and salinity measurements. Such measurements characterize water masses in inshore waters, and indicate the origin of their freshwater components. Consequently the method has particular relevance in sea areas influenced by fresh waters with enhanced UV absorbance due to organic pollution.--Copyright 1974, Biological Abstracts, Inc.

CHEMICAL ANALYSES FOR WATER QUALITY - TRAINING MANUAL.
Environmental Protection Agency, Cincinnati, Ohio. Water Quality Office.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-224 212, $10.25 in paper copy, $2.25 in microfiche. Report No EPA-430/1-73-003, February 1973. 398 p, 184 ref.

Descriptors: *Analytical techniques, *Chemical analysis, *Water quality, *Training, Ammonia, Biochemical oxygen demand, Carbon, Chemical oxygen demand, Chlorine, Dissolved oxygen, Hardness(Water), Iron, Flame photometry, Manganese, Nitrates, Spectrophotometry, Nitrites, Legal aspects, Laboratory tests, Pesticides, Phenols, Phosphorus, Conductivity, Surfactants, Trace elements, Spectroscopy, Chromatography, Infrared radiation, Remote sensing, Data collections, *Pollutant identification.
Identifiers: *Training manuals, Atomic absorption spectrophotometry, EPA-NTC Course 100.

This manual is a supplement to the training program which provides specialized instruction in the field of water pollution control enabling application of new research findings through updating of skills of technical and professional personnel, and to train new employees recruited from other professional or technical areas in the special skills required. It provides an overview of the nature, causes, prevention, and control of water pollution. Better management of the water resource and more engineering research are urgently needed. The statistical methods deal with the presentation and analysis of numerical data from samples. Methods deal with analytical reactions (standard solutions), acidity, alkalinity, pH, and buffers. Relative to dissolved oxygen determination, factors affecting DO concentration in water and the analytical method background are given. Many determinations for nutrients, nitrogen, carbon are presented, among them: sources and analysis of organic nitrogen, laboratory procedure for total hardness, determination of phosphorus in the aqueous environment. Principles of emission spectroscopy, flame photometry, principles of absorption spectroscopy, and atomic absorption spectrophotometry, other instrumentations, and organic analyses with laboratory procedures are included. Legal procedures in which water quality evidence may be used, followed by case preparation and courtroom procedure are detailed. (Jones-Wisconsin)

ON THE LEAD CONTENT OF HUMAN HAIR (1871-1971),
Washington Univ., St. Louis, Mo. Center for the Biology of Natural Systems.
W. Lockeretz.
Science, Vol 180, p 1080, 1973. 8 ref.

Descriptors: *Lead, *Testing procedures, *Temporal distribution, Analytical techniques, Human physiology, *Pollutant identification.
Identifiers: *Human hair.

A recent report showed that the lead content of human hair was much lower in 1971 than between 1871 and 1923 (Weiss, et al, Science Vol 178, p 69, 1972). The assumption made by Weiss that this finding demonstrates that overall intake of lead has decreased despite an increase in atmospheric lead levels is disputed. Because the study showed the 1871-1923 children's hair samples to contain 164 ppm and adults' samples to contain 93 ppm of lead (both much greater than levels of workers with overt lead intoxication), the lead content of these antique hair specimens is not a valid indicator of lead intake. The reason for the discrepancy seems to be that Weiss, et al, did not distinguish between lead incorporated into the growing hair (endogenous) and lead subsequently acquired from external sources (exogenous). (Jernigan-Vanderbilt)

GRAVIMETRIC ESTIMATION OF SILVER AS DIAMMINESILVER (I) TETRAISOTHIOCYANATODIANILINECHROMATE (III),
Lucknow Univ. (India). Dept. of Chemistry.
S. K. Bhargava, P. K. Mathur, and R. Gopal.
Current Science, Vol 43, No 13, p 408-409, July 5, 1974. 2 ref.

Descriptors: *Analytical techniques, *Silver, *Metals, Gravimetric analysis, Estimating, Bromine, Chlorine, *Pollutant identification.

Silver(I) can be estimated by tetraisothiocyanatodianilinechromate(III) anion in presence of Cl- and small amount of Br- ions as diamminesilver(I)-tetraisothiocyanatodianilinechromate(III). Freshly prepared alcoholic solution of (aniline) H (Cr(NCS)4 (aniline)2) with Ag (NH3)2 Cl solution gave a rose precipitate, (Ag(NH3)2) (Cr(NCS)4(aniline)2) which was insoluble in water and common organic solvents and was easy to wash. The high molecular weight (m.w. = 612) of the precipitated compound rendered it possible to estimate silver (I) in minute quantities. The ratio of silver and the precipitated compound was 1:5.67. A number of experiments involving solutions containing varying amounts of silver and several metal ions confirmed the reliability of the method. (Pulliam-Vanderbilt)

METHOD FOR DETERMINATION OF SELENIUM, ARSENIC, ZINC, CADMIUM, AND MERCURY IN ENVIRONMENTAL MATRICES BY NEUTRON ACTIVATION ANALYSIS,
National Bureau of Standards, Washington, D.C. Activation Analysis Section.
E. Orvini, T. E. Gills, and P. D. LaFleur.
Analytical Chemistry, Vol 46, No 9, p 1294-1297, August 1974. 6 tab, 6 ref.

Descriptors: *Heavy metals, *Analytical techniques, *Radioisotopes, *Neutron activation analysis, Selenium, Zinc, Cadmium, Mercury, Standards, Testing procedures, Separation techniques, Trace elements, *Pollutant identification, Chemical analysis.

The problem of selecting a suitable matrix for the determination of As, Se, Zn, Cd, and Hg by neutron activation analysis was discussed. The most sensitive and useful (n, gamma) reactions involve short half-lived isotopes of As, Zn, Cd, and Hg, thus requiring chemical separation of these elements from the activated matrix. Most separation methods reported involved dissolution of the matrix, often requiring different methodology for each different matrix. A combustion technique was modified and extended to separate quantitatively As, Zn, Cd, Hg and Se from different biological materials and materials of environmental interest. The quantitative recovery of Se, As, Zn, Cd and Hg through the proposed separation procedure was checked initially using long lived isotopes of these elements added to non-irridiated matrices. The activity recovered was compared with the activity of a like quantity of tracer counted in the same standard geometry. After those preliminary tests, the method was checked by analyzing some previously certified standard reference materials, for which the concentrations of the elements determined covered a wide range. (Jernigan-Vanderbilt)

DETERMINATION OF MERCURY IN FLUORSPAR MINING SURVEY SAMPLES,
British Steel Corp., Sheffield (England).
J. Davey, and M. M. Nicholson.

Available from the National Technical Information Service, Springfield, Va 22161, as PB-225 716, $3.25 in paper copy, $2.25 in microfiche. October 1973. 5 p, 3 fig, 3 tab, append.

Descriptors: *Mercury, *Mining, *Analytical techniques, *Rocks, *Spectroscopy, Pollutants, Industrial wastes, Mining industry, Exploration, *Pollutant identification, Surveys.
Identifiers: *Fluorspar, Fluorite, Absorption spectra.

The development of a method for the determination of mercury at the trace level in fluorspar mining survey samples was described. The method utilized a cold vapor atomic absorption technique. The effect of possible interfering elements was examined; results obtained when applied to typical samples were described. The method developed provided a simple, quick and reliable way of determining trace level amounts of mercury in siliceous, shale and calcareous materials. No serious interferences were detected. Because of the level of contents being determined, high purity reagents were used and blank values were determined. A limit of detection of 0.03 microgram Hg was possible for a 10cm pathlength gas cell. (Jernigan-Vanderbilt)
W75-03794

DETERMINATION OF THE COMPOSITION AND THE STABILITY CONSTANTS OF COMPLEXES OF MERCURY (II) WITH AMINO ACIDS,
Amsterdam Univ. (Netherlands). Lab. for Analytical Chemistry.
W. E. Van Der Linden, and C. Beers.
Analytica Chimica Acta, Vol 68, No 1, p 143-154, January, 1973. 5 fig, 1 tab, 9 ref.

Descriptors: *Mercury, *Amino acids, Chemistry, Organic compounds, Ions, Stability, Hydrogen ion concentration, Metals, *Pollutant identification, *Chemical analysis.
Identifiers: *Complexes(Mercury), Mercury compounds.

The complex formation of mercury (II) with twenty of the most important amino acids was investigated, and the corresponding stability constants were reported. Calculations were based on simultaneous pH and pM measurements of solutions containing the amino acid in excess with respect to mercury. It was shown that most amino acids form mononuclear monoligand complexes as well as mononuclear biligand complexes. A different behavior was observed for histidine and methionine, for which the complexes become strongly protonated at lower pH values. (Jernigan-Vanderbilt)
W75-03798

BACTERIOPHAGES AS VIRAL POLLUTION INDICATORS,
Technion - Israel Inst. of Tech., Haifa. Environmental Engineering Lab.
Y. Kott, N. Roze, S. Sperber, and N. Betzer.
Water Research, Vol 8, p 165-171, March, 1974. 7 tab, 10 ref.

Descriptors: *Analytical techniques, *Bioindicators, *E coli, *Enteric bacteria, *Bacteriophage, *Viruses, Water pollution sources, Coliforms, Pollutant identification.
Identifiers: Coliphages.

The use of bacteriophages as viral pollution indicators was investigated. f2 Phage, attenuated Polio I (LSC) strain introduced daily to a 350 liter experimental oxidation pond showed no decrease in bacterial viruses 2 or other coliphages or Polio I strain. Ratios of coliphages to human enteric viruses ranged in flood waters from concentrations as low as 1:1 to as high as 10,000:1; in wastewater at various seasons the ratio was 1,000,000:1; in trickling filter effluents in winter 100,000:1; in spring 1,000,000:1, in summer and fall 100,000:1; in oxidation pond effluents in winter 10,000:1, in spring 100,000:1, and in summer and fall 10,000:1. In three epidemics in small communities caused by failure of water supply, coliphages were found. At the same time only two samples were postivie human enteric viruses (the third was contaminated with yeasts). Chlorination experiments using the experimental oxidation pond showed that f2 was most resistant. MS2 was very resistant, and coliphages were more resistant than attenuated Polio I virus. Experiments with the oxidation pond effluents showed that coliphages were at least as or even more resistant to chlorine than human enteric viruses. For the purposes of routine microbiological examinations the use of E. Coli B bacteriophages provides an adequate measure of the viral quality of water. (Murphy-FIRL)

EVALUATION OF TOLERANCE LIMITS OF SOME TOXIC SUBSTANCES IN INDUSTRIAL WASTE WATERS BY THE ICHTHYO TOXICITY TEST, (IN ITALIAN),
Camerino Univ. (Italy). Istituto di Igiene.
M. Guerra, and N. Comodo.
Boll Soc Ital Biol Sper 48(22): 989-901, 1972(1973).
Identifiers: Alburnus-albidus, Alkyl benzenesulfonate, Ammonia, Carassius-auratus, Chlorides, Chromates, DDT, *Industrial wastes, Mercury, Phenols, Potassium, Salmo-irideus, Toxic wastes, *Toxicity, Waste waters, *Lethal limit, *Pollutant identification.

The icthyotoxicity test was evaluated for its usefulness in assessing the permissible limit of single toxic substances in liquid industrial waste. Toxic substances frequently present in ground water, i.e. mercury chloride, potassium bichromate, ammonia, phenol ABS (alkyl benzene sulfonate) and DDT, were tested on 3 species of fish (Carassius auratus, Alburnus albidus and Salmo irideus) of different sensitivity to industrial poisons. S. irideus was the most sensitive. The effect of the poisons on the fish was evaluated by mortality rates after 48 h exposure to the pollutants. This method is not suitable for the evaluation of the presence of quantities of toxic substances in liquid waste larger than the maximal permissible quantities. The method is not sensitive enough in the case of individual toxic substances, but it is of value in the case of mixtures of toxic substances present in industrial effluents.--Copyright 1974, Biological Abstracts, Inc.

HEAVY METAL CONTENTS IN TAIWAN'S CULTURED FISH,
Academia Sinica, Taipei (Taiwan). Inst. of Zoology.
S. S. Jeng, and Y-W. Huang.
Bull Inst Zool Acad Sin (Taipei), Vol 12, No 2, p 79-85, 1973.
Identifiers: Cadmium, Carp, Copper, *Cultured fish, Food, Grass carp, *Heavy metals, Lead, Mercury, Milkfish, Nickel, Oysters, Silver carp, *Taiwan, Tilapia, Zinc, *Pollutant identification.

In order to find out whether fish around the waters of Taiwan are safe as to heavy metal contents, 119 fish of Tilapia, common carp, grass carp, silver carp and milkfish, and 240 oysters from the fish pond were analyzed for concentrations of Cd, Cu, Pb, Hg, Ni and Zn. Most of the fish surveyed have a concentration of Hg less than 0.08 ppm and none of them over 0.2 ppm. The Pb level of fish muscle is 0.1 ppm, and 0.5 ppm for oyster. The Cd in fish muscle and oyster is 0.02 ppm and 0.2 ppm, respectively. The contents of Cu, Zn, and Ni studied are at ordinary levels. The heavy metal concentrations of Taiwan's cultured fish do not appear to constitute a hazard for consumers.--Copyright 1974, Biological Abstracts, Inc.

5B. Sources Of Pollution

SOURCES OF PHOSPHORUS INPUTS FROM THE ATMOSPHERE AND THEIR SIGNIFICANCE TO OLIGOTROPHIC LAKES,
De Paul Univ., Chicago, Ill. Dept. of Chemistry.
T. J. Murphy.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 625, $4.25 in paper copy, $2.25 in microfiche. Research Report No 92, 1974. 45 p, 10 tab, 35 ref. OWRT A-065-ILL(2). 14-31-0001-4013.

Descriptors: *Phosphorus, *Precipitation(Atmospheric), *Lake Michigan, Nutrients, Smoke, *Air pollution, Eutrophication, *Illinois, Water pollution sources, *Path of pollutants, Lakes, Pollutant identification.
Identifiers: Particulate matter, Oligotrophic lakes, *Chicago(Ill), Orthophosphates.

Precipitation in the Chicago area was analysed and found to contain .034 mg/l of phosphorus with about one half of this present as ortho phosphate. Because of the small amounts of phosphorus needed to stimulate the growth of organisms in bodies of water which are phosphorus limited, these inputs from the atmosphere are important to many natural bodies of water. From one-fifth to one-third of the phosphorus going into Lake Michigan is from precipitation. The sources of this phosphorus were investigated; almost all sources were found to be of particulate matter. With the exception of emissions from the fertilizer industry these were found to contain a relatively consistent 0.1 percent phosphorus. Since the discharge of particulates to the atmosphere is being controlled, contributions of phosphorus to bodies of water from the atmosphere would also be controlled.

POLLUTIONAL ASPECTS AND CROP YIELDS RESULTING FROM HIGH MANURE APPLICATIONS ON SOIL,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
O. E. Cross.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 562, $3.25 in paper copy, $2.25 in microfiche. Technical Paper 74-4059 presented at the 1974 Annual Meeting of the American Society of Agricultural Engineers, Oklahoma State Univ., Stillwater, June 23-26, 1974. 29 p, 21 fig, 1 tab, 13 ref. OWRT B-012-NEB(3). 14-31-0001-3610.

Descriptors: Water quality control, *Water pollution sources, Nitrogen, Sodium, Potassium, *Farm wastes, *Crop production, *Rates of application, Application methods, Crop response, *Agricultural runoff, Potable water.
Identifiers: Nitrate nitrogen.

Beef feedlot manure has been applied to cultivated and irrigated crop land for four years. Research variables were: four rates of manure application, three depths of plowing and three plant populations. Results reported are relative to the pollutional aspects of the surface runoff water and the underground aquifer as well as crop response. Nitrate nitrogen displacement in the runoff water exceeded the potable water allowable of 10 ppm only during the first 90 minutes of the first irrigation on the heavily manured plots. The concentration of sodium in the runoff, even under the most

adverse conditions, did not exceed the maximum allowable for potable water--1,000 ppm. Potable water quality relative to potassium has been set at a maximum of 10 ppm. The highest potassium concentration runoff was 120 ppm. However, this runoff is acceptable as reuse irrigation water. Relative to crop yield, only the manure treatment indicated a statistically significant increase. Over the 4-year period, crop yield, in general, has not decreased. Plant population and plow depth had no significant effect on yield. The underground water, after 4 years and 9 months of testing, has retained its potable quality.

WATER QUALITY MODELS FOR URBAN AND SUBURBAN AREAS.
Nebraska Univ., Lincoln.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 622, $5.25 in paper copy, $2.25 in microfiche. Completion Report, August 1, 1974. 108 p, 2 fig, 1 tab, 3 ref, 3 append. OWRT A-025-NEB(2).

Descriptors: *Water quality, *Urban runoff, Runoff, *Model studies, Cities, Suburban areas, *Storm runoff, *Simulation analysis, *Hydrograph analysis, Computer models, Water pollution sources.

Urban storm runoff was sampled and analyzed for various pollutional parameters. Data obtained were used in the development of modeling techniques for simulating the quantity and quality of runoff. A hydrograph simulation model developed by the Department of Computer Science at the University of Nebraska was used to generate flow hydrographs comparable to observed runoff data. Modeling techniques similar to those used in the EPA Storm Water Management Model were used for modeling COD, BOD and solids. Data were also obtained relative to concentrations of nitrogen, phosphorus, pesticides and bacteria in the runoff. Data generally confirmed the 'flush effect' of pollutants at the start of the runoff period. These data also showed that urban storm water may contain significant amounts of pollutants. W75-03311

MOBILITY AND DEACTIVATION OF HERBICIDES IN SOIL-WATER SYSTEMS,
Nebraska Univ., Lincoln. Water Resources Research Inst.
T. L. Lavy.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 632, $3.75 in paper copy, $2.25 in microfiche. Completion Report, June 1974. 30 p, 11 tab, 13 ref. OWRT A-024-NEB(1).

Descriptors: Water quality, *Herbicides, *Degradation(Decomposition), Adsorption, *Mobility, Resins, Soil water, *Nebraska, Soil profiles, *Path of pollutants, Aqueous solutions, 2-4-D, Bioassay, Soil analysis, Colloids.
Identifiers: Charcoal, Exchange resins, Atrazine, Butylate, Column leaching studies, Alachlor, Picloram.

The objectives were: (1) to investigate methods which could be used to deactivate or remove herbicides present in aqueous systems; and (2) to measure the mobility of four herbicides (alachlor, atrazine, butylate and picloram) in three Nebraska soil profiles. Charcoal and exchange resins were effective in removing as much as 99% of the 1.2 ppmw herbicide present in an aqueous solution. In a degradation study, the presence of soil colloids and other soil constituents markedly enhanced the breakdown rate of atrazine, alachlor and 2,4-D in a 24-week storage study. A cucumber bioassay was used to detect herbicides remaining in the solution while a soil bioassay using soybeans and millet was effective in monitoring for herbicides in the soil. Studies to determine if degradation of herbicides occurs in samples of groundwater incubated at 10 and 25C for periods up to 15 months showed picloram was more stable than atrazine or alachlor. Considerably less degradation occurred at the lower temperature (which is comparable to field conditions). A field leaching study showed that mobility becomes more rapid as the herbicide moves farther from the surface. Picloram was more mobile than atrazine or butylate under irrigated sandy soils.
W75-03314

INFLUENCE OF FERTILIZER PRACTICES ON WATER AND THE QUALITY OF THE ENVIRONMENT (PHASE II),
Nebraska Univ., Lincoln. Water Resources Research Inst.
R. A. Olson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 624, $4.75 in paper copy, $2.25 in microfiche. Completion Report, June 15, 1974. 82 p, 30 fig, 15 tab, 21 ref. OWRT B-022-NEB(3). 14-31-0001-3908.

Descriptors: *Water quality, Fertilizers, *Groundwater, *Nitrogen, Crop production, Management, *Nebraska, Soil analysis, Path of pollutants, Irrigation practices, Nitrates, Loess, Sands.
Identifiers: Nitrate-nitrogen.

Comparison of deep soil cores taken under various crop management systems with adjacent native pasture indicates that generally fertilizer is contributing only minimal amounts of nitrogen to the groundwater (with non-irrigated agriculture) in Nebraska. Under irrigated conditions, nitrogen is leaching to the water table with the greatest amount occurring on sandy soils with shallow water table. An additional threat to the groundwater exists in southwestern Nebraska where the deep loess soils on the table lands are being put under irrigation and the loess beneath contains several tons of NO3-N per acre of natural or 'geologic' origin. Average nitrate-nitrogen in the groundwater of Nebraska has increased 25 percent during the past decade. Rapid increases with present high levels are found in several areas with intensive irrigation of sandy soils. Nutrients in Nebraska's surface water are primarily of natural origin or from industrial and sewage wastes of cities. Nutrients tend to accumulate in reservoirs with subsequent deterioration of the reservoir and improvement of the emergent stream. The results indicate a need for improved fertilizer and water efficiency under irrigated conditions and further investigation into the environmental hazards associated with extensive irrigation development on the table lands of high subsurface nitrate.

MERCURY LEVELS IN FISHES FROM SOME MISSOURI LAKES WITH AND WITHOUT KNOWN MERCURY POLLUTION,
Missouri Univ., Columbia. Environmental Trace Substance Center.
S. R. Koirtyohann, R. Meers, and L. K. Graham.
Environmental Research, Vol 8, No 1, p 1-11, August 1974. 4 fig, 5 tab, 20 ref. OWRT A-054-MO(2). 14-31-0001-3525.

Descriptors: *Mercury, Fish, *Missouri, Lakes, Pollution, *Fungicides, *Path of pollutant, *Bass, Bioindicators, Water pollution sources.
Identifiers: *Golf greens drainage, Mercury compounds.

Mercurial fungicides used in golf greens maintenance can lead to elevated levels of mercury in fish, from lakes receiving greens drainage. Of the species tested, the largemouth bass was the most sensitive indicator with levels ranging from 1 to 7 g Hg/g of wet tissue in fish taken from lakes which receive drainage from treated greens. Background mercury levels in largemouth bass from impoundments in central Missouri are 0.1 - 1.2 ppm depending on size and other factors. Many lakes with no known source of mercury contamination produce bass which contain significantly more than 0.5 ppm of mercury.

STUDY OF THE HYDROGRAPHIC AND CHEMICAL CONDITIONS IN THE WATER OF THE LAGOON OF TACARIGUA, (IN SPANISH),
Universidad de Oriente, Cumana (Venezuela). Inst. of Oceanography.
B. R. Gamboa-G., A. J. Garcia, J. Benitez-A., and T. Okuda.
Bol Inst Oceanogr Univ Oriente Cumana, Vol 10, No 2, p 55-72, 1971. English summary.
Identifiers: *Chemical studies, *Hydrographic studies, Influx, Inversion, Lagoons, Nitrogen, Organic matter, Oxygen, River, Seasonal, Temperature, Venezuela(Tacarigua Lagoon), Water pollution sources.

Hydrographical and chemical observations were carried out in Tacarigua Lagoon, Venezuela, from April, 1967-Dec., 1969. Due to the shallow water depth (1.0-1.38 m in average), the temperature variation and distribution were affected as much by seasonal change (dry and rainy season) as by daily changes. Vertical inversions of temperature were occasionally noted on the western part (A--zone) and the central area (C--zone). Local and seasonal salinity variations were influenced by river-influx and sea-water penetration, especially on the western side (A and B zones). Salinity variations in the mideastern area were less noted. In general, the O2 content showed little monthly and yearly change in the mid-western area. Phosphate, silicates, nitrates and nitrites showed pronounced monthly and yearly fluctuations. They showed highest values in the western area. Conversely, the high values of ammonia and organic N were observed in the eastern area and the lowest values on the western side.--Copyright 1974, Biological Abstracts, Inc.

CHEMISTRY OF SOME SEDGELAND WATERS: LAKE PEDDER, SOUTH-WEST TASMANIA,
Tasmania Univ., Hobart (Australia). Dept. of Botany.
R. T. Buckney, and P. A. Tyler.
Aust J Mar Freshwater Res Vol 24, No 3, p 267-273, 1973.
Identifiers: *Australia, Biotic communities, *Chemistry, Lakes, Peat, Rainfall, Salinity, *Sedgeland waters, *Tasmania(Lake Pedder), Hydrogen ion concentration.

Surface waters of the Lake Pedder (Tasmania, Australia) area are characterized by low salinity, low pH, high color and a relative major-ion composition near that of seawater. Factors determining this composition are predominance of inert rocks, a covering of sedgeland peat isolating waters from rock contact and a high rainfall brought by prevailing oceanic winds. Frequency and intensity of rainfall appear to determine the pattern of chemical variation. Salinity, bicarbonate and pH may change rapidly during periods of high rainfall. Humic acids are important chemical constituents of the waters and probably determine the type of biotic community which inhabits them.--Copyright 1974, Biological Abstracts, Inc.

EXPERIMENTAL SUPPORT STUDIES FOR THE PERCOL AND TRANSPORT MODELS,
Battelle Pacific Northwest Labs., Richland, Wash. Water and Land Resources Dept.
R. C. Routson, and R. J. Serne.
Available from NTIS, Springfield, Va 22161, as Rept No BNWL-1719; $5.45/copy, $2.25/microfiche. Report No BNWL-1719, 1972. 76 p, 7 fig, 24 tab, 20 ref, 2 append. AEC AT(45-1)-2130.

Descriptors: Water pollution, *Soil contamination, *Radioactivity, *Path of pollutants, *Model studies, *Transport, Movement, Flow, Hydrologic models, Absorption, Ion exchange, Calcium, Sodium, Hydrogen ion concentration, Percolation, Filtration, Centrifugation, Transmissibility, Groundwater.

A group of support studies conducted during development of a transport model for the Radionuclides in Soils Program is described. Measurement studies for sorption parameters concluded that: (1) small calcium experiments are more useful than batch experiments for measuring the Kd of trace solutes which are sorbed by ion-exchange, unless the batch system is prewashed several times with influent prior to measuring the Kd; (2) the decrease in Kd often reported with an increasing soil-to-solution ratio is the result of the reaction of the soil solid phase with the influent solution; (3) batch and small column Kds will agree if the equilibrium chemical environment is equivalent; and (4) the number of regression equations required to adequately define sorption in soil column work is a determinable function for each soil. (Houser-ORNL)

CHARACTERIZATION OF ACTINIDE BEARING SOILS: TOP SIXTY CENTIMETERS OF 216-Z-9 ENCLOSED TRENCH,
Battelle Pacific Northwest Labs., Richland, Wash. Water and Land Resources Dept.
L. L. Ames.
Available from NTIS, Springfield, Va 22161, as Rept No BNWL-1812; $5.45/copy, $2.25/microfiche. Report No BNWL-1812, February 1974. 141 p, 3 fig, 25 tab, 7 ref, append. AEC AT(45-1)-2130.

Descriptors: *Waste disposal, *Nuclear wastes, *Soil contamination, *Path of pollutants, Plutonium, Sites, Locating, Soil investigations, Earth materials, Rocks, Minerology, Minerals, Radioactivity, Chemical reactions, Analysis, Evaluation, Safety, *Washington.
Identifiers: Trench disposal, Hanford site(Wash), *Actinides.

Under pre-1965 waste disposal practices at Hanford, certain actinide-bearing solutions were discharged to the soil in covered trench facilities. The soil response to the influx of acidic, actinide-bearing solutions has pertinence to the present and future locations of the actinides. In order to understand present and future soil-actinide relationships, the following tasks were investigated: (1) Identification of the soil minerals and soil rock types; (2) Location of the actinides; (3) Determination of the present actinides form; (4) Characterization of the soil-solution chemical reactions that resulted in the present form and location of the actinides. Results are presented of work on the above tasks through examination of samples from the upper 60 centimeters of the 216-Z-9 covered trench. (Houser-ORNL)
W75-03423

POTENTIAL CONTAINMENT FAILURE MECHANISMS AND THEIR CONSEQUENCES AT A RADIOACTIVE WASTE REPOSITORY IN BEDDED SALT IN NEW MEXICO,
Oak Ridge National Lab., Tenn.
H. C. Claiborne, and F. Gera.
Available from NTIS, Springfield, Va, 22161 as Rept No ORNL-TM-4639; $4.00/copy, $2.25/microfiche. Report No ORNL-TM-4639, October 1974. 89 p, 5 fig, 13 tab, 71 ref, append.

Descriptors: *Radioactive waste disposal, Solids, *Waste treatment, *Waste disposal, Mining, Hazards, Safety, Technology, Nuclear explosions, Faults(Geologic), Earthquakes, Aquifers, Leaching, Leakage, *New Mexico.
Identifiers: *Salt mines, *Waste repository, Meteorites.

Potential containment failure mechanisms are examined and their probabilities and consequences are estimated, when possible, for a hypothetical waste repository located in bedded salt in southeastern New Mexico. The primary conclusion is that a serious breach of containment for such a repository, either by human action or natural events, is only a very remote possibility and falls into the category of least likely occurrences which affect society. A sealed repository 600 m underground would be virtually sabotage proof; even the surface burst of a 50-megaton nuclear weapon could not breach the containment. Accidental drilling of boreholes through the disposal horizon could cause relatively minor local contamination. (Houser-ORNL)
W75-03425

A ONE-DIMENSIONAL NUMERICAL MODEL OF PRECIPITATION SCAVENGING WITH APPLICATION TO RAINOUT OF RADIOACTIVE DEBRIS,
California Univ., Livermore. Lawrence Livermore Lab.
C. R. Molenkamp.
Available NTIS, Springfield, Va, 22161 as Rept No UCRL-51627; $4.00/copy, $2.25/microfiche. Report No UCRL-51627, July 1974. 39 p, 25 fig, 2 tab, 20 ref.

Descriptors: *Model studies, *Climatic data, *Precipitation(Atmospheric), Mathematics, Height, Clouds, Convection, Suspended solids, Radioactivity, Dusts, Water pollution, Drops(Fluids), Evaporation, Suspension, Measurement, *Radioactive wastes.
Identifiers: *Scavenging, *Debris.

A one-dimensional, time-dependent, entrainment model of cumulus convection has been modified to include a calculation of precipitation scavenging. The primary method of scavenging is postulated to be collection of suspended debris in cloud droplets during condensation nucleation and the subsequent inertial capture of these polluted droplets by falling raindrops. Other possible collection mechanisms are neglected, including inertial capture of debris particles by falling raindrops and attachment of debris to droplets or drops because of phoretic, diffusive, or electrical forces. Resuspension of debris because of evaporation of droplets and drops is modeled. Calculations are described for scavenging by a typical cumulus cell. Parameter studies are performed to examine the dependence of debris deposition on the initial height of debris in the atmosphere and on the fraction of debris passing through the condensation nucleation activation zone that serve as condensation nuclei. (Houser-ORNL)
W75-03427

EFFECT OF FLUID CONTENT ON THE MECHANICAL PROPERTIES OF WESTERLY GRANITE,
California Univ., Livermore. Lawrence Livermore Lab.
A. G. Duba, H. C. Heard, and M. L. Santor.
Available from NTIS, Springfield, Va, 22161 as Rept No UCRL-51626; $4.00/copy, $2.25/microfiche. Report No UCRL-51626, July 1974. 23 p, 6 fig, 13 ref.

Descriptors: *Mechanical properties, *Rock properties, *Rock mechanics, Rocks, Crystalline rocks, *Granites, Physical properties, Pressure, Pores, Porosity, Pore water, Porous media, Strength, Stress, Strain, Compressive strength, Confined water, Compressibility.

Jacketed samples of Westerly granite with water concentrations ranging from 0 to 20% total volume were loaded to failure under conditions of uniaxial stress up to 600 MPa confining pressure. Unjacketed samples, exposed directly to the pressure medium, were tested similarly. The volume and viscosity of fluid available to the intergranular porosity in the granite during uniaxial stress loading significantly influenced the compressive strength. Dry and saturated specimens (0.8% water) were loaded to 700 MPa confining pressure under conditions of uniaxial strain. Large differences in loading paths were observed between the saturated and dry granite. The pressure-

volume curves determined to 300 MPa indicate only slightly less compression for the saturated granite (0.8% water) than for the dry material. Under axial load, the saturated material exhibited less volume decrease than the dry. This difference in compression during axial loading is attributed to water distribution in the cracks of the rock. (Houser-ORNL)
W75-03428

A GEOLOGICAL AND SEISMOLOGICAL INVESTIGATION OF THE LAWRENCE LIVERMORE LABORATORY SITE,
California Univ., Livermore. Lawrence Livermore Lab.
L. H. Wight.
Available from NTIS, Springfield, Va, 22161 as Rept No UCRL-51592; $4.00/copy, $2.25/microfiche. Report No UCRL-51592, June 1974. 43 p, 20 fig, 6 tab, 51 ref, append.

Descriptors: Geology, Geologic formations, *Geologic investigations, *Sites, *Faults(Geologic), *Seismology, *Earthquakes, Seismic design, Seismic properties, Seismic studies, Geologic history, Geomorphology, *California, Hazards.
Identifiers: *Tesla fault(Calif), Seismic history, Livermore Valley(Calif), Response spectrum.

In response to an AEC request for Safety Analysis Reports for all critical structures on the Lawrence Livermore Laboratory site, the seismic hazard at LLL was examined. The geology and seismology of the Livermore Valley and surrounding regions are reviewed and all the active faults in the region are identified based on seismic history, geomorphology and geodetic data. After carefully estimating the accelerations that the site would experience from maximum magnitude earthquakes on each active fault, it is concluded that the Tesla fault has the most potential for doing damage at the LLL site. The response spectrum is derived. (Houser-ORNL)

THE DISSOLUTION OF PU-238 IN ENVIRONMENTAL AND BIOLOGICAL SYSTEMS,
Los Alamos Scientific Lab., N. Mex.
J. H. Patterson, G. B. Nelson, and G. M. Matlack.
Available from NTIS, Springfield, Va 22161, as Rept No LA-5624, $4.00 in paper copy, $2.25 in microfiche. Report No LA-5624, July 1974. 6 p, 2 tab, 24 ref.

Descriptors: *Plutonium, *Solubility, Ecosystems, *Chemical properties, *Stable isotopes, Isotope studies, Aqueous solutions, Water, Distillation, Saline water, Chemical reactions, Ions, Physical properties, Radioactivity, *Radioisotopes, Environmental effects.

Results from experiments on dissolution rates of 238PuO(sub 2) and 239PuO(sub 2) in distilled water and normal saline solution were compared with rates calculated from data in the literature on various PuO(sub 2) dissolution experiments. The initial comparatively rapid dissolution rates were found to vary widely, even between experiments performed ostensibly under the same conditions. In contrast, the lower rate of dissolution, which began a few hours after contact of the oxide with the aqueous medium, was constant and fell within a range of 1 to 6 ng/sq m's under widely varying conditions. (Houser-ORNL)

THE DELAWARE ESTUARY SYSTEM, ENVIRONMENTAL IMPACTS AND SOCIO-ECONOMIC EFFECTS. UPPER ESTUARY POLLUTION AND TRANSFER RELATIONSHIPS,
Rutgers - the State Univ., New Brunswick, N.J. Work Group on Upper Estuary Pollution on Transfer Relationships.
H. Baker.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-229 782, $4.25 in paper copy, $2.25 in microfiche. Final report (partial). September 1973. 50 p, 11 tab, 15 fig, 31 ref. GI-33369.

Descriptors: *Estuaries, Water pollution, *Mathematical models, *Pollution abatement, *Water pollution control, Delaware River, Delaware River Basin Commission, *Water quality, Water pollution sources, Delaware, Mathematics, Water supply, Water demand, Water consumption, Water control, Water policy, Water management, *Water quality control, Water utilization, Water supply development, Water resources, Water resources development, Recreation, Water chemistry, Water Quality Act.
Identifiers: *Delaware River Estuary.

Environmental problems and situations are outlined and interim suggestions for remedial action are given. As of July 1973, of the 103 listed dischargers involved in the pollution abatement program, 41 had completed facilities, 12 were in compliance with their schedules, 29 were not meeting their schedules and 21 had yet to submit approvable abatement schedules. Delaware River Basin Commission (DCRB) feels that its 10-year plan to clean up the estuary is proceeding on schedule. Research on the River by DCRB, U.S. Geological Survey and the Philadelphia Water Department is described. Mathematical modeling was employed to prepare a comprehensive program for improvement and maintenance of water quality and to determine relationships between pollution and water quality. Format for initial model was one-dimensional, steady-state, finite-differenced. Improvements on the model resulted in several computer programs briefly described. Areas around the Delaware Estuary are expanding rapidly; most projections show population doubling in 40 years. To supply water for this increase, an assessment of future pollution loads must be available now. Power companies located on the Delaware River must submit a master siting study of any generating plants. Municipal and industrial waste loads must be projected and then managed. Another important factor in pollution abatement is control of rural and urban runoff. At the same time this pollution is occurring, water demand will increase at a similar rate, and as more leisure time is created, there will be greater demand for water for recreation. The future state of the Delaware River depends on how well the future is predicted, plus successful pollution strategy designed to cope with future pollution loads. INVESTIGATIONS ABOUT POPULATION DYNAMICS AND NUTRITIONAL ASPECTS ON THE SIMULID-LARVAE OF A MOUNTAIN STREAM POLLUTED BY ORGANIC WASTE WATER, (IN GERMAN),
Freiburg Univ. (West Germany). Limnologisches Institut.
R. Gloetel.
Arch Hydrobiol Supplementb. Vol 42, No 3/4, p 406-451, 1973. English summary.
Identifiers: Feeding, Filters, Growth rates, *Larvae foods, Mountain, Nutrition, Organic matter, *Population dynamics, *Self purification, Sewage, *Simuliid larvae, Stream, Waste waters, Water pollution sources.

In a stream into which organic matter is introduced, the environmental conditions for the organisms living in it change fundamentally. The effect of this change can be seen on the filter-feeding simuliid larvae, which feed mainly on suspended particulate matter. A short distance below the outlet of the waste water on the number of species of simuliid is reduced. On the other hand a small number of species shows a considerable increase in growth and population. Parallel to the process of self-purification, the number and growth of those species more resistant to change of ecological conditions decrease, whereas the number of the less resistance species increase again. At the end of the polluted stretch, where self-purification is nearly finished, the same species in approximately the same number as above the introduction of the sewage, can be found.--Copyright 1974, Biological Abstracts, Inc.

Biotechnol Bioeng, Vol 15, No 4, p 611-647, 1973.
Identifiers: Environmental studies, Microorganisms, *Molecules(Nonbiodegradable), Pollution, Soils, Toxicology, Water pollution, *Biodegradation, *Synthetic chemicals, *Chemical wastes.

Many natural products show remarkable durability in natural ecosystems, and some of these substances are of practical concern. A variety of synthetic compounds (e.g., pesticides, polychlorinated biphenyls, synthetic polymers, surfactants, nitrogen compounds, industrial wastes) are also persistant in nature, and this resistance is important because of the large amounts of such chemicals now manufactured and their effects in a variety of environments. The degradation of synthetic chemicals results mainly from microbial activity, and attempts to minimize soil and water pollution would be facilitated by adequate information on why many pollutants are so refractory. Fifteen possible mechanisms of recalcitrance in natural systems are discussed. Biodegradability of a compound often can be increased by appropriate structural modifications. Manufacturing costs may be increased, but if society wishes to enjoy the benefits of synthetic chemicals and yet have an environment free of toxic or offensive materials, it must accept the additional cost.--Copyright 1974, Biological Abstracts, Inc.

GROUND-WATER QUALITY STUDY,
Colorado State Univ., Fort Collins.
N. F. White, and D. K. Sunada.
Journal of the Irrigation and Drainage Division, Proceedings of ASCE, Vol 100, No IR3, p 277-292, Septembr, 1974. 6 fig, 4 tab, 9 ref.

Descriptors: *Groundwater, Hydrologic aspects, Basins, Drainage, Aquifers, Data analysis, Evapotranspiration, Irrigation, Dissolved solids, *Colorado, *Water quality, *Water pollution sources.
Identifiers: *Severance Basin(Colo).

Groundwater contamination was studied at Severance Basin in Colorado. Water quality was analyzed for both geologic and hydrologic detail. Increasing contamination in the basin was attributed to leaching of applied fertilizer, drainage from silage pits and feed lots, percolation of contaminants from oil field brine pits, and geologic contamination of the aquifer. Data limitations made it difficult to isolate sources of groundwater contamination. Major causes of contamination in this aquifer were concluded to be a combination of a high rate of evapotranspiration and the relatively low surface and groundwater outflow from the basin. This resulted in total dissolved solids in the basin increasing at the rate of 170 ppm per year. When irrigation was accompanied by high evapotranspiration rates, mechanism of pollution proved to be a major cause of aquifer contamination. (Prague-FIRL)

MIXING AND TRANSPORT, (LITERATURE REVIEW),
Delaware Univ., Newark. Dept. of Civil Engineering.
J. D. Ditmars.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1591-1604, June, 1974. 126 ref.

Descriptors: *Reviews, *Bibliographies, *Mixing, *Transport, Streams, Rivers, Lakes, Reservoirs, Bays, Estuaries, Coastal areas, Dispersion, Open channel flow, Current, Water pollution, Waste water treatment, Jets, Plumes.
Identifiers: Sinuous channel geometry, Longitudinal dispersion, Transverse turbulent diffusion, Dissolved oxygen.

Dispersion and mixing in open-channel flow were reviewed. The theoretical bases for the one-dimensional, cross-sectiolly averaged concentration equation and the longitudinal dispersion coefficient were also investigated. Laboratory and field data were provided for both vertical and transverse turbulent mixing coefficients. The effect of sinuous channel geometry on longitudinal dispersion was explored experimentally along with the relationships between the bulk flow and channel geometry parameters and the longitudinal dispersion coefficient using laboratory and natural stream data. The dispersion coefficient increased with increases in stream radius of curvature and decreased with increases in bend length and mean depth. Solutions were found to the convective-diffusion equation for point and line sources in rivers. Integral transform techniques were used to arrive at the solution, and accounted for the presence of surface, bottom, and bank boundaries, assuming constant values for the longitudinal vertical, and lateral turbulent diffusion coefficient, and for the longitudinal current. (Leibowitz-FIRL)

SOLUTION, DIFFUSION AND SORPTION IN UPPER LAYER OF LAKE SEDIMENTS: III. CHEMICAL AND PHYSICAL CONDITIONS IN SEDIMENT-WATER TRANSITION ZONE OF MEROMICTIC BOG LATE (URSEE) AND ITS RELATION TO ACCUMULATION OF VIVIANITE, (IN GERMAN),
Freiburg Univ. (West Germany). Limnoloaisches Institut.
U. Tessenow.
Arch Hydrobiol Supplementb, Vol 42, No 3/4, p 273-339, 1973. English summary.
Identifiers: Bogs, Chemical studies, Diffusion, Lakes, Meromictic bogs, Migration, Physical studies, Precipitation(Atmospheric), Sediments, Sorption, Vivianite, *Iron, *Phosphates, *West Germany(Lake Ursee), *Lake sediments, Sediment-water transition zones.

The recent accumulation of Fe (Mn) and phosphate in the sediment of Lake Ursee (West Germany) is directly correlated with vertical and horizontal concentration gradients in the permanently anaerobic deep water and in the interstitial water of the sediment. The small sharply limited area of the highest Fe and phosphate contents in the particulate and dissolved phase of the sediment results from the very sharp concentration gradients in the overlying water and from the morphometry of the monilimnion. The formation of vivianite takes place in the deepest region of the lake (10.55-10.60 m), where the highest concentrations of dissolved Fe and phosphate (35-40 and 4.5-5.5 mg/l respectively, pH = 6.3) exist. The conditional solubility product of vivianite there amounts to (Fe2+)3.(PO43-)2 = 2-4.10-32 (mol)5. The accumulation of vivianite is the result of internal migration of Fe and phosphate from the sediments of lake depths down to about 10.5 m to the sediments of the very deepest region of the lake. Processes of solution, transport and precipitation, especially in the boundary-zones of the anaerobic deep water participate in this migration.—Copyright 1974, Biological Abstracts, Inc.

A STUDY OF NITRILOTRIACETIC ACID (NTA) DEGRADATION IN A RECEIVING STREAM,
Department of the Environment, Ottawa (Ontario). Wastewater Technology Centre.
E. E. Shannon, P. J. A. Fowlie, and R. J. Rush.
Environmental Protection Service, Technology Development Report EPS 4-WP-74-7, August 1974. 34 p, 9 fig, 3 tab, 15 ref.

Descriptors: *Nitrilotriacetic acid, *Biodegradation, Natural streams, *Water pollution sources, Detergents, *Canada, Kinetics, Water properties, Water analysis, Water temperature, Water pollution, Temperature, Seasonal, Monitoring, Tracers, Fluorometry, Harbors, *Path of pollutants.
Identifiers: Grindstone Creek(Ontario), Hamilton Harbor(Ontario).

Nitrilotriacetic acid (NTA) levels in Grindstone Creek (the receiving water for the Waterdown, Ontario, waste water treatment plant) were monitored to determine the degree of NTA degradation under summer and winter extremes of water temperature. Sampling stations were established at 6 points over the 5 mile stretch of stream between Waterdown and Hamilton Harbor. Samples were collected under two influent waste water NTA loading conditions (16-20 mg/liter and 8-16 mg/liter) during summer and winter. Stream flow and temperature were closely monitored. Fluorometric tracer studies were integrated with the monitoring program. During the summer period when NTA removal through the treatment plant was in excess of 95%, dilution and degradation combined to given downstream NTA concentrations consistently less than 10 micrograms/liter. In the winter when stream temperatures were 0.5-3.0 C and NTA removal through the plant was less than 45%, downstream NTA concentrations as high as 125 micrograms/liter were encountered. At the same time, levels at the mouth of Grindstone Creek in Hamilton Harbor averaged 40-50 micrograms/liter. There was evidence of in-stream biodegradation at low water temperatures (this was confirmed by laboratory studies). First-order degradation rate coefficients were determined from the laboratory data. (Witt-IPC)

Wochenblatt fuer Papierfabrikation, Vol 102, No 7, p 243-245, 248, 250, April 13, 1974. 4 fig, 5 tab, 4 ref.

Descriptors: *Water pollution sources, *Water pollution effects, *Water quality, Waste water(Pollution), *Pulp wastes, Europe, *Pulp and paper industry, Discharge(Water), Effluents, *Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Hydrogen ion concentration, Water properties, Temperature, Water temperature, Streams.
Identifiers: *Yugoslavia, Coated papers, Groundwood pulp, Paper machines, White water.

An integrated Yugoslavian pulp and paper mill which operates a groundwood plant, four paper machines, and an off-machine paper-coating plant is described. The mill discharges its effluent into a stream. The effects of these discharges have been studied for a year. Water quality variations (stream temperature, suspended solids, pH, COD, and BOD) have been sampled at three points below the mill outfall and compared with stream parameters above the outfall. The discharge was shown to have noticeable effects on stream quality as far as 2.5 km downstream. (Speckhard-IPC)

KINETICS OF MERCURY ADSORPTION AND DESORPTION IN SEDIMENTS,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
R. S. Reimers, and P. A. Krenkel.
Journal Water Pollution Control Federation, Vol 46, No 2, p 352-365, February, 1974. 17 fig, 3 tab, 20 ref.

Descriptors: *Mercury, *Adsorption, *Sediments, Soil types, Sands, Inorganic compounds, Sediment transport, Hydrogen ion concentration, Chlorides, *Path of pollutants.

The sorption characteristics of clays, sands and sediment organics with varying pH values, chloride concentrations and mercury species and compounds, including differing mercury concentration were observed, and the potential for inhibition of mercury methylation in the sediments was determined. At a constant pH value, the adsorption of inorganic mercury was definitely affected by increased chloride concentration with a 20 to 100 percent loss in capacity, depending on the constituents of the sediment. Because inorganic mercury binds with sands, clays, and various organics, the contention that mercury pollution is transported in water system by sediments was supported. (Jernigan-Vanderbilt)

DIFFUSION OF IONS IN SEA WATER AND IN DEEP-SEA SEDIMENTS,
Eidgenossische Technische Hochschule, Zurich (Switzerland).
Y-H, Li, and S. Gregory.
Geochimica et Cosmochimica Acta, Vol 38, No 5, p 703-714, May 1974. 5 fig, 1 tab, 28 ref.

Descriptors: *Sea water, *Sediments, *Diffusion, *Ions, *Mathematical studies, Anions, Cations, Tracers, Radioisotopes, *Path of pollutants.

The tracer-diffusion coefficients of a given ion in water Dj degrees and in sea water Dj* differ no more than 0-8 per cent, so for the first approximation, Dj degrees values can be safely used as Dj* in sea water. The temperature and pressure dependence of Dj and viscosity, n, of solution are closely related. Since pressure effect on n is small, one can assume the same for Dj. Under the restriction of electro-neutrality, the average diffusion coefficient a Dj* of major cations are greater but of major anion, smaller than their respective Dj* and Dj. But for ions with very low concentration, a Dj* = Dj*. The tracer diffusion coefficient of ions in deep-sea sediment, Dj. sed. and in sea water Dj*, are related by the simple equation: Dj.sed. = Dj* alpha/theta squared. The factor alpha/theta squared of sediment can be determined easily by measuring the tracer diffusion coefficient of Cl- or SO42- in the sediment with the technique described. (Pulliam-Vanderbilt)

RARE EARTH ELEMENTS IN FERROMANGANESE NODULES AND OTHER MARINE PHASES,
Washington Univ., Seattle. Dept. of Oceanography.
D. Z. Piper.
Geochimica et Cosmochimica Acta, Vol 38, No 7, p 1007-1022, July, 1974. 8 fig, 2 tab, 41 ref.

Descriptors: *Trace elements, *Marine geology, *Path of pollutants, *Neutron activation analysis, Distribution patterns, Metals, Sediments, Oceans, Seawater, Shales, Transfer, Pacific Ocean, Iron, *Pollutant identification.
Identifiers: Rare earth elements.

The concentrations of rare-earth elements (REE) have been measured in 31 ferromanganese nodules from the Pacific and Indian Oceans and vary by almost a factor of 5. Too few nodules have been analyzed to define possible regional trends. The shale-normalized patterns, however, permit division of nodules into two groups: those from depth greater than 3000-3500 m and those from less depth. The factors that determine this change in the relative concentration of REE may be related to the mineralogy of manganese phases and/or the transport of REE to the deep ocean by particulate matter. Comparison of the REE patterns of nodules with those of phillipsite, phosphorite, clays, CaC03 and seawater suggests that the patterns of these phases reflect fractionation from an initial pattern closely resembling that of shale. By assuming that the accumulation rate of REE in clays, CaCO3 and nodules is represented by that for surface sediments, it has been possible to estimate an accumulation rate of phillipsite in pelagic sediments of the Pacific of 0.02 mg/sq cm/yr. ON THE SPRING MAXIMUM OF THE CONCENTRATION OF TRACE CONSTITUENTS IN ATMOSPHERIC PRECIPITATION,
Institute for Atmospheric Physics, Budapest (Hungary).
E. Meszaros.
Tellus, Vol 26, No 3, p 402-407, 1974. 3 fig, 6 ref, append.

Descriptors: *Trace elements, *Precipitation(Atmospheric), *Troposphere, Gases, Calcium, Data collection, Sampling, Ions, Chlorides, Oxidation, Laboratory tests, Europe, *Air pollution.
Identifiers: *Hungary.

A possible reaction between ozone and other trace gases was postulated on the basis of the annual variations of the concentration of different soluble components in precipitation waters collected in Hungary and in different parts of Europe. For five years, four stations installed in a rural area in Hungary collected monthly precipitation samples. Dry fallout was also included in the samples. From the samples, the pH and electrical conductivity of the water as well as the concentrations of sulfate, nitrate, ammonium, calcium and chloride ions were determined. On the basis of observations from the samples and laboratory experiments, it was concluded that stratospheric ozone plays an important part in the chemistry of tropospheric trace constituents and more exactly in the oxidation and removal of sulfur and nitrogen dioxide. Identifiers: *Repro-modeling, Photochemical air pollution, Carbon monoxide, Nitric oxide, Nitrogen dioxide, *Los Angeles basin(Calif), Reactive hydrocarbons, Unreactive hydrocarbons.

Several physical models which simulate the impact of emissions and meteorology on the creation and dispersion of photochemical smog have been developed. Characteristics of most of these models are that they are highly computational and require a great deal of input data; hence, it is generally difficult to systematically explore the implications of the models or to use them in a planning context where many model runs are required. 'Repro-modeling' and the analysis and replication of the input/output characteristics of the model were explored as a means of meeting these objectives. A study of the applications of repro-modeling to the Systems Applications, Inc. (SAI) model developed for the Los Angeles Basin was described. The major objectives were: (1) a feasibility test of the repro-modeling approach; (2) a limited interpretation of the implications of the model; and (3) an efficient repro-model program which duplicates input/output relationships of the original model. The repro-model developed was analyzed in a particular application context (i.e., transportation emission control policy evaluation) and its general implications were discussed. Examples of use of the repro-model, which requires orders of magnitude less computer time than the original model, were provided. An appendix contains a Fortran listing of the repro-model program. GROUND-WATER QUALITY MODELING,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Hydrology.
L. W. Gelhar, and J. L. Wilson.
Ground Water, Vol 12, No 6, p 399-408, November-December 1974. 6 fig, 3 tab, 22 ref.

Descriptors: *Water quality, *Groundwater, *Water pollution sources, *Model studies, *Parametric hydrology, Water-table aquifers, Land management, Inflow, Discharge(Water), Storage, *Massachusetts, Highway icing, Deicers, Septic tanks, Nitrates, Recharge, Water balance, Water table, Dupuit-Forchheimer theory, Numerical analysis, Salts.
Identifiers: Lumped-parameter models, *Linear reservoirs, Phreatic aquifers.

A generalized lumped parameter groundwater model was developed based on simultaneous water and solute balances for a phreatic aquifer. The basis for the lumped parameter approach was established by comparison with theoretical analyses of water and solute dynamics in a distributed aquifer model. The basic behavior of the model is characterized by two response times, one associated with the hydraulics and the other with the solute. The model was applied to simulate the impact of highway deicing salts on groundwater quality in eastern Massachusetts. The results, obtained by digital computer simulation, were in reasonable agreement with observed trends over a 15-year period. The effects of various highway deicing alternatives were simulated and the dependence on the aquifer parameters was demonstrated. The application of this basin-wide modeling technique to the case of highway deicing salts demonstrated that this procedure can provide a reasonable basis for long-term evaluation of groundwater pollution. With adequate data on the inputs and aquifer parameters for a given locality,

this general technique can be used to guide regulatory procedures and land use decisions that can be applied at the local, regional, or state level to protect groundwater resources. (Visocky-ISWS)

HYDROCARBON DISPERSION IN GROUND WATER: SIGNIFICANCE AND CHARACTERISTICS,
Pennsylvania Dept. of Environmental Resources, Harrisburg. Bureau of Water Quality Management.
J. O. Osgood.
Ground Water, Vol 12, No 6, p 427-436, November-December 1974. 6 fig, 1 tab, 6 ref.

Descriptors: *Water pollution sources, *Organic compounds, *Path of pollutants, Pollution abatement, Groundwater, Gasoline, *Oil spills, Pipelines, Storage tanks, *Pennsylvania, Water table, *Dispersion, *Groundwater movement, Wells, Permeability, Porosity, Unconsolidated aquifers, Fractures(Geologic), Carbonate rocks, Gases, Secondary recovery(Oil), Costs, Leakage.

Groundwater contamination resulting from hydrocarbon spills is a significant problem that has received little attention. Over two hundred spills to the ground were investigated during the last two and a half years. The hydrogeologic characteristics at the spill site are critical in determining dispersion once the hydrocarbon has reached the water table. The hydrocarbon is largely contained on top of the water table. In unconsolidated deposits or in fill material, the shallow groundwater flow system and the direction of hydrocarbon dispersion will coincide. In sedimentary rocks, the orientation of the rock becomes critical. Dispersion will parallel the strike of the rock in more steeply dipping rocks rather than the major groundwater flow direction. Lateral movement will be controlled by jointing and fracturing. Solution channels and fractures exert the major controlling influence on heavily cemented soluble limestones. In tightly cemented clastics, crystalline rocks, and less soluble carbonates, contaminants flow on top of the water table in fractures. Recovery costs for most hydrocarbon spills are expensive and complete removal is extremely time-consuming. Better maintenance and emergency response plans must be developed. (Visocky-ISWS)

A STUDY OF POLLUTION LOADINGS FROM URBAN RUNOFF,
Windsor Univ. (Ontario). Dept. of Civil Engineering.
J. P. Hartt.
In: Water Pollution Research in Canada 1973, Vol 8, p 16-25, 1 fig, 6 tab, 11 ref.

Descriptors: *Water pollution sources, *Urban runoff, Storm water, Winter, Flow, Annual, Phosphates, Coliforms, Biochemical oxygen demand, Suspended solids, Chlorides, Nitrates, Sulfates, Nitrogen.
Identifiers: *Pollution loading, Quantification, Orthophosphates.

The qualitative values, ranges of values, and mean values, on a seasonal and annual basis for 19 physical, chemical, and bacteriological parameters in urban storm water runoff at a 89-acre subdivision in Windsor, Ontario were investigated. The rainfall and runoff quantities were recorded and thence the quantities of the pollutants in pounds per acre per season were determined. To explain the reason for the great difference in pollutional loadings from season to season when rainfall and pollutant concentrations changed very little, runoff coefficients were calculated from rainfall records and storm runoff data collected at the site. The pollutional loadings generated by a given rainfall in a particular season probably are more significant than the concentration of a particular pollutant at a given time, in attempts to quantify the pollution reaching a receiving water on a seasonal or annual basis. The large seasonal runoff coefficient differences that occurred in this study (0.84 in winter and 0.14 in fall) is a most important factor in explaining why the winter portion of the annual pollution load is so high. It is increasingly evident that storm runoff loadings are probably greater pollution sources to receiving waters than effluents from municipal secondary sewage treatment plants. R. Y. Ting, O. H. Wheeler, and E. Robles de Irizarry.
Report No COM-74-10086, January 1973. 36 p, 1 fig, 3 tab, 5 ref.

Descriptors: *Mercury, *Data collections, *Aquatic animals, *Distribution patterns, Fish, Pollutants, Invertebrates, Heavy metals, Aquatic life, Sampling, Animal physiology, Analytical techniques, *Puerto Rico, Pollutant identification, *Path of pollutants.

The levels of concentration of mercury in the flesh of the majority of fish and invertebrates commonly taken for consumption in Puerto Rico were below the maximum permissible level set by the Federal Food and Drug Administration. However, the flesh of larger pelagic carnivorous fish such as the great barracuda, blue marlin, and kingfish often exceeded the 0.5 ppm level. The mercury concentrations in the flesh of a group of fish sampled in the same location and at the same time varied to a significant degree, but those of different weight classes under 400 g were not significantly different. In general, kidneys, livers and gall bladders contained higher levels of mercury than flesh. Fat tissues generally contained a very low amount of mercury. Dark flesh contained lower levels of mercury than white flesh. There were indications that the fish sampled from the waters adjacent to industrial and population centers had higher levels than those sampled from relatively isolated areas; systematic sampling is required for verification. Herbivorous fish, in general, contained less mercury than carnivorous fish of comparable weight. (Jernigan-Vanderbilt)

EVALUATING WELL CONSTRUCTION, (PART II),
Agricultural Research Service, Beltsville, Md.
E. E. Jones, Jr.
Journal of Environmental Health, Vol 26, No 6, May-June, 1974. 7 p, 3 fig, 4 tab.

Descriptors: Water wells, *Groundwater, Water pollution, Soil contamination, Sampling, Hydraulics, Boreholes, Strength of materials, Public health, Coliforms, Pesticide residues, Soils, Oil wastes, Organic wastes, Organic matter.
Identifiers: *Well construction, Well bore, Contaminated wells, United States Geological Survey, State Ground Water Resources Agency.

Information is presented on contaminant characteristics and the behavior of contaminants in soil and water. The information can help plan sampling programs to provide better information for evaluation of well construction. A good well is known by the good water of reasonably uniform quality that it produces. As no well is contaminated the same amount at all times, indication of rapid changes in water quality with time after the initiation of pumping can be used to differentiate between contamination entering the well and poor groundwater quality. Entry of the contaminant involves three factors: (1) the contaminant source, (2) a transmission path, and (3) a transmitting fluid. Many factors are involved in the residual contaminant concentration in a well water sample. Knowledge of the nature and behavior of the contaminant can provide important clues to the path of entry and aid in determining the deficiencies in the sanitary protection of the well. MANURE STACK FLY BREEDING DEPENDS ON THE AMOUNT OF MANURE ADDED DAILY,
Wisconsin Univ., Madison.
W. L. Gajmerac.
Hoard's Dairyman, Vol 117, No 12, p 747, June 25, 1972. 1 fig.

Descriptors: *Breeding, *Farm wastes, *Waste disposal, *Waste storage, *Dairy industry, Agricultural runoff, Waste treatment.
Identifiers: *Manure stock, *Flies.

Recent work on a 40 head Wisconsin dairy farm showed that the daily summer addition of all manure from a dairy herd will cause an increase in housefly population. To help control fly population, it is suggested that the dairymen stack all the manure during the winter and spring, hold the stacked manure until fall, then spread it and plow it under immediately. This lets the dairymen haul the manure in the fall when they have more free time and it cuts down on polluted runoff into waterways. It is believed that beneficial insects and mites inhabit the old stacks and eat the fly eggs and maggots. If only small amounts of manure are added daily during the fly breeding season these beneficial insects manage to keep fly population low. However, if large amounts of fresh manure are added daily, these insects cannot keep up with the fly reproduction. It is suggested that local health officials be contacted concerning their opinion toward flies before new manure handling facilities are developed. (Lee-East Central)

PHYTOPLANKTON WHICH ARE POLLUTION INDICATORS IN LAKES, (IN SWEDISH),
Vandkvalitetsinstitut, Soborg (Denmark).
K. Olrik.
Vatten Vol 29, No 3, p 290-301, 1973. English summary.
Identifiers: Attheya, Ceratium-hirundinella, *Denmark(Zealand lake system), Dinobryon, Lakes, Mallomonas, Microcystis, Peridinium, *Phytoplankton, Pollution, Primary production, Seasonal, Stephanodiscus, Synura, *Bioindicators, Water pollution sources.

A brief review is given of the methods for qualitative and quantitative investigations of freshwater phytoplankton (Nygaard's compound quotient and Utermohl's counting technique). The seasonal variation of the phytoplankton as well as the changes in quality and quantity of the phytoplankton in an alkaline lake, as a result of increasing nutrient contents of the water is illustrated by an example from a lake system in North Zealand (Denmark). The clean water diatom Attheya is the 1st to disappear, several species of the dinophycean genus Peridinium and the chrysophycean genera Dinobryon, Mallomonas, and Synura disappear next and last the dinophycean species Ceratium hirundinella disappears; whereas the blue-green algal genus Microcystis and the diatom genus Stephanodiscus increase greatly. The methods give a good supplement to the ecological knowledge of the lake, gained by measurements of primary production and water chemistry.--Copyright 1974, Biological Abstracts, Inc.

CONTENT OF CHEMICAL SUBSTANCES IN FARM CROPS GROWN ON SOIL IRRIGATED WITH WASTE WATERS OF COKE BY-PRODUCT PLANTS, (IN RUSSIAN),
Kiev Inst. of Nutritional Hygiene (USSR). Physicochemistry Lab.
N. M. Barabanova, L. R. Polishchuk, and L. A. Stempkovskaya.
Vopr Pitan, Vol 32, No 5, p 76-79, 1973.
Identifiers: *Ammonia, *Byproducts, Chemicals, *Chlorides, Coke, Corn(Field), *Crops, Farm, Irrigated soils, *Nitrates, Nitrites, Potatos, Soil, *Sulfates, Waste waters, Industrial wastes, Water pollution sources.

Potatoes and corn were grown on soil irrigated with waste waters of coke by-product plants. Both crops accumulated nitrates, ammonia, sulfates and chlorides. In the potato tubers there was a high content of monatomic phenols and nitrites. Other organic substances (sulfides, cyanides and thiocyanates) were not found in the plants, probably because of their breakdown in the soil and plants.--Copyright 1974, Biological Abstracts, Inc.

CHANGES IN THE ECONOMY AND ECOLOGY AT PROPOSED LAKE SITES IN THE SALT RIVER BASIN, KENTUCKY, DURING EARLY CONSTRUCTION OF THE DAM FOR TAYLORSVILLE LAKE,
Kentucky Water Resources Research Inst., Lexington.
L. A. Krumholz, and S. E. Neff.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 628, $3.75 in paper copy, $2.25 in microfiche. Research Report No 78, October 1974. 36 p, 1 fig, 6 tab, 16 ref. OWRT B-031-KY(1). 14-31-001-3891.

Descriptors: *Suspended solids, Benthos, *Caddisflies, Aquatic insects, Drift, Sediment, *Turbidity, *Ecology, Aquatic habitats, Limnology, Water quality, Environmental effects, *Kentucky, Economics, Natural resources, Benefits, Planning, Sites, Lakes, Early impoundment, *Pre-impoundment.
Identifiers: *Salt River basin(Kent).

Permanent collecting stations have been established at 67 sites throughout the Salt River, Beech Fork, and Chaplin River drainages. Turbidities increase quickly as flow and runoff increase, and subside quickly when the rain stops. Suspended solids range up to 1,700 mg/l in high turbidities and vary considerably as a result of local spates. Water chemistry generally reflects the limestone nature of the substrate and the physico-chemical characteristics of a typically healthy limestone stream. Bottom organisms are abundant and diverse, more than 300 different benthic organisms have been identified to date. Drift samples exhibit extremely high densities ranging from 0.1 to 28 organisms percubic meter of discharge, with as many as 315,000 organisms passing the same point during peak drift activity. Species diversity of caddisflies was calculated for 85 quantitative samples. The greatest numbers emerge at dusk with sex ratios about 1:1, and with production ranging from 4.3 to 24.3 mg/sq m. The amount of land needed for a recreational area is about 4,300 acres. (Grieves-Kentucky)

PURIFICATION OF APHANIZOMENON FLOS-AQUAE TOXIN AND ITS CHEMICAL AND PHYSIOLOGICAL PROPERTIES,
New Hampshire Univ., Durham. Dept. of Biochemistry.
M. Alam, M. Ikawa, J. J. Sasner, Jr., and P. J. Sawyer.
TOXICON, Vol 11, No 1, p 65-72, 1973. 2 fig, 3 tab, 14 ref. OWRT A-013-NH(7).

Descriptors: Algae, *Cyanophyta, Aquatic plants, Algal poisoning, *Algal toxins, *Eutrophication, Chemical properties, Biological properties, *New Hampshire.
Identifiers: *Aphanizomenon flos-aquae, *Kezar Lake(NH).

A toxin in chromatographically pure form has been isolated from natural blooms of the blue-green alga Aphanizomenon flos-aquae. The toxin is a strongly basin substance, which gives a positive ninhydrin reaction and appears to be a guanidine derivative. A dose of 2.7 micro g injected intraperitoneally into 20 g mice caused death in 4.9 min. The purified toxin reversibly blocks action potentials and tension development in amphibian nerve-muscle preparations without alteration of the resting potential. The toxin differs from saxitoxin in some of its chemical and physical properties, and some of its effects on neuromuscular systems.

SPECIFIC PRODUCTION OF AQUATIC INVERTEBRATES,
V. E. Zaika.
Halsted Press, a division of John Wiley and Sons: New York, NY, 1973. 154 p. Pr $19.75.
Identifiers: Age, *Aquatic animals, Growth, *Invertebrates, Reproduction, *Specific production, Temperature, *Productivity, Publications.

An analysis of the principles and patterns which determine the productivity level of aquatic invertebrate populations; the theoretical concepts and problems concerning the production process in biosystems; and the basic concepts and parameters, and mathematical expression of the basic quantities and relations between them are presented. A chapter dealing with animal growth and the relationship between growth and productivity and the correlation between maximal specific growth rates is included. A chapter on methods for calculating the production of animal populations, production of microorganisms and production of multi-cellular animals is represented. The 4th chapter discusses productivity of infusorians. The specific production of rotifers, annelids and monogenetic trematodes, crustaceans, aquatic larvae, insects, mollusks and echinoderms is dealt with. Comments are given on the results of the author's own investigations into principles determining the specific production of the population. An extensive list of references is included.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Carriers, Environment, *Epidemiologic studies, Germany, Gulls, Lakes, Pollution, *Salmonella, Salmonella-bareilly, Salmonella-manchester, Sea, Sewage, Soil, Turtles, Vectors, *Switzerland(Lake of Constance), Waste water treatment.

In a 2-yr epidemiologic investigation (1969-1970) a correlation was demonstrated between salmonellae found in sewage in St. Gall and 59 registered human Salmonella excreters. With the exception of Salmonella bareilly, the Salmonella serotypes and phagotypes isolated from these patients were also isolated from sewage. In some cases, a relationship existed between Salmonella isolated from sewage and from certain animal excreters (seagulls and turtles) and foodstuffs. Of 46 different Salmonella serotypes demonstrated in sewage, 26 originated from these sources. The role of seagulls as a Salmonella vector on the shore of the Lake of Constance and the near vicinity was investigated. From 3 landings on the Lake of Constance (Romanshorn, Arbon and Rorschach) 996 samples of sea-gull droppings were collected and examined bacteriologically; 6.9% of the samples were positive for Salmonella. The seasonal migration of sea-gulls suggests that S. manchester was introduced from the coastal region of Northern Germany. Examination of sludge and clarified sewage water from the drainage systems of sewage treatment plants in St. Gall showed that neither an out-dated and over-worked sewage treatment plant nor a modern sewage treatment plant was able to remove the Salmonella from sewage. Salmonellae were returned to the environment in the clarified sewage water and in the sludge which was used as fertilizer.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF SALINITY ON THE EGGS AND LARVAE OF THE CALIFORNIA KILLIFISH FUNDULUS PARVIPINNIS,
Fisheries Research Board of Canada, Nanaimo (British Columbia). Biological Station.
T. R. Rao.
Mar Biol (Berl), Vol 24, No 2, p 155-162, 1974.
Identifiers: *California killifish, Colonization, Eggs, Freshwater fish, Fundulus-parvipinnis, Larvae, Optimum, Physiological studies, *Salinity, Water pollution effects.

Incubation salinities over the range of 5-14% S (salt water) produced the shortest incubation period, maximum yolk-conversion efficiency, lar-

gest larval size at hatching and maximum viable hatch. Various morphometric measurements of the newly-hatched larvae were influenced significantly by incubation salinity. Fertilization salinity also affected certain development criteria; in general, lower fertilization salinities resulted in shorter incubation periods and larger larvae at hatching. A salinity range of 5-14% S is suggested as a physiological optimum and the known freshwater affinity of the species suggests that an eventual freshwater colonization by the California killifish is possible.--Copyright 1974, Biological Abstracts, Inc.

THE ENTERPRISE, WISCONSIN, RADIATION FOREST - PREIRRADIATION ECOLOGICAL STUDIES.
Atomic Energy Commission, Washington, D.C.
Available from the National Technical Information Service, Springfield, Va. 22161, as Rept No TID-26113, $7.60 in paper copy, $2.25 in microfiche. TID-26113, June 1974. 157 p, 90 fig, 73 tab, 164 ref.

Descriptors: *Forests, *Great Lakes region, *Wisconsin, *Radioactivity effects, Genetics, Research and development, Research facilities, *Cesium, Populations, Animals, Plants, Census, Plant growth, Animal growth, Litter, Leaves, Density, Canopy, Biological communities, Surveys.
Identifiers: *Gamma radiation, *Enterprise radiation forest.

The research on which the papers in this volume are based is an expansion of radiation studies begun at the Institute of Forest Genetics in 1961. The information to be obtained would complement radioecological results obtained in studies of other types of forests, such as those on Long Island and in Puerto Rico. Plans were developed for a research program to extend over a 20-year period and to include irradiation of various northern forest types during different seasons of the year, as well as a 5-year exposure of one of the major northern forest types, namely, aspen. The papers in this volume are concerned with preirradiation studies on the first site chosen for irradiation. The information is largely descriptive of the physical and biological environments of the Enterprise Radiation Forest and is intended to supply reference and base-line information not only for evaluating the gamma-radiation impact but also on the ecology of some important northern forest types. THE ENTERPRISE RADIATION FOREST RESEARCH FACILITY,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
T. D. Rudolph.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological studies, Report No TID-26113, p 1-16, June 1974. 14 fig, 1 tab, 10 ref.

Descriptors: *Forest management, *Ecology, *Radiation, *Radioactivity effects, *Cesium, Research and development, Research facilities, Natural resources, Great Lakes region, Irradiation, Genetics, Sites, Locating, Mapping.

A 1440-acre forest in northern Wisconsin which is being used for gamma-irradiation studies on various northern forest communities is described. A brief history of the area, which is typical of much of the upper Great Lakes forest region, is presented together with a description of its current condition. Development of the tract into a radiation research facility is described. A 10,000-Ci Cs-137 radiation source was used. Studies on each radiation site will include characterization of the pre-irradiation communities, changes occurring during irradiation, and postirradiation recovery. (See also W75-03401) (Houser-ORNL)

DESCRIPTION OF EXPERIMENTAL PLOT DESIGN OF SITE 1 AND THE CONTROL AREA,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
B. J. Salmonson, R. W. Blank, and R. L. Nelson.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 17-31, June 1974. 20 fig, 5 ref.

Descriptors: *Sites, Locations, *Explorations, *Habitats, *Radioactivity effects, *Mapping, Stations, *Phenology, Zoning, Management, Topography, Control, Forest management, Vegetation, Mammals, Soils, Climatology, Measurement, Sampling, Radioactivity, Meteorology, Rainfall.

Initial studies in the Enterprise Radiation Forest were begun in 1968, and the locations of radiation site 1 and the control area were selected in July 1969. Once the location of site 1 was determined, work was immediately begun to establish transects and sampling plots in site 1 and the control area. Weather stations established in 1968 have been maintained since that time. During August 1969 the ground vegetation was sampled and the species were identified. Also at that time the trees were numbered, measured for diameter at breast height, and identified. In June 1970 the exact locations of the trees relative to the center of site 1 were determined by transit. Small mammal trapping grids were also established in the spring of 1970, and a systematic live-trapping schedule was initiated. The dosimetry design was formulated in 1971, and the field work was completed early in 1972. A detailed description of the methods used in establishing the experimental-plot design in site 1 and the control area is presented. (See also W75-03401) (Houser-ORNL)
W75-03403

SOLAR RADIATION MEASUREMENTS IN THE ENTERPRISE RADIATION FOREST,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
J. Zavitkovski.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 33-45, June 1974. 6 fig, 7 tab, 19 ref.

Descriptors: *Forest management, Research and development, Radioactivity, *Radioactivity effects, Measurement, Genetics, *Birch trees, *Maple trees, *Solar radiation, Light, Meteorology, Hardwood, Canopy, Trees, Ecology, Genetics.
Identifiers: *Aspen trees.

Solar radiation was measured in the open and under canopies of several forest types in northern Wisconsin by means of a recording pyranograph and petroleum-ether chlorophyll extracts. Cumulative solar energy in the open was substantially higher in the generally sunny period from April to November 1970 than in the same period in 1971 and 1972, which in both years was cloudy. Depending on cloudiness, the average daily maxima may occur in May (471 langleys in 1972), June (441 langleys in 1971), or July (577 langleys in 1970). Compared with published averages for the Midwest, the measured solar energies were low, probably because of the excessive cloudiness in the Great Lakes region. The highest solar energies under canopies were determined in the aspen forest, followed in decreasing order by birch, maple-aspen-birch, and northern hardwood forest types. Highest absolute solar energies, about 2800 to 3000 langleys/month (or about 20 to 23% of the energy in the open), were determined in all four forest types in May, but relatively more energy (27 to 36%) reached the forest floor in November under leafless canopies. Very low relative values of 2.1, 3.2, 4.2, and 5.9% of the energy in the open were measured under canopies in leaf in the northern hardwood, maple-aspen-birch, birch, and aspen forest types, respectively. (See also W75-03401) (Houser-ORNL)
W75-03404

LICHENS OF THE ENTERPRISE RADIATION FOREST,
Michigan Technological Univ., Houghton.
F. H. Erbisch.
In: The Enterprise, Wisconsin, Radiation Forest-Preirradiation Ecological Studies, Report No TID-26113, p 47-53, June 1974. 10 fig, 3 tab, 14 ref.

Descriptors: *Forest management, Radioactivity, *Radioactivity effects, *Genetics, *Lichens, *Fungi, Sessile algae, Irradiation, Damages, Measurement, Plant growth, Environmental effects, Temperature.

The effects of both environmental change and gamma radiation on lichen thalli in their native habitats are questionable. This study attempts to determine both the macro- and microscopic effects of these two factors on lichen thalli at the Enterprise Radiation Forest. Measurements and observations of thallus growth, configuration, and coloration; substrate temperature; thallus internal structure; and transplanted thalli are being made before irradiation for comparison with measurements and observations after the radiation treatment. The drastic environmental change caused by irradiation of the higher plants and their subsequent death or growth retardation will also affect the lichens. Which will have the greater effect and what the combined effect will be is to be determined. (See also W75-03401) (Houser-ORNL)
W75-03405

FLORA OF THE ENTERPRISE RADIATION FOREST,
Nicolet Coll.-Technical Inst., Rhinelander, Wis.
J. Clausen.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 55-61, June 1974. 2 tab, 3 ref.

Descriptors: *Forest management, *Ecology, Radioactivity, *Radioactivity effects, *Vascular tissues, Plant tissues, Plant morphology, Vegetation establishment, Varieties, Genetics, Vegetation, *Plant groupings.

The 193 vascular plant species recorded in the Enterprise Radiation Forest are listed. Information on Longevity, abundance, and existence of voucher specimen is given for each species. The gound-cover flora of this forest most closely resembles that of the Wisconsin northern drymesic type described by Curtis (1959). The 193 species recorded within the transects of site 1 of

the radiation area are listed. (See also W75-03401) (Houser-ORNL)
W75-03406

DESCRIPTION AND CLASSIFICATION OF PLANT COMMUNITIES IN SITE 1 AND THE CONTROL AREA,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
J. Zavitkovski.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 63-84, June 1974. 1 fig, 23 tab, 13 ref.

Descriptors: *Forests, *Radioactivity effects, *Genetics, *Speciation, *Varieties, Surveys, Ecology, Sampling, Sites, Plant groupings, Biological communities, Plant growth, Forecasting, Projections, Birch, Density, Population.
Identifiers: *Aspen.

Nine forest and three logging-road plant communities were sampled in the Enterprise Radiation Forest in northern Wisconsin. These communities were quantitatively described by simple ecological indicators - frequency, density, and basal area or cover - and were classified by comparing them to standard cover types of three classification systems. Three forest communities were similar to the aspen cover type, three others to the aspen-paper birch cover type, and one each to the paper birch and sugar maple-basswood cover types. One community was transitional. Seven of the nine communities were in early and two in more-advanced successional stages. Paper birch, red and sugar maple, and quaking aspen headed the list of important species, followed by beaked hazel, Carex pensylvanica, and large-leaved aster. Among the top 23 species were 11 trees, 2 shrubs, and 10 herbs. The future composition of the nine stands is predicted on the basis of the relative representation of young tree, sapling, and tree-seedling species. (See also W75-03401) (Houser-ORNL)
W75-03407

PHYSICAL CONDITION AND DIMENSIONS OF TREES IN SITE 1 AND THE CONTROL AREA,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
J. Zavitkovski.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 85-95, June 1974. 23 fig, 6 tab, 11 ref.

Descriptors: *Forests, Ecology, Radioactivity, *Radioactivity effects, *Trees, *Surveys, *Measurement, Physical properties, Size, Dimensions, Graded, Shape, Research and development, Biological communities.

Physical conditions of trees composing nine forest communities of the Enterprise Radiation Forest are described and relationships between their age, size, and crown dimensions are established. The trees, mostly of vegetative origin, were reasonably healthy and free of serious mechanical damage. They varied widely in age, size, and crown dimensions, but for individual species good relationships existed among these variables. The trees and the nine forest stands provide suitable and biologically interesting study material for a pilot study on the effects of ionizing radiation on natural forest ecosystems. (See also W75-03401) (Houser-ORNL)
W75-03408

PROPERTIES OF THE TREE FLORA IN THE FOREST TRANSITION FROM ASPEN TO MAPLE-BIRCH TYPE,
Michigan State Univ., East Lansing.
P. G. Murphy, and R. R. Sharitz.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 97-104, June 1974. 4 fig, 6 tab, 12 ref.

Descriptors: *Forests, Ecology, Biological communities, *Canopy, Trees, *Aspen trees, Ecological distribution, Comparative productivity, *Birch trees, *Maple trees, Environmental effects, Foliar, Radioactivity effects, Mortality, Epidemiology, Forecasting, Projections.

Five belt transects were used to study certain properties of the tree flora in a zone of transition between an aspen-dominated area and a maple-birch-dominated area in the Enterprise Radiation Forest. The properties studied included tree-species composition of the canopy, sapling, and seedling strata; population densities; species importance values; species diversity; and leaf-area index. On the basis of known ecological characteristics of the dominant species, leaf-area index, species diversity, and an analysis of similarity between canopy and understory three-species composition, the ecotone appears to include forest types representing three stages of maturity, from the least mature aspen area to the most mature, although still successional, maple-birch area. Because of a complicated and undocumented history of disturbance in the area, the ecotone is not assumed to represent a typical forest sere for undisturbed succession at the Enterprise site. It is predicted that the aspen area will experience the greatest aboveground tree mortality in response to chronic gamma irradiation but that this area will also be the quickest to recover to an approximate preirradiation condition. The overall ecological effect in all areas along the transition will be a setback in successional status, which will be evidenced by changes in the parameters documented in this study. (See also W75-03401) (Houser-ORNL)
W75-03409

PREDICTED EFFECTS OF CHRONIC GAMMA IRRADIATION ON NORTHERN FOREST COMMUNITIES,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
J. Zavitkovski, T. D. Rudolph, and E. O. Bauer.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 137-144, June 1974. 7 tab, 30 ref.

Descriptors: Radioactivity effects, *Forecasting, Biological communities, *Radiation, *Cesium, Genetics, *Forests, *Plant growth, *Great lakes region, Environmental effects, Vegetation, Trees, Density, Population, Census, Shrubs, Damages, Ecosystems, Chromosomes, Cytological studies, Revegetation.
Identifiers: *Radioactivity damage.

A prediction of the effects of gamma radiation (growing-season exposure) on natural northern forest communities has been developed based on vegetation survey, determination of interphase chromosome volumes (ICV) of the most important plant species, and reported relationships between ICV and radiosensitivity. The ICV's of angiosperm tree, shrub, and ground-vegetation species ranged from about 1.5 to 7.3 cubic micron, and those of gymnosperm trees from 30.2 to 52.0 cubic micron. Lichens and bryophytes are common and because of their high radio-resistance should survive in the innermost zone. A Carex zone with some Lycopodiaceae should develop around this innermost zone; this should be followed by a zone dominated by Corylus cornuta and several species of Ericaceae. The transition between the third and fourth zone may be very diverse, with Corylus and Amelanchier, some Polypodiaceae, and perhaps some resistant tree genera such as Tilia, Fraxinus, and Prunus. (See also W75-03401) (Houser-ORNL)
W75-03410

TEMPORAL AND SPATIAL PATTERNS OF PRETREATMENT LITTER PRODUCTION IN SITE 1 AND THE CONTROL AREA,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
T. R. Crow.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 105-113, June 1974. 7 fig, 7 tab, 6 ref.

Descriptors: *Litter, *Forests, *Genetics, Ecology, *Trees, *Temporal distribution, *Ecological distribution, *Leaves, Migration patterns, Distribution, Spatial distribution, Radioactivity effects.
Identifiers: *Litter fall.

Between August 1969 and May 1972, year-round collections of litter fall were obtained in aspen, birch, and northern hardwood communities in site 1 and similar communities in the control area of the Enterprise Radiation Forest. In both areas total litter production was greatest in the northern hardwood forest type, intermediate in birch, and lowest in aspen. The differences proved statistically significant in the control area but not in site 1. Differences among years were also significant in terms of total litter production but were not significant for leaf-litter production. Because of its spatial and temporal (on an annual basis) uniformity relative to other litter components, leaf litter should provide the best indicator of perturbation related to chronic gamma irradiation. (See also W75-03401) (Houser-ORNL)

LEAF-LITTER PRODUCTION IN THE ASPEN AND MAPLE-BIRCH FOREST TYPES AND THE CONTRIBUTION BY INDIVIDUAL TREE SPECIES,
Michigan State Univ., East Lansing.
P. G. Murphy, R. R. Sharitz, and A. J. Murphy.
In: The Enterprise, Wisconsin, Radiation, Forest - Preirradiation Ecological Studies, Report No TID-26113, p 115-118, June 1974. 1 fig, 3 tab, 9 ref.

Descriptors: *Litter, Leaves, *Productivity, Annual turnover, Comparative productivity, *Maple trees, *Birch trees, *Radioactivity effects, Ecology, Canopy, Biomass, Speciation, Biological communities, Environmental gradient, Latitudinal studies, Dominant organisms, Ecotypes.
Identifiers: *Aspen trees, *Leaf-litter, Foliage.

Immediately following leaf fall in 1971, leaf-litter samples were collected from two forest types, aspen and maple-birch, and from an intervening zone of transition. Only leaves that fell in 1971 were collected. Leaf-litter fall for trees averaged 134 kg/m sq of basal area in the aspen area and 142 kg/m sq in the maple-birch area. Total tree and shrub leaf-litter fall was estimated to be 2.32 tonnes/ha in the aspen area and 2.63 tonnes/ha in the maple-birch area. Shrub leaf-litter fall was greatest in the aspen area, 5.4% of total leaf-litter fall. The relation between relative basal area and relative leaf-litter biomass for tree species was approximately 1:1. Diversity values computed on the basis of number of leaves per species or on biomass of leaves per species indicated that the maple-birch foliage was not diverse and the aspen foliage least diverse. VERTEBRATES OF THE ENTERPRISE FOREST: A GENERAL SURVEY,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
R. R. Buech.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 119-122, June 1974. 5 tab, 4 ref.

Descriptors: *Animal populations, *Surveys, *Census, *Wildlife, *Forests, Genetics, Amphibians, Reptiles, Birds, Mammals, *Radioactivity effects, Research and development, Ecology, Ecosystems, Speciation, Nests, Morbidity, Habitats, Wildlife habitats, Behavior.
Identifiers: *Vertebrates, Aves.

Studies of the effects of gamma radiation on northern forest ecosystems are in progress at the Enterprise Forest in northern Wisconsin. A separate species list is presented for four classes of vertebrates, Amphibia, Reptilia, Aves, and Ammalia, found in the radiation forest. The lists will benefit people with specific interest in suitable study material for subsequent radiation experiments as well as those with a general interest in the vertebrate fauna of the area. The lists range from accurate for mammals to incomplete for avian forms. (See also W75-03401) (Houser-ORNL)
W75-03413

SMALL-MAMMAL POPULATIONS IN SITE 1 AND THE CONTROL AREA,
Forest Service (USDA), Rhinelander, Wis. North Central Forest Experiment Station.
R. R. Buech.
In: The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies, Report No TID-26113, p 123-135, June 1974. 4 fig, 3 tab, 28 ref.

Descriptors: *Small animals(Mammals), *Census, *Mammals, *Small game, *Wildlife, Animal groupings, Animal populations, *Cesium, *Radioactivity effects, Ecology, Genetics, Biological communities, Distribution patterns, Trapping, Reproduction, Animal physiology, Weight, Mortality, Breeding, Snow cover.

A live-trap study of small-mammal populations and their response to gamma radiation is in progress in the Enterprise Radiation Forest near Rhinelander, Wisconsin. Trapping in northern forest communities has been conducted on a monthly basis since May 1970, along two grids totaling 8.9 ha in size. Data gathered from the two grids before radiation treatment were combined to present information concerning the trappability, populations, reproduction, and body weight of the most prominent species. Species studied are the red-backed vole (Clethrionomys gapperi), the short-tailed shrew (Blarina brevicauda), the eastern chipmunk (Tamias striatus), the meadow vole (Microtus pennsylvanicus), the woodland deer mouse (Peromuscus maniculatus gracilis), and the white-footed mouse (P. leucopus). TEMPERATURE EFFECT ON BRAIN GLYCOGEN OF FISH,
Universitaet Hohenheim (Landwirtschaftliche Hochschule) (West Germany). Zoological Inst.
H. Breer, and H. Rahmann.
Brain Research, Vol 74, No 2, p 360-365, July 12, 1974. 3 fig, 19 ref.

Descriptors: Investigations, *Temperature, *Fish physiology, *Thermal stress, Seasonal, *Water pollution effects, Water temperature.
Identifiers: *Goldfish, Brains, Livers, Fish CNS, Glycogen levels.

Investigations were undertaken to determine possible seasonal changes of the concentration of brain glycogen and to study the influence of temperature, one of the critical factors in the life of aquatic poikilotherms, on the glycogen metabolism and fish CNS. The experiments were performed on Scardinus erythrophtalmus and on Carassius auratus. Results show that there are very different responses of both brain and liver organs under thermal stress. In the liver, glycogen levels are constant, whereas in the brain, glycogen levels are influenced by the water temperature. Also, the intensified accumulation of glycogen in cold-acclimatized goldfish brains is an adaptation process which starts immediately after the temperature changes; it is particularly intensive during the first hours but can be observed for over several weeks. Contrary to the results of the experimental temperature test, under natural conditions there was an accumulation of glycogen, in brain as well as in liver, during cold seasons. It could not be shown from these findings which subcellular compartments are responsible for the increased glycogen storage in the cold. (Sandoski-FIRL)

SUBACUTE TOXICITY OF METHYLMERCURY IN THE ADULT CAT,
Food and Drug Directorate, Ottawa (Ontario). Food Research Labs.
S. M. Charbonneau, I. C. Munro, E. A. Nera, R. F. Willies, and T. Kuiper-Goodman.
Toxicology and Applied Pharmacology, Vol 27, No 3, p 569-581, March, 1974. 6 fig, 3 tab, 22 ref.

Descriptors: *Toxicity, *Mercury, Fish, *Canada, Pollution, Animal pathology, Food chains, Fish dieases, Water pollution effects.
Identifiers: *Cats, *Methylmercury, Methylmercuric chloride.

Some species of edible fish from Canadian waters contained hazardous levels of methylmercury. A guideline for sale of fish was set at 0.5 ppm Hg. Since fish represents the major source of dietary methylmercury, studies for assessing toxicity of fish in polluted waters were conducted. Cats were used because their clinical and pathological features are similar to humans who consumed toxic quantities of food containing methylmercury. A dose of 0.25 mg Hg/kg/day was administered to two groups of cats for 12-14 weeks, either as pure methylmercuric chloride or as methylmercury-contaminated fish. A control group received a diet containing uncontaminated fish. Clinical signs of methylmercury intoxication consisting of ataxia, intention tremor and impaired righting reflex and convulsions developed between 55 and 96 days in both treated groups, at which time the total dose received was between 14 and 24 mg Hg/kg. Tissue mercury content was similar in both groups of treated animals, as were the pathologic changes. Lesions were found in the cerebellar vermis and the cerebral cortex. The changes consisted of loss of nerve cells with replacement by reactive and fibrillary gliosis. Chromosome studies of terminal bone marrow samples showed no abnormalities. (Prague-FIRL)

ADVISORY REPORT ON HEALTH EFFECTS OF NITRATES IN WATER.
Illinois Inst. for Environmental Quality, Chicago.
Available from National Technical Information Service, U.S. Dept. of Commerce, Springfield, Va 22161 as PB-229 500, $3.75 in paper copy, $2.25 in microfiche. Report IIEQ 74-5, January 1974. 39 p, 2 fig, 7 tab, 54 ref.

Descriptors: *Nitrates, *Evaluation, *Illinois, *Water pollution effects, *Water supply, Planning, Environmental effects, Water quality, Water pollution sources, Water policy, Water pollution, Municipal water, State governments, Water demand, Water pollution control, Water quality standards, Water treatment, Water pollution treatment, Water quality control, Water supply development, Water management(Applied), Water allocation(Policy).
Identifiers: *Hazardous substances(Pollution), Non-point sources(Pollution), Environmental policy, State policy.

Possible adverse health consequences of continued use of waters with elevated nitrate levels as drinking water supplies are discussed. Data gathered by the Illinois Environmental Protection Agency indicated that several surface water supplies and public well water supplies in Illinois had often exceeded the U.S. Public Health Service Drinking Water Standard for nitrates. The following recommendations were made: (1) The present limit of 10 ppm nitrate-nitrogen should be maintained. (2) Certain populations which might be more susceptible to the effects of elevated nitrate levels than the average population should be protected. (3) Epidemiologic studies should be undertaken. (4) Research into the reactions with other substances in the water should be undertaken. (5) Available treatment methods for the removal of nitrates from water supplies should be used. (Deckert-Florida)

ACCUMULATION, DISTRIBUTION, TRANSFORMATION AND ELIMINATION OF DDT-14C IN SOLEA SOLEA (PISCES: SOLEIDAE), (IN GERMAN),
Institut fuer Meeresforschung, Bremerhaven (West Germany).
W. Ernst, and H. Goerke.
Mar Biol (Berl), Vol 24, No 4, p 287-304, 1974, Illus.
Identifiers: Bacteria, *DDT-Carbon-14, *Distribution, Elimination, Flora, Gut, *Insecticides, Pisces, *Solea-solea, Soleidae, Transformation, *Absorption.

Common soles S. solea (L.) are extremely suitable for studying the fate of pesticides in marine fish by means of laboratory experiments involving small-sized, accurately controlled, closed aquarium systems. In 5 different experiments on 16 fishes the decreasing accumulation percentages with increasing doses, i.e., with longer application periods, were found to be due to elimination during the application period. During a period of 2 mo. in pesticide-free water, S. solea eliminated 62% of the DDT-14C which it had accumulated after feeding with 17 micrograms DDT-14C over a period of 4 wk. The gastrointestinal tract is assumed to be a major route of DDT elimination. Independent of dosage, there was a characteristic distribution pattern of accumulated DDT: brain, liver and gastrointestinal tract ranked highest, while the concentration in skeletal muscle was lowest. Even during the elimination period the pattern was unchanged. DDE, DDD and a polar component occurred as metabolites, but in all organs more than 80% of the accumulated DDT remained unchanged. Percentages of metabolites were high in liver and gastrointestinal tract than in skeletal muscle. Prolonged exposure to DDT in the diet induced DDT transformation in the gastro-intestinal contents, most probably in the bacterial flora of the gut.–Copyright 1974, Biological Abstracts, Inc.

ORGANOCHLORINE INSECTICIDE RESIDUES IN SEDIMENT AND FISH TISSUES, ONTARIO, CANADA,
Ontario Ministry of Agriculture and Food, Guelph. Pesticide Residue Lab.
R. Frank, A. E. Armstrong, R. G. Boelens, H. E. Braun, and C. W. Douglas.
Pestic Monit J, Vol 7, No 3/4, p 165-180, 1974, Illus.
Identifiers: Biological studies, *Canada(Ontario), Chlorodiphenyl, DDE, *DDT, *Dieldrin, Ethane, *Insecticides, Invertebrates, Plankton, Sediments, Soils, *Pesticide residues, *Fish tissue, Lake sediments.

River and lake sediments and several species of fish were collected from 4 study areas in the Province of Ontario. These consisted of 1 agricultural, 2 mixed agricultural-recreational, and 1 recreational study area. Large volumes of DDT and dieldrin were used in the 1st area, small quantities were used in the mixed areas, and insignificant quantities were used in the recreational area. The agricultural and mixed areas were located on deep alluvial soils; the recreational area was located on bare-to-thinly-covered Precambrian

rock. Metabolites, DDE and TDE (tetrachlorodiphenylethane) were predominate over the parent DDT. Residues of DDT and dieldrin in fish tissues tended to depend on feeding habits, fat content and age of the fish. Residues increased in the low-fat piscivores, were slightly higher in the high-fat feeders, and were highest in the high fat piscivores. The concentration of DDT and dieldrin in the tissues and extractable fat and the actual quantity accumulated per fish increased as size and weight of any 1 species increased. The increase in total DDT or dieldrin concentration from lowest to highest tissue residues of all fish species was of the order of 100-500 times; the increase in body load was of the order of 1000-10,000. Higher concentrations in fish tissue were correlated with the higher sediment levels of the Precambrian recreational area. The use of even minute quantities of persistent chlorinated hydrocarbons in rocky Precambrian watersheds has a profound effect on sediment and biota contaminants.--Copyright 1974, Biological Abstracts, Inc.

DATA ON SUBSTANTIATION OF THE MAXIMUM ALLOWABLE CONCENTRATION OF BUTYPHOS IN WATERS, (IN RUSSIAN),
Uzbekskii Nauchno-Issledovatelskii Institut Sanitarii, Gigieny i Profzabolevanii, Tashkent (USSR).
Yu U. Khasanov, and R. A. Akhmedova.
Gig Sanit, Vol 38, No 8, p 92-93, 1973.
Identifiers: Blood, *Butyphos, Cholin, Esterase, Guinea-pig, Liver, *Maximum allowable concentration, Mouse, Rabbit, Rat, Taste, Tests, *Lethal limit, *Toxicity, Water pollution effects, Organoleptic properties.

The toxicity of this defoliant was determined on white mice, rats, guinea pigs and rabbits with a single administration into the gastrointestinal tract. Its cumulative properties, cholinesterase activity in the blood and biochemical indices characterizing liver function were investigated. On the basis of its weak cumulative properties and the large gap between the toxicological threshold dose and the threshold concentration with respect to the taste of water (about a million-fold), 0.0003 mg/l was taken as the maximum allowable concentration in bodies of water on the basis of an organoleptic index of acceptability.--Copyright 1974, Biological Abstracts, Inc.

PHYSIOLOGICAL EFFECTS OF A SUBLETHAL CONCENTRATION OF PHENOL IN THE PIKE (ESOX LUCIUS L.) IN PURE BRACKISH WATER,
Helsinki Univ. (Finland). Dept. of Zoology.
R. Kristoffersson, S. Broberg, and A. Oikari.
Ann Zool Fenn, Vol 10, No 2, p 392-397, 1973, Illus.
Identifiers: Amino acids, Brackish water, Metabolism, *Phenols, Physiological studies, *Pikes, *Sublethal limit, Water pollution effects, Toxicity.

The effect of phenol on pike (E. lucius) living in brackish water of relatively stable salinity, 5-6%, was studied in continuous-flow aquarium experiments. The highest concentration for survival for at least 1 wk was 5 ppm of phenol at a water temperature of 10C. Longer periods were not tested. This concentration produced the typical effects of phenol on activity, which lasted for the 1st 2-3 days. After 1 wk exposure the test fish were still in good condition, as judged from their external appearance. No differences could be demonstrated between the control and phenol-affected groups in blood Hb, hematocrit, total plasma protein, Na+, K+, Ca2+, Mg2+ or Cl- values. The total amount of plasma free amino acids was slightly increased in the phenol-affected group. Significant changes in individual amino acids are reported but their value as indicators of phenol action remains obscure. No clearly destructive histopathological changes in the gill lamellae or liver structures of the phenol-affected group could be detected.--Copyright 1974, Biological Abstracts, Inc.

ACCUMULATION EXPERIMENTS WITH LINDANE IN A CULTURE OF DUNALIELLA FOR STANDARDIZATION OF AN ALGAE TEST. (AKKUMULATIONSVERSUCHE VON LINDEN IN EINER KULTER VON DUNNALIELLA SPEC. ZUR STANDARISIERUNG EINES ALGENTESTES),
Hamburg Univ. (West Germany). Institut fuer Hydrobiologie und Fischereiwissenschaft.
V. K. Lillelund, and L. Wehrmann.
Berichte der Deutschen Wissenschaftlichen Kommission fur Meeresforschung, Vol 23, No 3, p 317-325, 1974. 6 fig, 7 ref.

Descriptors: *Food chains, *Pesticide residues, Pesticides, *Algae, Path of pollutants, Standards, Plankton, Biomass, Water quality standards, Tests, Absorption, Water pollution effects, Pollutant identification.
Identifiers: *Lindane, *Bioaccumulation, *Dunaliella.

Experiments were made with Lindane in a standing water culture of Dunaliella to develop a standard test for the accumulation of pesticides in marine food chains. The degree to which the level of accumulation depends on the pesticide concentration in the culture medium and on the density of cells was determined. (Katz)
W75-03508

TOXICITY OF 2-(DIGERANYLAMINO)-ETHANOL, A CANDIDATE SELECTIVE FISH TOXICANT,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking.
Transactions of the American Fisheries Society, No 4, p 736-742, 1974. 1 fig, 8 tab, 21 ref.

Descriptors: *Toxicants, *Selectivity, *Toxicity, *Bioassay, *Carp, *Temperature, *Fish control agents, Bass, Sunfishes, Laboratory tests, Warmwater fish, Cold-water fish, Hydrogen ion concentration, Hardness(Water), Invertebrates, Salmonids.
Identifiers: 2-(Digeranylamino)-ethanol, Selective toxicants, Micropterus dolomieui, Lepomis macrochirus, Lepomis cyanellus, Carassius auratus.

The chemical, 2-(digeranylamino)-ethanol, was tested in the laboratory and in outdoor plastic pools to determine the toxicity to a variety of cold- and warm-water fish. An interesting aspect is that the toxicant is more toxic to carp than to other warm-water fish. The 96-hr LC50 for carp is 0.0507 mg/liter, whereas that value for centrarchids ranges from 0.237 mg/liter for small mouth bass (Micropterus dolomieui) to 0.720 mg/liter for bluegill (Lepomis macrochirus). The toxicant is significantly less toxic to bluegill in cold water (12C) than in warmer water (17 and 22C), and it is more toxic in hard water than in soft water. Toxicity tests with green sunfish (Lepomis cyanellus) show that the toxicant is significantly more toxic in high pH water (pH = 9.0) than in low pH water (pH = 6.0), and that the toxicant detoxifies at a faster rate in pH 9.0 than in lower pH water. Some aquatic invertebrates are more resistant than fish to the toxicant. The chemical is a good candidate selective toxicant, but additional studies are needed to support a registration for its use. (Katz)

TEMPERATURE EFFECTS ON GROWTH AND RESPIRATION RATES OF DOLANIA AMERICANA (EPHEMEROPTERA),
Du Pont de Nemours (E. I.) and Co., Aiken, S.C. Savannah River Lab.
R. S. Harvey.
Presented at Thirty-fifth Annual Meeting of the Association of Southeastern Biologists, Savannah, Georgia, April 18-20, 1974. 6 p, 7 fig, 4 ref.

Descriptors: Temperature, *Mayflies, *Respiration, *Growth rates, Aquatic insects, Invertebrates, Benthic fauna, Juvenile growth stage, Methodology, Laboratory tests, *Georgia, *Water temperature, Lethal limit.
Identifiers: *Sublethal effects, *Dolania americana, Three Runs Creek(Geo).

Long range studies are being made to determine the effects of nonlethal elevations in water temperature on the ecology of stream organisms. The Mayfly is being studied to determine the effects of seasonal changes in temperature on population growth rates, and the effects of slight elevations in water temperature on the respiration rates of maturing individuals. Growth and respiration rates of the populations increased with temperature until the 2-year - old nymphs emerged in June and July. Throughout the previous year, respiration rates increased with body weight and water temperature. (Katz)
W75-03510

CHRONIC CADMIUM TOXICITY TO THE BLUEGILL (LEPOMIS MACROCHIRUS RAFINESQUE),
National Water Quality Lab., Duluth, Minn.
J. G. Eaton.
Transactions of the American Fisheries Society, No 4, p 729-735, 1974. 1 fig, 4 tab, 11 ref.

Descriptors: *Toxicity, *Lethal limit, Bioassay, *Cadmium, *Sunfishes, Immature growth stage, Juvenile fish, Spawning, Reproduction, Water pollution sources, Metals, Mortality, Spectrophotometry, Analytical techniques, Regression analysis, Hardness(Water), Water pollution effects.
Identifiers: *Bioconcentration, Tissue.

Nine out of 18 adult bluegills exposed for 11 months during a chronic bioassay including reproduction were killed at 80 micrograms/liter of cadmium in water of 200 mg/liter (as CaCO3) hardness. Progeny exposed for 30 days were killed at 90 micrograms/liter. Adult fish spawned at 239 micrograms/liter and at 2,140 micrograms/liter, but most larvae were severely crippled 6 days after hatching at these concentrations. No effects on survival, development, or reproduction were attributable to cadmium at 31 micrograms/liter. The highest tissue residues were found in liver, intestine and caecum, and kidney. Cadmium concentrations increased with exposure concentration in gill liver, and intestine and caecum, but not in kidney. At least until more information is available on cadmium toxicity in different water types, chronically toxic and 'just safe' continuous exposure concentrations probably can be estimated better by relatively short-term exposures of embryos and larvae than by the use of application factors. (Katz)
W75-03511

PHYSIOLOGICAL AND ECOLOGICAL SIGNIFICANCE OF THE CHEMICAL INSTABILITY OF THE URIC ACID AND RELATED PU-

RINES IN SEA WATER AND MARINE ALGAL CULTURE MEDIUM,
Fisheries and Marine Service, Vancouver (British Columbia). Vancouver Lab.
N. J. Antia, and A. F. Landymore.
Journal of the Fisheries Research Board of Canada, Vol 31, No 8, p 1327-1335, August 1974. 3 fig, 3 tab, 26 ref.

Descriptors: *Chemical degradation, *Nitrogen compounds, *Chemical reactions, *Phytoplankton, *Marine microorganisms, *Chemical analysis, Spectrophotometry, Analytical techniques, Water analysis, Hydrogen ion concentration, Nitrogen cycle, Plant growth substances, Methodology, Kinetics, Trace elements, Pollutant identification.
Identifiers: *Uric acid, *Purines.

The chemical instability of uric acid and related purine bases in a seawater phytoplankton culture medium was evaluated spectrophotometrically from concentration changes incurred in aseptic incubation at about 20 C under cool-white light or complete darkness. Uric acid showed slow degradation in darkness, which was increased severalfold by illumination. Xanthine showed a small degree of degradation only from illumination, but adenine, guanine, and hypoxanthine appeared to be stable under both test conditions. The degradation of uric acid was traced to three factors differing in intensity of effect: (1) pH of sea water (minor effect), (2) photolysis (additional minor effect), (3) trace-metal cation content of sea water (major effect), whereas that of xanthine could be traced only to photolysis. These results cast doubt on previous reports of utilization of uric acid as N-source for phototropic growth of marine planktonic algae in that the compound actually utilized may be degradation product(s) rather than the intact purine. Ecologically, the results signify that uric acid could undergo rapid chemical turnover, without biological intervention, in the marine environment. (Katz)
W75-03512

HEAVY METAL TOLERANCE IN TYPHA LATIFOLIA WITHOUT THE EVOLUTION OF TOLERANT RACES,
Syracuse Univ., N.Y. Biological Research Labs.
S. J. McNaughton, T. C. Folsom, T. Lee, F. Park, and C. Price.
Ecology, Vol 55, No 5, p 1163-1165, Late Summer 1974. 3 tab, 15 ref.

Descriptors: *Adaptation, *Ecotypes, *Heavy metals, *Soil contamination effects, Environmental effects, *Zinc, *Cattails, Soils, Environment, Cadmium, Lead, Aquatic plants, Soil analysis, Bioassay, Industrial wastes.
Identifiers: *Typha latifolia.

Clones of the broad-leaved cattail and soil samples were obtained from near a zinc smelter and from a control location. In the smelter location, soil, zinc concentration was 385 times higher, cadmium content 37 times higher and lead content 16 times higher than for the control. No evidence for the evolution of heavy metal tolerant races could be detected in experiments in which genotypes from both locations were grown on both soils. Growth of genotypes from both localities was inhibited on the heavy metal soil, but not to the extent that would be expected from previous studies of heavy metal effects. It is apparent that some peculiarity of the physiology of Typha confers a general resistance to heavy metal tolerance. This may be a cell wall metal precipitation mechanism. (Katz)

PRELIMINARY EXPERIMENTS ON THE EFFECT OF THIODAN AND ENDRIN ON FISH CULTURE IN INDONESIA,
Inland Fisheries Research Inst., Bogor (Indonesia).
A. Hardjamulia, and S. Kusumadinata.
In: Indo-Pacific Fisheries Council Proceedings, 15th Session, Wellington, New Zealand, October 18-27, 1972. Section II: Coastal Aquaculture and Environment, Bangkok, 1974. p 56-64. 10 ref, 5 tab.

Descriptors: *Pesticides, *Aquiculture, *Toxicity, *Endrin, *Fish farming, *Path of pollutants, Fishkill, Environmental effects, Insecticides, Organic pesticides, Bioassay, Lethal limit, Mortality, Pesticide residues.
Identifiers: *Thiodan, Rice fields, Cyrpinus carpio, *Indonesia.

Experiments on the acute lethal effects of Thiodan and Endrin applications to fish in rice fields have been performed. Investigations on the effects of the subsequent movement of Endrin with irrigation water to downstream rice fields has been carried out. A potential hazard of insecticide residue carried by river systems to brackish water and coastal aquaculture areas has also been examined. (Katz)
W75-03515

RECENT DEVELOPMENTS IN THE NEW ZEALAND ROCK OYSTER FARMING INDUSTRY (1970-72) AND PROBLEMS REGARDING AQUATIC POLLUTION,
Ministry of Agriculture and Fisheries, Auckland (New Zealand).
L. Curtin.
In: Indo-Pacific Fisheries Council Proceedings, 15th Session, Wellington, New Zealand, October 18-27, 1972. Section II: Coastal Aquaculture and Environment, Bangkok, 1974. p 51-55. 1 tab.

Descriptors: *Aquiculture, *Oysters, *Shellfish, Farming, *Water quality, *Commercial shellfish, Water pollution, Competing uses, Leases, Recreation, Public health, E. coli, Aquatic animals.
Identifiers: *New Zealand.

Recent developments in the New Zealand rock oyster farming industry are reviewed and problems regarding pollution, leasing of suitable waters and conflicts with recreational uses of coastal areas are considered in relation to the future development of the industry. Lack of prescribed standards for determining the quality of cultured oysters and the resulting interpretations by various concerned agencies of the methods used for this purpose has become a major problem for the industry. A possible change of the present concept of determining oyster quality by examination of the meat to one based on water quality is of serious concern to farmers in view of the high standards set for waters of SA quality. Recommendations for suitable water quality standards, control of coastal pollution and multiple use of coastal areas are given. (Katz)

ENVIRONMENTAL ASPECTS OF FIN EROSION AND TUMORS IN SOUTHERN CALIFORNIA DOVER SOLE,
Southern California Coastal Water Research Project, El Segundo.
A. J. Mearns, and M. Sherwood.
Transactions of the American Fisheries Society, No 4, p 799-810, 1974. 2 tab, 9 fig, 25 ref.

Descriptors: *Fish diseases, *Municipal wastes, *Water pollution effects, Domestic wastes, Waste disposal, *California, Laboratory tests, Environmental effects, Water pollution sources, Industrial wastes, Microscopy, Analytical techniques, Fish behavior.
Identifiers: *Dover sole, Microstomus pacificus, *Fin erosion, Tumors.

Between 1969 and 1972, a number of Dover sole (Microstomus pacificus) with eroded fins and skin tumors were collected in a series of trawls off the coast of southern California. Field and laboratory observations suggest that the two diseases were distinct syndromes operating at different growth stages in the life cycle of the Dover sole. Specimens with fin erosion were concentrated in the vicinity of the major municipal waste-water discharge site in the southern California area. Histological observations showed the disease to be external in nature: The distribution of the diseased fish and the patterns of erosion of the various fins suggest that the disease was brought on by contact with the sediments around the wastewater outfall. Tumor-bearing specimens were more evenly distributed throughout the southern California coastal waters, and the presence of the anomaly appeared to be a function of fish size (usually occurring in specimens of less than 150 mm standard length). The spatial and temporal distributions of tumor-bearing Dover sole suggest that initiation of the disease was not related to wastewater discharges. (Katz)
W75-03517

MERCURY CONTENT OF FISH AND SHRIMPS CAUGHT OFF THE BELGIAN COAST,
Ministere de l'Agriculture, Ostend (Belgium). Sea Fisheries Research Station.
R. De Clerck, R. Vanderstappen, and W. Vyncke.
Ocean Management, Vol 2, No 2, p 117-126, September 1974. 7 fig, 3 tab, 21 ref.

Descriptors: *Mercury, *Shrimps, *Commercial fish, Heavy metals, Coast, Age, Size, Methodology, Regression analysis, Crustaceans, Commercial shellfish, Pollutant identification, Water pollution effects.
Identifiers: Plaice, Cod, Whiting, Tissue analysis, *Belgium.

Mercury was determined in 800 samples of plaice, whiting, cod, sprat, and shrimps caught off the Belgian coast during a one year period. The greater portion of values were situated below 0.250 ppm with the highest frequencies occurring between 0.100 and 0.250 ppm. Significant regressions between length of the fish and mercury content were found for male and female whiting and for male cod only. Neither season nor fishing ground had a significant influence on the mercury content of shrimps. (Katz)

DISSOLVED OXYGEN REQUIREMENTS OF NEWLY-HATCHED LARVAE OF THE STRIPED BLENNY (CHASMODES BOSUIANUS), THE NAKED GOBY (GOBIOSOMA BOSCI), AND THE SKILLETFISH (GOBIESOX STRUMOSUS),
Muskingum Coll., New Concord, Ohio.
V. P. Saksena, and J. B. Edwin.
Chesapeake Science, Vol 13, No 1, p 23-28, March, 1972. 4 tab, 2 fig, 9 ref.

Descriptors: *Dissolved oxygen, *Lethal limit, Estuarine fisheries, *Bioassay, Marine fish, Immature growth stage, *Mortality, Estuarine environment, Water pollution effects.
Identifiers: *TL50, Chasmodes bosquianus, Gobiosoma bosci, Gobiesox strumosus, *Striped blennie, *Skillet fish, *Naked gobies.

Newly hatched larvae of the striped blenny, the naked goby and the skillet fish were exposed for 24 hours to varying concentrations of dissolved oxygen obtained by purging York River water with pre-purified grade nitrogen. The experimental apparatus is described. The striped blennies and the naked gobies had 24 - hour TL50 of 2.50 mg/l and 1.30 mg/l respectively. The TL 50 for skilletfish was not calculated, but apparently lies between 0.72 mg/l and 1.23 mg/l. (Katz)

EFFECT OF NITROGEN SUPERSATURATED WATER ON COHO AND CHINOOK SALMON,
Bureau of Sport Fisheries and Wildlife, Seattle, Wash. Western Fish Disease Lab.
R. R. Rucker, and P. M. Kangas.
The Progressive Fish-Culturist, Vol 36, No 3, p 152-156, July 1974. 6 fig, 9 ref.

Descriptors: *Dissolved oxygen, *Salmonids, Supersaturation, *Chinook salmon, *Nitrogen, *Fry, Juvenile fish, Bioassay, Fish eggs, Gases, Mortality, Water pollution effects, Laboratory tests, Pathology.
Identifiers: *Gas bubble disease, *Coho salmon, Oncorhyncus kisutch, Oncorhynchus tshawytscha.

The eggs and fry of coho and chinook salmon were raised in water with varying levels of supersaturation. Eggs were not found to be affected by concentrations of 128 percent N2 + Ar and O2 in water. Different manifestations of gas bubble disease were observed in coho and chinook fry after 10 and 20 days respectively. These results indicate that air or nitrogen supersaturated waters up to 128 percent saturation do no harm to chinook or coho eggs and that it seems safe to rear the fry for about a week in waters containing this level of saturation. (Katz)

TIDAL AQUARIUM FOR LABORATORY STUDIES OF ENVIRONMENTAL EFFECTS ON MARINE ORGANISMS,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
R. C. Clark, Jr., and J. S. Finley.
The Progressive Fish-Culturist, Vol 36, No 3, p 134-137, July 1974. 2 fig, 1 ref.

Descriptors: *Laboratory tests, *Aquaria, Equipment, Technology, Design, *Marine animals, Bioassay, Methodology, Oil spills, Oil pollution, Water pollution effects, *Environmental effects, Organic compounds.
Identifiers: *Sublethal effects.

A laboratory test chamber for studying the effects of an oil slick on intertidal organisms was developed to determine the uptake of sub-lethal levels of paraffinic hydrocarbons from crude oils and petroleum products by marine organisms. The system consists of four major components - a test and control tank to hold the organism, a siphon assembly, a pump assembly and an aeration system. The components are described in detail and operation is explained. (Katz)

THE TOXICITY OF TNT AND RELATED WASTES TO AN AQUATIC FLOWERING PLANT, LEMNA PERPUSILLA,
Edgewood Arsenal, Aberdeen Proving Ground, Md.
C. D. Schott, and E. C. Worthley.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-778 158, $3.25 in paper copy, $2.25 in microfiche. Edgewood Arsenal Technical Report EB-TR-74016, April 1974. 18 p, 2 tab, 2 fig, 2 ref.

Descriptors: *Phytotoxicity, *Industrial wastes, *Toxicity, *Phytoplankton, *Water pollution effects, Water pollution sources, Growth rate, Herbicides, Bioassay, Hydrogen ion concentration, Flowering.
Identifiers: *Lemna perpusilla, *TNT.

Some products of TNT manufacture, and one transformation product, 4-amino-2 nitrotoluene were assessed for phytotoxicity in order to determine if TNT wastes are potentially hazardous. The herbicide 2,4-dichlorophenoxyacetic acid was used as the positive control for comparative purposes. 2,4-Dichlorophenoxyacetic acid depressed colony growth of Lemna perpusilla at a concentration of 0.1 ppm, whereas 2,4 dinitrotoluene depressed colony growth at a concentration of 0.5 ppm. At pH 6.3, the highest no-effect concentration range for each compound is: 2,4-dichlorophenoxyacetic acid, 0.01 to 0.1 ppm; 2,4-dinitrotoluene, 0.1 to 0.5 ppm; 2,4,6 trinitrotoluene, 0.5 to 1.0 ppm; 4-amino-2-nitrotoluene, 10 to 50 ppm; and 0-nitrotoluene, 10 to 100 ppm. INVESTIGATIONS ON AEROBIC PECTOLYTIC BACTERIA IN AN EUTROPHIC LAKE, (IN GERMAN),
Freiburg Univ. (West Germany). Limnologisches Institut.
H. Guede.
Arch Hydrobiol Supplementb, Vol 42, No 3/4, p 483-496, 1973, English summary.
Identifiers: *Aerobic bacteria, Bacteria, *Cytophaga, Epilimnion, *Eutrophication, Lakes, Pectolytic bacteria, Strain, Yeast extract, *West Germany(Constance), Water pollution effects.

For a period of 7 mo. the aerobic pectolytic bacteria of a eutrophic lake near Constance (West Germany) were counted on pectate gel plates. Most of the pectolytic bacteria were found in the epilimnion. Bacteria of the genus Cytophaga were the most frequent pectin decomposers. In experiments with an isolated strain of that genus it could be shown that pectin degradation by these bacteria was reversibly repressed by yeast extract.--Copyright 1974, Biological Abstracts, Inc.

RENAL CONCENTRATION OF CITRATE AS A NEGATIVE MODULATOR OF DIURETIC RESPONSE TO MERCURIALS,
Medical Coll. of Ohio, Toledo. Dept. of Pharmacology and Therapeutics.
V. Nigrovic, and E. J. Cafruny.
Nature, Vol 247, No 5440, p 381-383, February 1974. 2 tab, 11 ref.

Descriptors: *Mercury, *Animal physiology, Mammals, Organic compounds, Laboratory tests, Laboratory animals, Chemical reactions, Transfer.

The hypothesis that alkalosis increases and acidosis decreases the renal concentrations of an endogenous metabolite which is capable of complexing mercury was tested. In the kidneys the partition of mercuric ions between the diuretic receptor and the hypothetical ligand would then depend on the relative affinity for mercury. To test the hypothesis, conditions were chosen which would alter the renal concentration of citrate with or without inducing concomitant changes in acid-base status. Two series of experiments were performed on anesthetised dogs of either sex. The first series of experiments was intended to determine whether the citrate concentration in the kidneys is altered in the desired direction in dogs infused with hydrochloric acid or sodium hydroxide for 2 hours, or injected with sodium fluoroacetate. In the second series, the dogs were treated as in thefirst series. At the end of the 2 hour pretreatment period, mercury-cysteine complex was injected intravenously. There was a slight decrease in the glomerular filtration rate in dogs pretreated with acid alone and a larger decrease in acidotic dogs treated with uranyl benzoate, in alkalotic dogs, and in fluoroacetate pretreated dogs. The results were in agreement with and furnished experimental support for the hypothesis. (Jernigan-Vanderbilt)

SELENIUM BIOCHEMISTRY,
National Heart and Lung Inst., Bethesda, Md.
T. C. Stadtman.
Science, Vol 183, No 4128, p 915-922, March, 1974. 2 tab, 78 ref.

Descriptors: *Biochemistry, *Enzymes, *Animal metabolism, Oxidation, Reduction(Chemical), Metals, Nutrition, Reviews.
Identifiers: *Selenium.

The biochemical characteristics of selenium were discussed. Proteins containing selenium are essential components of certain bacterial and mammalian enzyme systems. Only three enzyme-catalyzed reactions have been shown to require the participation of a selenium-containing protein. These are the reactions catalyzed by (1) formate dehydrogenase of bacteria (2) glycine reductase of clostrida, and (3) glutathione peroxidase of erythrocytes. They are all oxidation-reduction reactions. The form in which selenium occurs in these selenoproteins is unknown. Identification of the chemical nature of selenium in proteins participating in electron transport processes should enable us to determine selenium's specific role and to understand the basic defects in certain cardiac and skeletal muscle degenerative diseases which are selenium-deficiency syndromes. (Jernigan-Vanderbilt)

MERCURY IN TUNAS: A REVIEW,
Inter-American Tropical Tuna Commission, LaJolla, Calif.
C. L. Peterson, W. L. Klawe, and G. D. Sharp.
Fishery Bulletin, Vol 71, No 3, p 603-613, July, 1973. 1 fig, 2 tab, 35 ref.

Descriptors: *Mercury, Fish, *Tuna, Food, *Distribution patterns, Aquatic life, Oceans, Organic compounds, Food chains, Public health, Toxicity, Human pathology, Sea water, Variability, *Reviews.
Identifiers: *Methylmercury.

Mercury in the aquatic environment comes from both natural processes and industrial activities. The latter probably have not significantly altered the mercury content of the high seas where most tunas are captured. Mercury compounds enter

aquatic organisms through the food web and/or by direct extraction from solution. The relative importance of these pathways in tunas is unknown. Mercury occurs in tuna principally in the form of methylmercury. Generally, tunas appear to have higher mercury levels than those fish species which occupy a lower level in the food chain. Mercury content of tunas varies according to fish size. However, other factors such as area of capture, differential growth rates, varying analytical techniques, and different sampling methods may account for some of the observed variation. The U.S. Food and Drug Administration has established an in-house standard of 0.5 ppm of mercury for fishery products sold in the United States. Other countries have established limits as high as 1.0 ppm. (Jernigan-Vanderbilt)

OBSERVATIONS ON THE ECOLOGY OF LACRUSTRINE POPULATIONS OF THE THREESPINE STICKLEBACK (GASTEROSTEUS ACULEATUS L., 1758) IN THE MATAMEK RIVER SYSTEM, QUEBEC,
Ottawa Univ. (Ontario). Dept. of Biology.
Brian W. Coad, and G. Power.
Nat Can (Que) Vol 100, No 5, p 437-445, 1973.
Identifiers: Brooks, *Canada(Matamek River), *Ecology, Feeding, Gastrosteus-aculeatus, Growth, Insects, *Lacustrine populations, Plankton, Quebec, Rivers, Schistocephalus-solidus, Spawning, *Three-spined stickleback, Trout, Zooplankton.

Lacrustrine populations of the threespine stickleback in the Matamek River System, Quebec (Canada), were studied during 1970-1971. Examination of otoliths and length-frequency histograms showed three age groups to be present. Growth was slower in the lake populations compared to a marine population. Spawning occurred in July of the 3rd year of life but females parasitized with plerocercoids of Schistocephalus solidus did not breed. The mean number of parasites/fish was 1.93 for the 1 + age group and 2.97 for the 2 + age group and infestation levels often approached 100%. Mean number of eggs was 88 and mean diameter was 1.56 mm. The diet of young sticklebacks was chiefly zooplankton while larger sticklebacks also fed on drift insects in competition with brook trout.--Copyright 1974, Biological Abstracts, Inc.

AGRICULTURE'S POLLUTION SOLUTION FOR LAKE APOPKA,
C. Woods.
In: Sunshine State Agricultural Research Report for September-October, 1973, p 8-11. (1973). 4 illus.

Descriptors: *Water pollution sources, *Eutrophication, *Water pollution control, *Agricultural runoff, *Drainage engineering, Water pollution, Pollution abatement, Phosphates, Nitrates, Nutrients, Water management(Applied), Recreation, Lakes, Impoundments, Farm ponds, Impounded waters, Agriculture, Data collections, Waste treatment.

After years of controversy over who is responsible for the pollution of Lake Apopka in Florida, a concerted effort is now being made to restore the lake so it can again be used for fishing and recreation. During the past 25 years a steady infusion of nutrients, particularly phosphates and nitrates, has caused the lake to become highly eutrophic. The major sources of these nutrients have been effluents from municipal sewage, drainage from muck farms, wastes from citrus processing plants, decaying hydrophytes and aquatic animals. Of all pollution control efforts now underway, the most ambitious involves 33 farmers around the northeast shore of Lake Apopka. Their objective is to retain their nutrient-rich irrigation water in holding ponds instead of pumping it back into Lake Apopka. Data obtained from the project will be used to develop an abatement system for polluted drainage water from organic soils. The system is expected to serve as a model for similar pollution control systems elsewhere in the United States. (Ritchie-Florida)

CHRONIC FLUORIDE INTOXICATION FROM DRINKING WATER: PRELIMINARY REPORT,
H. T. Petraborg.
Fluoride, Vol 7, No 1, p 47-52, 1974.
Identifiers: Chronic toxicity, Fluorides, Gastrointestinal symptoms, Human diseases, Neurological symptoms, *Wisconsin(Milwaukee), Polydipsia, *Toxicity, *Potable water, Water pollution effects.

Seven individuals in the Milwaukee, Wisconsin, area presented a history of intolerance to fluoridated water. They experienced mainly gastrointestinal and neurological symptoms, polydipsia and increasingly severe general disability. This progressive disease began when they moved into a fluoridated city or shortly after fluoride was added to the water supply to their community. It cleared up promptly when they moved their residence to nonfluoridated communities or upon substituting spring water with little or no fluoride. During their illness they had not been aware that their water supply was fluoridated.--Copyright 1974, Biological Abstracts, Inc.

ALGAL NUTRIENT LIMITATION IN LAKE ONTARIO AND TRIBUTARY WATERS,
Wisconsin Univ., Madison. Dept. of Civil Engineering.
N. Sridharan, and G. F. Lee.
Preprint (1974). 35 p, 10 fig, 5 tab, 1 ref. EPA R 800537.

Descriptors: *Algae, *Nutrients, *Lake Ontario, Limiting factors, Tributaries, Plankton, Analytical techniques, Phosphorus, Nitrogen, Bioassay, Eutrophication, Nutrient removal.
Identifiers: Selenastrum capricornutum.

In nutrient-spiking studies of Lake Ontario and its tributary rivers of Niagara, Black, Genesee, and Oswego waters both nitrogen and phosphorus were required for stimulation of cultured and 'natural' algae growth. Samples of the Genesee and Oswego Rivers generally showed nitrogen stimulation. Also, many of the samples from these rivers demonstrated stimulation due to the addition of micronutrients; however care must be exercised in interpreting micronutrient stimulation as the micronutrient solution contained EDTA, a strong complexing agent, which can eliminate toxic elements in the water. Essentially all lake water samples showed phosphorus limitation. It is possible that phosphorus removal at domestic wastewater treatment plants located in these areas could be sufficient to cause phosphorus to be limiting. It is also possible that advanced waste treatment could reduce the concentration of the apparent toxicants in these rivers which would stimulate algae growth in the rivers and nearshore lake waters due to excess of phosphorus present. Even though the potential impact of phosphorus removal cannot be predicted for these rivers and nearshore Lake Ontario waters, it is clear that such a practice will be of some benefit in reducing and possibly reversing the excessive eutrophication trend. (Auen-Wisconsin)

NITROGEN BUDGETS OF GREAT PLAINS IMPOUNDMENTS,
Oklahoma State Univ., Stillwater. Dept. of Zoology.
D. W. Toetz.
In: Man Made Lakes: Their Problems and Environmental Effects, American Geophysical Union, Washington, D.C. 1973, p 567-571. (Geophysical Monograph Series Vol 17). OWRT A-023-OKLA(3).

Descriptors: *Nitrogen, *Impoundments, *Great Plains, Cycling, Reservoirs, Influent streams, Precipitation(Atmospheric), Groundwater, Nitrogen fixation, Nitrates, Runoff, Cyanophyta, Benthos, Sediments, Aquatic plants, Denitrification, Eutrophication.
Identifiers: *Nitrogen sources.

Nitrogen in a biologically unstable form can enter a lake in influents, as precipitation, or as gas on the surface, in groundwater, and by biological nitrogen fixation. Data on mean discharge and nitrate in 109 streams in the United States indicate that a close relationship exists between stream runoff and nitrate load on an areal basis. Seasonal variation can be expected. Groundwater may be an important source of N for certain reservoirs. Ammonia can be volatilized from feedlot operations and enter lakes from the atmosphere. Biological nitrogen fixation by certain algae, bacteria, and fungi may cause increases. Nitrogen losses from outlets of impoundments are probably more important in reservoirs than in natural lakes because of the higher rate of water exchange in reservoirs. Less is known of other losses: sediments as a sink, fish catch, aquatic macrophyte removal, and groundwater recharge. Denitrification prepresents an important nitrogen sink. Nitrate in density currents in the anoxichypolimnion of some reservoirs can be converted rapidly to nitrogen. Use of detritus and assimilation of dissolved organic matter by microbes may be more significant than algal production as a production process. (Jones-Wisconsin)

A CRITICAL REVIEW OF VOLLENWEIDER'S NUTRIENT BUDGET MODEL AND OTHER RELATED MODELS,
Ministry of the Environment, Rexdale (Ontario). Limnology and Toxicity Branch.
P. J. Dillon.
Water Resources Bulletin, Vol 10, No 5, p 969-989, 1974. 2 tab, 13 ref.

Descriptors: *Nutrients, *Mathematical models, *Reviews, Stratification, Sedimentation, Eutrophication.
Identifiers: *Nutrient budget, *Vollenweider's model, Flushing, *(Arch. Hydrobiol. 66:1-36, 1969).

Early attempts at nutrient budget modeling considered only the case where there was no loss of the material by sedimentation, i.e., the substance was assumed to be conservative. Nonstratified and stratified conditions have both been investigated under these terms. An elegant model, taking into account loss of a substance by sedimentation as well as flushing was presented by Vollenweider. Four important assumptions are inherent in the simple version of that model: the supply J (or loading L) is assumed to be constant through time, as are the flushing and sedimentation rates; the sedimentation process is treated as a first-order chemical process dependent only on the amount of material in the lake (and as a further consideration, dependent on the loading as well); stratification (and other non-uniform mixing features) is ignored, resulting in an unrealistic flushing rate; the concentration of a substance in the outflow is equated to the mean concentration in the lake. Although this model has several shortcomings, it is particularly valuable because it can have immediate practical value in terms of water management policy development. The basic shorcomings in the model are analyzed and suppestions are made to alter the model to take these factors into account. (Jones-Wisconsin)

OIL ON THE SEA.
Massachusetts Inst. of Tech., Cambridge.; and Woods Hole Oceanographic Institution, Mass.
Symposium proceedings 'Scientific and Engineering Aspects of Oil Pollution of the Sea' May 16, 1969, Cambridge, Mass. Plenum Press, New York, 1969. 114 p.

Descriptors: *Technology, *Oil pollution, *Oceans, *Water pollution control, Oil spills, Detergents, Toxicity, Marine plants, Marine animals, Environmental effects, Dispersion, Analysis, Separation techniques, Transportation, Oil industry, Oil wells, Burning, Emulsions, Surfactants, Federal government, Judicial decisions, International waters, Legal aspects, Jurisdiction.
Identifiers: *Oil slicks, Santa Barbara(Calif), Torrey Canyon, Tankers.

The current understanding of oil pollution of the seas relative to oil composition and its biological effects, oil analysis, law enforcement, long-term effects of oil pollution, countermeasures against large oil spills, and the long-term outlook are discussed. The effects and control efforts following the 'Torrey Canyon' and the Santa Barbara oil spills are detailed. The role of chemical dispersants in connection with the behavior of oil spills, its detrimental effects and the basis for dispersing, tests of dispersants' relative effectiveness, toxicity, and some practical field applications are included. Regarding oil slick spread on a calm sea, physical considerations, rate of spread, spread from a steady source in a moving stream, are all compared with field observations. The main engineering features of physical and pneumatic booms operating as oil containment devices in the open sea are discussed. The effectiveness of removal of oil slicks by controlled combustion using CAB-0-SIL ST-2-0 is compared. The role of the federal government in oil pollution has taken the form of congressional and administrative action, judicial interpretations, and participation in international treaties and conventions. (Jones-Wisconsin)

THE MICROFLORA IN THE SETTLING AND SUBSOIL WATER ENRICHING BASINS OF THE BUDAPEST WATERWORKS,
University of Agriculture, Godollo (Hungary).
T. Hortobagyi.
Akademiai Kiado, Budapest, 1973. 341 p.

Descriptors: *Water works, *Microorganisms, *Systematics, Trophic level, Settling basins, Oligotrophy, Eutrophication, Chlorophyta, Cyanophyta, Water purification, Filtration, Infiltration, Subsurface water, Ecosystems, Phytoplankton, Algae, Bacteria, Diatoms.
Identifiers: *Budapest(Hungary), *River Danube, Bacillariophyceae, Conjugatophyceae.

The settling and subsoil infiltration basins of the Budapest Waterworks limnologically belong to the River Danube. On several occasions differences were observed between the actual trophity and trophic type of the basins. Rich and variegated photocoenoses may alternate with poorly populated oligotrophic conditions. The discolorations of the water as well as the formation of water blooms indicate a greater degree of pollution in the river. There is a significant rise both in the number of taxa and individuals proceeding from the River Danube through the settling basins reaching the highest peak in the southwestern corner of the infiltration basin. In the formation of the phytocoenoses certain algal phyla participate in various degrees both in time and space. The water of the basins is betamesosaprobiont in character; it is more pronounced in the infiltration basin. Species with the greatest number of individuals were Planctomyces Bekefii. Merismopedia tenuissima, Microcystis spp., Stephanodiscus Hantzchii, Cryptomonas erosa, Hyaloraphidium contortum var. tenuissimum, Lambertia Judai, Micractinium pussillum, and Scenedesmus spp. Of the organisms identified, the highest number of taxa (266) belong to the order Chlorococcales of the phylum Chlorophyta. The other significant group is Bacillariophyceae with 39 taxa, Cyanophyta 33, and Conjugatophyceae 22. (Jones-Wisconsin)
W75-03763

PRIMARY PRODUCTION IN RELATION TO TEMPERATURE STRUCTURE, BIOMASS CONCENTRATION, AND LIGHT CONDITIONS AT AN INSHORE AND OFFSHORE STATION IN LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
P. Stadelmann, J. E. Moore, and E. Pickett.
Journal Fisheries Research Board of Canada, Vol 31, No 7, p 1215-1232, 1974. 12 fig, 5 tab, 20 ref.

Descriptors: *Primary productivity, *Temperature, *Biomass, *Light, *Lake Ontario, Photosynthesis, Seasonal, Mixing, Carbon, Nitrogen, Chlorophyll, Light intensity, Stratification, Deep water, Shallow water, Spatial distribution, Temporal distribution.

The vertical and diel variation in primary production at an inshore (60 m) and an offshore station (180 m) were studied using in situ C-14 experiments and this data related to light, biomass, and temperature. During the first week the two stations were investigated to obtain a single profile of physical and biochemical data. The following week, each station was occupied for 48 h and during this period primary production measurements were conducted. A lag in increase of both biomass and photosynthesis rate at the offshore station in early summer was attributed to deep vertical mixing. Production/biomass quotients were computed using different biomass parameters such as particulate organic carbon, nitrogen, and chlorophyll-a. Carbon turnover rates of the seston on an areal basis (sq m) were found to vary between 0.04-0.18 per day and 0.01-0.21 per day at the inshore and offshore station, respectively. Daily photosynthesis efficiency (energy fixed by photosynthesis/available energy) ranged from 0.1 to 1.8% at both stations. Atypical photosynthesis-light intensity curves showed that algal populations behaved differently at different depths during the stratified period. (Jones-Wisconsin)
W75-03764

NUTRIENT UPTAKE KINETICS IN PHYTOPLANKTON: A BASIS FOR NICHE SEPARATION,
State Univ. of New York, Albany. Dept. of Biological Sciences.
R. G. Stross, and S. M. Pemrick.
Journal of phycology, Vol 10, No 2, p 164-169, 1974. 4 fig, 1 tab, 28 ref. NSF GV 29347.

Descriptors: *Nutrients, *Absorption, *Kinetics, *Phytoplankton, *Niches, Photosynthesis, Phosphates, *New York, Diurnal, Diatoms, Biorhythms, Temporal distribution.
Identifiers: *Lake George(NY), Asterionella, Tabellaria, Fragilaria.

Phytoplankton photosynthetic rhythms have long been observed and the total response may result from the expression of an intrinsic rhythmicity in the photosynthetic capacity of a least one major component. Daily patters of incorporation of carbon dioxide and inorganic phosphates were measured in phytoplankton from Lake George. Photosynthesis rates oscillated in phase for the entire assemblage and for individual cells of Asterionella, Tabellaria, and Fragilaria. The photosynthetic capacity was maximal in early afternoon. Daily patterns of phosphate uptake were also rhythmic. At ambient concentrations the assemblage takes up phosphate maximally in the morning while individual cells of the large diatom take it up maximally in the evening. A kinetic analysis of phosphate uptake indicated two uptake velocities for Tabellaria and Frafilaria cells: a hyperbolic function at small and an apparently linear relationship at relatively large concentrations. The large diatoms, in contrast to the total assemblage, functioned maximally at two separate times of the day: in the evening at ambient levels and in the morning at 0.4 micromoles and larger concentrations. Temporal stratification of the nutrient niche may be achieved by several uptake mechanisms in the algal cell functioning at different times of day or with a variable uptake velocity. (Jones-Wisconsin)

NITROGEN AND PHOSPHORUS AVAILABILITY IN LAKE ONTARIO TRIBUTARY WATERS DURING IFYGL,
Texas Univ., Dallas. Inst. for Environmental Sciences.
W. F. Cowen, K. Sirisinha, and G. F. Lee.
Preprint (1974). 33 p, 1 fig, 10 tab, 18 ref. EPA R-800537.

Descriptors: *Measurement, *Nitrogen compounds, *Phosphorus compounds, *Lake Ontario, Tributaries, Algae, Nutrients, Limiting factors, Water pollution sources, Analytical techniques, Bioassay, *New York.
Identifiers: Niagara River(NY), Genesee River(NY), Oswego River(NY), Black River(NY).

What forms of N and P should be measured and how much of the non-readily available N and P

should be considered as potentially available to algae are discussed. It is recommended that the available phosphorus be computed by adding the soluble orthophosphorus to 20% of total phosphorus minus the soluble orthophosphate. The 20% figure is highly variable, and properly the value should be 20 plus or minus 20. Total P should not be used for tributary sources since a substantial part of the P associated with particulate matter will not become available in the lake. One of several procedures for nitrogen analysis as a nutrient source is to measure soluble ammonia and nitrate. The total Kjeldahl N should be made on the samples and the available nitrogen computed by summing ammonia-nitrogen, nitrate-nitrogen and 0.5 total Kjeldahl N minus ammonia nitrogen. It is also important to assess weather N and P are limiting or can be made limiting as there is little need of measuring P transport if it can be domonstrated that N is the limiting element, unless the P input can be reduced to cause it to become limiting. The recommended procedures for computing estimated nutrient load is subject to considerable variation. (Auen-Wisconsin)

COMPARATIVE STUDIES OF THE TOXICITY OF HEAVY METALS TO PHYTOPLANKTON AND THEIR SYNERGISTIC INTERACTIONS,
Toronto Univ. (Ontario). Dept. of Botany.
T. C. Hutchinson.
In: Water Pollution Research in Canada 1973, Vol 8, p 68-90, 15 fig, 1 tab, 9 ref.

Descriptors: *Toxicity, *Heavy metals, *Phytoplankton, Cadmium, Copper, Cobalt, Lead, Mercury, Nickel, Algae, Pollutants, Plant growth, Chlorella, Scenedesmus, Chlamydomonas, Zinc, Bioassay, Indicators, Resistance.
Identifiers: *Synergistic effects, Silver, Selenium, Barium, Haematococcus, Antagonistic effects.

Which metals are toxic to phytoplankton and at what levels was investigated. Four unicellular green algae species were used for bioassay under laboratory conditions. Cadmium, copper, cobalt, lead, mercury, silver, selenium, barium, and nickel were tested for toxicity to these algae in nutrient solutions designed to support algal growth. Growth and cell division were used as a simple assay of metal toxicity under a range of concentrations for each metal. To determine effects of specific metal interactions, studies using metals in test pairs are described. They provide examples of synergism and antagonism between metals with respect to toxicity. Toxicity of these metals in solution to the algae had wide diversity. Marked differences between algae, with an almost a unique response to each metal, was revealed. Several metals were inhibitory to some species at 0.1 ppm or less. Silver inhibited Chlorella growth at 0.005 ppm. Most algae showed progressive decrease in growth with increasing metal concentration. Chlorella was the most sensitive to cadmium, copper, mercury, selenium and silver. Copper and nickel were found to act synergistically, each enhancing the other's toxicity. Selenium reduced the toxicity of cadmium thus showing metal antagonism. HEAVY METAL TOLERANCE IN ALGAE ISOLATED FROM POLLUTED LAKES NEAR THE SUDBURY, ONTARIO SMELTERS,
Toronto Univ. (Ontario). Dept. of Botany.
P. M. Stokes, T. C. Hutchinson, and K. Krauter.
In: Water Pollution Research in Canada 1973, Vol 8, p 178-201. 14 fig, 4 tab, 5 ref.

Descriptors: *Algae, *Heavy metals, *Resistance, Nickel, Copper, Lethal limit, Absorption, Cytological studies, Water pollution effects.
Identifiers: *Multiple metal tolerance, Sudbury(Ontario), Silver.

Algal isolates obtained from lakes in the Sudbury, Ontario district containing high levels of heavy metals, including nickel up to 3 ppm and 0.7 ppm of copper in solution were found to be tolerant to higher levels of toxic metals than were laboratory strains. Their growth response to metals in the medium is distinctive and different from that of the laboratory strains of Scenedesmus and Chlorella, which stop growing at 0.1 ppm Cu and 0.5 ppm Ni. Lake strains continued to grow up to 1.0 ppm Cu and 3.0 ppm Ni, and stop growing at 0.4 ppm Cu. Both lake isolates showed a gradually decreasing growth rate with increasing concentrations of metals whereas the laboratory strains were totally inhibited at low metal concentrations, suggesting a mechanism of metal tolerance. The ecological implications of these adaptations to high levels of toxic metals are discussed, especially the finding that the tolerant algae are adapted to high silver levels, even though silver is not a pollutant in the lakes. The ability of these algae to survive in normally toxic solutions of copper is due to their ability to accumulate it in large amounts and to continue cell division and growth. LIMNOLOGICAL STUDIES ON THE RIVER YAMUNA AT DELHI, INDIA. PART II. THE DYNAMICS OF POTAMOPLANKTON POPULATIONS IN THE RIVER YAMUNA,
Max-Planck-Institut fuer Limnologie zu Ploen (West Germany). Dept. of Tropical Ecology.
H. Rai.
Archiv fur Hydrobiologie, Vol 73, No 4, p 402-517, 1974. 1 fig, 7 tab, 22 ref.

Descriptors: *Biological communities, *Plankton, *Rivers, Phytoplankton, Zooplankton, Diatoms, Cyanophyta, Protozoa, Rotifers, Turbidity, Light penetration, Water temperature, Nitrates, Phosphates, Oxygen, Chlorophyta, Crustaceans, Euglenophyta, Copepods, Bioindicators, Water pollution sources, Insects, Oligochaetes, Annelids.
Identifiers: *River Yamuna(India), *Potamoplankton, Xanthophyceae, Ostracods, Delhi(India), Bacillariophyceae.

From February 1958 through January 1960 the Yamuna River at Delhi, India supported an abundant and diverse potamoplankton consisting of 124 genera or species of phytoplankton and 97 genera or species of zooplankton. Rotifera represented the most abundant major zooplankton group, although the Protozoa was the dominant generic group at polluted stations. The Bacillariophyceae composed by far the dominant portion of the total annual phytoplankton. The Chlorophyceae and Cyanophyceae were second and third, respectively, in relative abundance, while the pigmented flagellates formed only a small fraction of the total phytoplankton. There is a definite increase in the Cyanophyceae among the phytoplankton and in the Protozoa and Rotifera among zooplankton, in the most polluted stations. An increase in number of some entire organism groups can be used as an indicator of sanitary conditions. The nitrate and albuminoid-N concentration and seemingly the phosphate concentration were increasingly related to phytoplankton yield; soluble silica apparently maintained almost equal concentration. This study suggests that River Yamuna did not develop especially distinctive potamoplankton, but that most organisms were introduced by sewage outfalls. The greater concentrations below the sources of pollution were qualitatively characteristic of the nearest upstream sewage outfall. (Jones-Wisconsin)

A CHECK LIST OF THE BIOTA OF LOWER CHESAPEAKE BAY,
Virginia Inst. of Marine Sciences, Gloucester Point.
M. L. Wass.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-223 655, $8.75 in paper copy, $2.25 in microfiche. Special Scientific Report No 65, October 1972. 290 p, 804 ref.

Descriptors: *Ecological distribution, *Biota, *Chesapeake Bay, *Estuaries, *Varieties, Algae, Fungi, Wetlands, Dunes, Protozoa, Plants, Vectors(Biological), Bacteria, Invertebrates, Fish, Maryland, *Virginia, Reptiles, Birds, Mammals, Barrier islands, Waterfowl, Salinity, Sediments, Hosts, Mollusks.

This ecologically-annotated checklist will help evaluate the current status of the biota of lower Chesapeake Bay and provides a baseline against which future developmental projects and research activities can be judged. Included are lower plants, wetland and dune plants, protozoa, disease organisms and parasites, free-living invertebrates, fishes of Chesapeake Bay and the adjacent coastal plain, herptiles of Maryland and Virginia coastal plain, birds dependent on open water or wetlands, and mammals of water, wetlands, and barrier islands. The list is divided into chapters which can be issued separately for specific interests. Each chapter has an index and one or more reference lists. Common names are provided for some higher plants and all vertebrates. Salinity categories are those of the 'Venice system.' Sediment preferences for invertebrates are generalizations. Chesapeake Bay is the largest estuary in North America, subjected to broad ranges of temperature, wind, turbulence, and dissolved oxygen. Salinities range from rather constant at the mouth to an ecotone. Organisms range from specialists, largely biologically controlled by predation and competition, near the mouth, to generalists, or fugitive species, accommodating to physical factors in upper reaches. Diversity is high in the lower bay. (Jones-Wisconsin)

MARINE FLORA AND FAUNA OF THE NORTHEASTERN UNITED STATES. PROTOZOA: CILIOPHORA,
New Hampshire Univ., Durham. Dept. of Zoology.
A. C. Borror.
For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC 20402, Price $0.65. NOAA Technical Report NMFS CIRC-378, September 1973. 62 p, 97 fig, 102 ref.

Descriptors: *Marine animals, *New England, *Protozoa, Coasts, Estuaries, Systematics, *Bibliographies.
Identifiers: *Ciliophora.

There is an urgent need for more precise and complete identification of coastal organisms than has been available. It is mandatory, wherever possible, that organisms be identified accurately to species. Accurate scientific names unlock the great quantities of biological information stored in libraries, obviate duplication of research already done, and make possible prediction of attributes of organisms that have been inadequately studied. This manual includes an introduction on the general biology, an illustrated key, an annotated systematic list, a selected bibliography, and an index to the marine ciliated Protozoa of coastal

and estuarine waters of New England. The key facilitates identification to family of nonencysted, nondividing marine ciliates at any stage in the life cycle. It is intended for use by a broad audience, hence is artificial (order not necessarily parallel to phylogenetic sequence), and is stripped of unnecessary technical terms. Within the Ciliophora there is wide variation in the arrangement of the cilia, and this forms the basis for classification. A glossary with figures gives the terms used in the key to describe the anatomy of marine ciliates. Collection, examination, and identification techniques are described. (Jones-Wisconsin)

BEHAVIORAL ALTERATIONS IN A SIMPLE PREDATOR-PREY SYSTEM DUE TO SUBLETHAL EXPOSURE TO MERCURY,
Savannah River Ecology Lab., Aiken, S.C.
H. J. Kania, and J. O'Hara.
Transactions of the American Fisheries Society, Vol 103, No 1, p 134-136, January 1974. 1 fig, 1 tab, 7 ref.

Descriptors: *Mercury, *Fish, *Fish behavior, *Laboratory tests, Toxicity, Ecology, Testing procedures, Analytical methods, Lethal limit, Water pollution effects.
Identifiers: *Sublethal effects.

The effects of sublethal concentrations of mercury on a simple predator-prey relationship were investigated. The present work examined the direct ecological ramifications of behavioral alterations caused by stress. After a 24 hour exposure to sublethal mercury concentrations of 0.1, 0.05 and 0.01 ppm Hg(++), the ability of mosquitofish to avoid predation by bass was impaired. Fish exposed to 0.005 ppm Hg(++) were not affected. The degree of effect showed positive correlation with mercury concentrations. (Jernigan-Vanderbilt)
W75-03788

EFFECT OF POTASSIUM AND ZINC IONS OF GROWTH AND TRYPTOPHAN SYNTHETASE IN ALKALOID PRODUCING CULTURE OF ASPERGILLUS FUMIGATUS,
Maharaja Sayajirao Univ. of Baroda (India). Dept. of Microbiology.
K. K. Rao, and A. R. Gupta.
Current Science, Vol 43, No 13, p 415-416, July 5, 1974. 1 tab, 9 ref.

Descriptors: *Zinc, *Microbiology, *Nutrient requirements, Metals, Growth rates, Mineral needs, Potassium.
Identifiers: *Aspergillus fumigatus.

Potassium and zinc stimulate alkaloid formation by supplying more tryptophan through increased activity of tryptophan synthetase. The results of the analysis showed that the omission of K and Zn from the culture medium caused a decrease in both growth and alkaloid production. Alkaloid production was maximum (112 mg/l) when the K content of the medium was 200 mg/l, where there was four times more free endogenous tryptophan available to the culture due to the four fold increased activity of tryptophan synthetase. Similarly 0.75 mg Zn per l gave 110 mg of alkaloids, where again the increase in alkaloid yield may have been due to the availability of more tryptophan in comparison to control. The results clearly indicate that either absence or limited concentration of K and Zn decrease the synthesis of tryptophan ultimately reducing the yield of alkaloids. (Pulliam-Vanderbilt)

EPIDEMIOLOGICAL SURVEY OF WORKERS EXPOSED TO CADMIUM, EFFECT ON LUNG, KIDNEY, AND SEVERAL BIOLOGICAL INDICES,
Louvain Univ. (Belgium).
R. R. Lauwerys, J. P. Buchet, H. A. Roels, J. Brouwers, and D. Stanescu.
Archives of Environmental Health, Vol 28, No 3, p 145-148, March 1974. 1 fig, 4 tab, 22 ref.

Descriptors: *Cadmium, *Public health, *Human pathology, *Human physiology, Testing procedures, Toxicity, Proteins, Analytical techniques, Spectroscopy.

Pulmonary ventilatory function and various biological indices have been investigated in three groups of workers exposed to cadmium dust (women with less than 20 years exposure (E1), men with less than 20 years' exposure (E2), and men with more than 20 years' exposure (E3) and in three matched control groups. The current airborne Cd dust concentration in the workrooms was below the actual American threshold limit value (200 micrograms/cu m). A slight but significant reduction in forced vital capacity, in forced expiratory volume in one second, and in peak expiratory flow rate was found in E3 workers. Kidney damage was more prevalent than pulmonary ventilatory changes, since excessive proteinuria was observed in 15% of E2 workers and in 68% of E3 workers. The electrophoretic pattern of the urinary proteins suggests that the lesion is first glomerular and later becomes predominantly tubular (mixed proteinuria). (Jernigan-Vanderbilt)

EFFECT OF WATER ON BACTERIAL MULTIPLICATION IN PLANT TISSUE,
Department of Scientific and Industrial Research, Auckland (New Zealand). Plant Disease Div.
J. M. Young.
N Z J Agric Res 17(1): 115-119, Illus. 1974.

Descriptors: Beans, *Bacteria, *Growth rates, Effects, Pathogenic bacteria, *Plant tissues, Nutrients, Water pollution effects, Water pollution control.
Identifiers: Erwinia-herbicola, Psuedomonas-fluorescens, Pseudomonas-lachrymans, Pseudomonas-phaseolicola, Pseudomonas-putida, Pseudomonas-syringae, Nonpathogenic bacteria, *Peptone.

When pathogenic and non-pathogenic bacteria were inoculated into bean leaves which were then kept saturated with water, those bacteria which are normally limited in growth increased in numbers. Pathogens (Pseudomonas lachrymans and P. syringae) in heterologous relationships with beans multipled at a rate equal to the homologue P. phaseolicola, and to higher stationary-phase populations than developed under normal conditions of plant growth. Non-pathogenic bacteria (P. fluorescens, P. putida and Erwinia herbicola) increased in numbers, but their stationary-phase populations were lower than those of the pathogens. Peptone added as a bacterial nutrient to the inoculum of P. fluorescens did not affect the growth of the non-pathogen in bean leaves. The availability of nutrients and water to bacteria in the intercellular spaces of leaf tissue may be important parameters regulating their development. The function of water as a determinant of specificity in host-pathogen relationships in the field is discussed.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF BIOTIC AND ABIOTIC FACTORS ON THE TOXICITY OF ENTOBACTERIN FOR LARVAE OF BLOOD-SUCKING MOSQUITOES AND BITING MIDGES, (IN RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Institut Zoologii.
O. G. Saubenova.
Izv Akad Nauk Kaz SSR Ser Biol, Vol 5, p 26-30, 1973.
Identifiers: Aedes-aegypti, Aedes-caspius, Aedes-flavescens, Anopheles-hyrcanus, Culex-modestus, Culex-pipiens, Culicoides-sp, Culiseta-alaskaensis, *Entobacterin, Larvae, *Midges, Mineralization, *Mosquitoes, Tabanus-sp, Temperature, *Toxicity, Water pollution effects, Biota.

The toxic effect of the microbial preparation entobacterin was investigated on the larvae of blood-sucking mosquitoes and biting midges (Aedes caspius, A. aegypti, A. flavescens, Culex pipiens, C. modestus, Culiseta alaskaensis, Anopheles hyrcanus, Tabanus sp., Culicoides sp.). The effectiveness of the preparation was studied in relation to the effect of biotic and abiotic factors: species and age composition of the mosquitoes and midges, temperature regime, pH of the water, degree of its mineralization, and the detoxifying effect of the substrate. The use of entobacterin is most effective during the hot summer when the bodies of water are heated to 25-30C and the water in them have feeble mineralization with pH 7.0.--Copyright 1974, Biological Abstracts, Inc.

5D. Waste Treatment Processes

PRACTICAL TREATMENT OF FEEDLOT RUNOFF,
Nebraska Univ., Lincoln. Water Resources Research Inst.
T. J. McGhee.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 629, $3.25 in paper copy, $2.25 in microfiche. Completion Report, June 15, 1974. 18 p, 11 fig, 1 tab, 8 ref. OWRT A-027-NEB(6).

Descriptors: Water quality, Runoff, *Feed lots, *Waste water treatment, *Farm wastes, *Biological treatment, *Aerobic treatment, Color, Adsorption, Design, Chemical oxygen demand, Soils, Agricultural runoff.

A field treatment system was designed, based upon the results of laboratory studies, to treat settled feedlot runoff. The system was operated at liquid retention times of one to four days. Routine data measurements included COD of the raw and treated wastes, influent, effluent, and mixed liquor suspended solids, organic and ammonia nitrogen, mixed liquor dissolved oxygen and effluent BOD. Laboratory studies of residual color removal by adsorption on soil columns were conducted. The soil columns ranged in depth from 3 to 6 feet and were loaded at rates ranging from one to four inches per day. Routine determinations of influent and effluent COD and color were made. Conclusions were: (1) settled feedlot runoff may be effectively stabilized in an aerobic biological treatment system operated at a liquid retention time of two days; (2) the design parameters for such a system are similar to those of high-rate activated sludge; and (3) the humic color characteristic of feedlot runoff is effectively removed by adsorption on soil particles.

EXPERIMENTAL OPTIMIZATION OF A STEP AERATION WASTE TREATMENT PROCESS,
Kansas State Univ., Manhattan. Dept. of Chemical Engineering.
G. C. Y. Chu, L. E. Erickson, and L. T. Fan.
Biotechnology and Bioengineering, Vol XVI, p 231-250, 1974. 6 fig, 7 tab, 13 ref, (KWRRI Contribution No 117). OWRT A-045-KAN(8). 14-31-0001-3516.

Descriptors: *Activated sludge, *Waste water treatment, *Biological treatment, *Optimization, *Aeration, Chemical oxygen demand.
Identifiers: Experimental optimization, Step aeration.

Evolutionary operation (EVOP) was used to experimentally investigate the optimum steady state operating conditions for a step aeration activated sludge waste treatment process. A laboratory scale two tank step aeration activated sludge unit with fixed total volume, total influent flow rate, recycle flow rate, and sludge wasting rate was employed. The volume ratio and flow rate ratio which minimized effluent chemical oxygen demand were determined. The results indicate that EVOP is a useful technique for improving the performance of biological processes.

PURIFIED WASTEWATER-THE UNTAPPED WATER RESOURCE,
Envirotech Corp., Menlo Park, Calif.
F. P. Sebastian.
Journal Water Pollution Control Federation, Vol 46, No 2, p 239-246, 1974. 3 fig, 3 tab, 21 ref.

Descriptors: *Waste water treatment, *Water supply development, Recycling, Water sources, Tertiary treatment, Annual costs, Capital, *Water reuse.

Purified wastewater has become an increasingly important source of water. A recent U.S. government study of 155 communities with populations over 25,000 indicates, for example, that 145 presently have some raw waste in their water supplies. Several communities, including Windhock, South West Africa; Lake Tahoe, California; Colorado Springs, Colorado; and Rye Meads, U.K., have recently applied advanced waste treatment technology to boost existing tap, trout lake, swimming, irrigation, and industrial cooling water supplies. Treatment plants for the respective communities utilize biological-algae-physical-chemical, biological-physical-chemical, biological-physical-chemical, and extended-biological techniques to meet required quality standards. Some earlier problems of wastewater reuse have been resolved. First, problems of dissolved solids buildup have not resulted because not all water is recycled. Second, a number of toxic materials present in wastewater are effectively eliminated in the advanced treatment stage. Third, potential hazards from viruses have been virtually nonexistent to this point. Cost estimates for the summarized advanced treatment methods indicate conventional primary-secondary-tertiary treatment is more expensive than independent physical-chemical treatment for similar effluent, although the latter is generally more expensive in producing water up to primary-secondary treatment quality. Potential benefits arising from the development of an advanced treatment potential, in addition to increased water supplies, are listed. (Schroeder-Wisconsin)
W75-03337

HOUSTON SUBURBS PROFITS FROM BUILDING THE STATE'S WASTEWATER TREATMENT PLANT.
Water and Sewage Works, Vol 121, Reference Number, p R38-R40, April 1974.

Descriptors: *Waste water treatment, *Tertiary treatment, *Pollution abatement, *Texas, Investment, Facilities, Regional development, *Treatment facilities, *Costs.
Identifiers: Montgomery County(Tex), Harris County(Tex), Houston(Tex).

While many communities point to the high costs in justifying their failure to utilize today's best water pollution abatement techniques, a Houston, Texas suburb has shown how a high quality, three stage sewage treatment plant can be profitable. The approach shows a way to insure adequate sewage treatment for future community needs while still not overburdening the present 1600 residents: install a large advanced treatment plant, then sell excess capacity to neighboring districts. Within two months of the plant's operation, the district has found buyers willing to pay $308,000 to utilize 700,000 of the plant's 1 mgd capacity. This annual income significantly defrays the costs of equipment, land, engineering, and legal fees ($400,000) and the 9.2 miles of sewage tank lines ($800,000). Future expansion is seen on the community's 20 acre treatment site to provide a 20 mgd treatment capacity serving the 200,000 people in Montgomery County and Harris County which includes Houston. The ingenuous approach has worked, providing citizens of the area with high quality effluent which has equaled or bettered a 5 mg/l BOD and suspended solid levels, four times better than Texas' requirement and at a reasonable cost. (Schroeder-Wisconsin)

BACTERIOLOGY OF CHLORINATED AND UNCHLORINATED WASTEWATER EFFLUENTS,
North Texas State Univ., Denton. Dept. of Biological Sciences.
J. K. G. Silvey, R. L. Abshire, and W. J. Nunez.
Journal Water Pollution Control Federation, Vol 46, No 9, p 2153-2162, September 1974. 1 fig, 7 tab, 20 ref.

Descriptors: *Chlorination, *Pathogenic bacteria, *Waste water treatment, Pollution abatement, Streptococcus, Coliforms, Salmonellae, Biochemical oxygen demand, Dissolved oxygen, Microorganisms, *Texas, Chlorine.
Identifiers: Trinity River(Tex), Fecal coliforms, Nonfecal coliforms, Fecal streptococci.

Chlorination has not been widely practiced in the treatment of waste water although chlorination of finished water is standard procedure for the purpose of eliminating pathogenic bacteria. The current emphasis on curtailment of further massive pollution of water by waste products has made necessary a re-evaluation of waste water treatment methods. A bacteriological and chemical study was made on part of the Trinity River in Texas. High numbers of fecal coliforms and fecal streptococci were attributed to the presence of waste effluents. Chlorination was effective in reducing the quantities of microorganisms only where the chlorine was directly applied. Bacterial populations recovered immediately after chlorination was ended. Decreasing susceptibility of microbial organisms to chlorine was, in this order: beneficial heterotrophic organisms, fecal coliforms, nonfecal coliforms and fecal streptococci. Chlorination did not effectively destroy Salmonellae. The BOD and DO of the effluent improved as a result of chlorination. The data obtained indicate that chlorination did not effectively improve the conditions of the river. (Orr-FIRL)

LIQUID WASTE TREATMENT METHOD USING MICROORGANISM AS ADSORBENT (BISEIBUTSU O KYUCHAKUZAI TO SHITA HAISUI SHORIHO),
H. Kobayashi.
Gijutsu to Kagai, Vol 4, No 4, p 39-43, July 1974. 3 fig.

Descriptors: *Bacteria, *Mercury, *Adsorption, *Heavy metals, *Yeasts, Water pollution sources, Water treatment, Pollutants, Chlorella, Liquid wastes, Foreign research, Foreign countries, *Waste water treatment, Degradation(Decomposition), Microorganisms.
Identifiers: Japan, Saccharomyces cerevisiae, Torulopsis utilis.

The use of a type of pseudomous bacteria for decomposition of organic mercury compounds was developed by the Fermentation Research Institute (the present Microbiol Industrial Technology Research Institute). Generally, continuous treatment of toxic heavy metals by this method is extremely difficult. Heavy metal ions are considered water pollutants because of their easy accumulation in living organisms. Research was performed on the ability of yeast, chlorella, and bacteria to remove heavy metal ions, detergent, and dyes both by adsorption on the cell surfaces and by internal absorption. Saccharomyces cerevisiae (store bought bread yeast) and Torulopsis utilis (feed yeast) were used because of their easy accessibility. The results showed that depending on the bacterial cell, sodium, potassium, potassium bichromate and arsenic oxide were not adsorbed, but mercury, lead, cadmium, and other plus metal ions and aluminum ion were relatively well adsorbed. Basic dye, which turns into plus ion in a neutral solution, was adsorbed well, but acidic dye and catalytic dye were not. These physiochemical reactions are explained and their application for liquid waste treatment is discussed. However, at the present stage of research, the unsolved problems are too many, the cost of such a system is unfeasible, and the development of much less expensive microbial agents is not yet foreseeable. (Siegle-FIRL)

DISINFECTION,
Texas Univ., Houston.
E. M. Davis, L. W. Whitehead, and J. D. Moore.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1181-1191, June 1974. 102 ref.

Descriptors: *Disinfection, *Reviews, Publications, Water supply, *Waste water treatment, Research and development, Patents, *Chlorination, Tertiary treatment, *Bibliographies, Methodology, Kinetics, Filtration, Biological treatment.

The methodology and techniques developed and used in disinfection which have been reported in

recent literature are reviewed. The need for increased attention in providing safe water supplies, adequately disinfecting waste water, and overall research is emphasized. Disinfection kinetics and chlorine research are highlighted. The possibility of using biological filtration and chlorination as tertiary treatment methods and the biological effects of chlorine are mentioned. Finally, three patent applications on disinfection are discussed. (Sandoski-FIRL)

WATERLESS SANITATION FOR REST AREAS,
Chrysler Corp., New Orleans, La. Space Div.
R. W. Fullerton.
Water and Sewage Works, Vol 121, No 6, p 86-88, June 1974. 1 fig, 2 tab.

Descriptors: *Sewage disposal, *Sewerage, *Separation techniques, Treatment facilities, Domestic wastes, *Waste water treatment, Incineration.
Identifiers: Mineral oil.

Since 1970, the Chrysler Corporation's Space Division has been developing marine and land based sewage disposal systems. One such system is a closed loop no-discharge nonbiological sewage disposal system which uses mineral oil as the flush fluid to transport human waste instead of water. The flushing fluid carries waste from conventional commodes to a separation tank where the sewage is separated by gravity. The fluid is filtered, purified, and reused indefinitely. Disposal is by burning in a pollution-free incinerator. (Sandoski-FIRL)
W75-03370

ANAEROBIC DIGESTION OF ORGANIC MATTER,
Rowett Research Inst., Bucksburn (Scotland).
P. N. Hobson, S. Bousfield, and R. Summers.
Critical Reviews in Environmental Control, Vol 4, No 2, p 131-191, July 31, 1974. 6 fig, 197 ref.

Descriptors: *Reviews, *Anaerobic digestion, *Waste water treatment, Equipment, Model studies, Theoretical analysis, Bacteria, Biochemistry, *Organic matter, *Filters, Digestion, *Digestion tanks, *Bibliographies.
Identifiers: *Digester systems.

Treatment of waste products is of current concern. The biochemistry of anaerobic digestion is discussed with regard to anaerobic metabolism in the rumen and in digesters, to the composition of digester feedstocks, cellulose digestion, to digestion of nitrogenous and lipid materials, minor bacterial metabolites in digesters, effects of growth rate, substrate concentration, and pH, and fermentation. Theoretical digester systems and modeling of digester systems are presented with emphasis on the high rate digester, tow-stage digester, and the anaerobic filter system. The bacterial populations of anaerobic digesters and practical aspects of anaerobic digestion systems are mentioned. (Sandoski-FIRL)
W75-03371

UNIQUE NEW SECONDARY OXYGEN TREATMENT SYSTEM FOR EFFLUENT.
Paper Trade Journal, Vol 158, No 31, p 22-23, August 5, 1974. 2 fig.

Descriptors: *Sewage treatment, *Waste water treatment, Water pollution, Chemical wastes, Pulp and paper wastes, Aeration, Activated sludge, Municipal wastes, Effluents, Industrial wastes, Oxidation, *Oxygenation, Activated sludge.
Identifiers: Secondary oxygen treatment systems, Pipeline waterfall reactors, *Black liquor oxidation.

A forced free-fall oxygenation (F3o) waste water treatment system has been developed by a unit of Airco Industrial Gases. This system is designed for municipal, chemical, pulp and paper waste usage. Conventional aeration tank capacity may be doubled or tripled by this system. It can also be used in conjunction with new activated sludge plants of existing operations. The waterfall principle is used in individual modular mixing and dissolving units. Also developed was a simple pipeline waterfall reactor useful in black liquor oxidation. (Leibowitz-FIRL)

NEW CONCEPTS FOR CLARIFICATION OF WATER USING SOME ALTERNATIVES TO ALUM,
Regional Engineering Coll., Durgapur (India).
M. N. Rao, and A. K. Datta.
Journal of the Institution of Engineers (India), Vol 54, No PH2, p 57-60, February 1974. 5 fig, 12 ref.

Descriptors: *Water purification, *Alum, *Polyelectrolytes, *Magnesium carbonate, *Foaming, Coagulation, *Waste water treatment, Colloids, Bacteria, Dyes, Municipal water, Potable water.
Identifiers: *Cationic polymers.

Alum has been fundamental in the clarification of municipal waste water for drinking purposes for centuries. The employment of alum as a coagulant in sophisticated water treatment plants is nearly universal. New concepts in the field of clarification of water recommend the use of polyelectrolytes, foam, and magnesium carbonate as alternatives to alum. Polyelectrolytes are polymers with only the cationic being used as prime coagulants. They exhibit a high charge density, and when added as a coagulant, the positively charged polymers are absorbed on the surface of the negatively charged colloidal impurities of water. The particle surface charged is reduced or used sufficiently to allow cohesion and aggregation on collision. Foam has only a limited field of application in treatment of turbid water. A cationic surfactant is added to and mixed with the raw water, and passes to a flotation cylinder. The surfactants are both collector for the colloidal turbidity particles and frothing agent for carrying particles from the solution. When using magnesium carbonate as a coagulant, the sludge problem is often totally eliminated. (Leibowitz-FIRL)
W75-03374

CONCENTRATION OF POLARISATION IN REVERSE OSMOSIS FLOW SYSTEMS UNDER LAMINAR CONDITIONS. EFFECT OF SURFACE ROUGHNESS AND FOULING,
Birmingham Univ. (England). Dept. of Chemical Engineering.
J. W. Carter, G. Hoyland, and A. P. M. Hasting.
Chemical Engineering Science, Vol 29, No 7, p 1651-1658, 1974. 1 fig, 3 tab, 18 ref.

Descriptors: *Reverse osmosis, *Transition flow, *Membranes, Membrane processes, Fouling.
Identifiers: Cellulose acetate membranes, Distilled water fluxes, *Polarization, Rough membrane surfaces.

Experimentation in reverse osmosis was conducted under laminar flow conditions in a channel of cross-section 3.38 mm. Solution concentrations giving pi f/delta p up to 0.66 and cellulose acetate membranes having high rejections and distilled water fluxes of 12-15 x 0.0001 cm/sec were employed. A close prediction was made by a numerical solution of the theoretical equations of the product fluxes and concentration polarization. The effects of rough membrane surfaces in increasing polarization and decreasing product flux were also predicted utilizing a roughness depth determined from a profile of the surface irregularities. A rust layer on the membrane surface had like effects on flux and polarization which were calculable. (Leibowitz-FIRL)

TREATMENT OF WASTE-WATER CONTAINING SURFACE ACTIVE SUBSTANCES, (IN JAPANESE),
K. Hagiwara, and Y. Murakami.
Bulletin of the Government Industrial Research Institute, Osaka, Vol 24, No 4, p 325-330, December 1973. 8 fig, 3 tab, 5 ref. English summary.

Descriptors: *Water pollution, *Waste water treatment, *Sludge disposal, Hydrogen ion concentration, *Phenols, Iron, Aluminum.
Identifiers: Polyhydric phenol, *Polysaccharose, Ethylene glycol molecules, *Surface active substances, Ferric ion, Aluminum ion.

A condensed product of polyhydric phenol and polysaccharose was discovered to be effective for removal of nonionic surface active substances, in a new method of waste water treatment. This can also be used in the treatment of emulsified oil. The condensed product is added to waste water and ferric or aluminum ion is added as a coagulant, with the pH value of the solution adjusted to between 5 and 6. The solution is filtered and the sludge treated by a method such as burning. The treatment's efficiency is dependent upon the number of ethylene glycol molecules in the surface active substance. Efficiency decreases as the number of ethylene glycol molecules increases. The solubilities of the reaction product of the surface active substance and the condensed product of polyhydric phenol and polysaccharose increases as the ethylene glycol molecule increases. With the surface active substance at a concentration of 1,000 ppm, more than 90 percent of the surface active substance was removed. (Leibowitz-FIRL)

UPFLOW FILTRATION IMPROVES OXIDATION POND EFFLUENT,
Nebraska Univ., Lincoln. Engineering Research Center.
T. J. McGhee, and R. K. Patterson.
Water and Sewage Works, Vol 121, No 7, p 82-83, July 1974. 3 fig, 11 ref.

Descriptors: *Waste water treatment, *Oxidation lagoons, Effluents, Sewage treatment, Water quality control, *Filtration, *Biochemical oxygen demand, Coagulation, Alum, Flocculation, Aggregation, Polyelectrolytes, Algae, Industrial wastes.
Identifiers: *Upflow filtration.

Oxidation ponds are an effective, uncomplicated and economical way of treating domestic sewage and certain industrial wastes. The system requires no skilled operator or maintenance. Through evaporation and seepage the total reduction in BOD through an oxidation pond can approach 95 percent, although the actual concentration of BOD and suspended solids may not meet the new standards of 30 mg/liter monthly average and 45 mg/liter weekly average determined for secondary treatment. The material which contributes to the BOD effluent and suspended solids of oxidation ponds is largely algal cells utilizing inorganic byproducts of the bacterial oxidation of the waste. Techniques listed for removal of algae include coagulation with alum, coagulation with alum and polyelectrolytes, flocculation and aggregation on cationic exchange resins, chlorine disinfection, anaerobic rock filters, fly ash slurry filtration, pressure filtration through a diatomaceous earth filter, and sand filtration. (Leibowitz-FIRL)

LIME SLUDGE: SOME PROBLEMS–SOME SOLUTIONS,
Grand Rapids Municipal Water Plant, Mich.
D. E. Hazelswatts.
Water and Sewage Works, Vol 121, No 7, p 72-73, July 1974. 3 fig.

Descriptors: *Waste water treatment, *Sludge, *Centrifuges, *Flocculant, Costs, Lime, *Michigan, Polymers, Water treatment.
Identifiers: *Lime sludge, Grand Rapids(Mich), Grand River(Mich), Bird centrifuge, Nalco 'Instant' polymer.

The Grand Rapids municipally owned water system operates from two sources of supply, Lake Michigan and Grand River. Lime-softened river water produces 2260 pounds of solids per million gallons, producing at maximum rate 90,400 pounds of sludge per day. When the sludge was put in sewers to be dewatered, lime precipitates formed a pasty sludge heavier than sewage, causing the machinery to break down. After investigation, a Bird 36x72 inch solid bowl centrifuge with a spiral scraper was installed. Flocculant was injected through a 3/4 inch diameter pipe inside the feed pipe; however, results with the flocculant were no better than without; the flocculant pipe had broken. The baffle hole surrounding the flocculant pipe was enlarged; the machine is still operant. Because of problems of dissolving the sludge and also poor working conditions caused by the accumulation of the powdered flocculant on walkway surfaces, a new liquid flocculant was tried. The liquid flocculant proved as effective as the dry flocculant, but twice the amount was required. However, the cost of the required quantity of liquid is about half. Therefore the overall cost is the same, and the convenience and safety are much improved. The cake produced by the centrifuge is hauled to a driving yard. (Carpenter-FIRL)

TREATMENT FACILITY INCORPORATES UNIQUE DESIGN FEATURES,
Carollo (John) Engineers, Santa Ana, Calif.
G. P. Lynch.
Public Works, Vol 105, No 9, p 106-107, September 1974. 3 fig.

Descriptors: *Waste water treatment, Facilities, *Design, Digestion, Flow rates, Sedimentation, Operation and maintenance, *California, Municipal wastes, *Treatment facilities, *Anaerobic digestion.
Identifiers: *Degasification, Peaking ponds, Redlands(Calif).

The city of Redlands, California, is currently upgrading and increasing the capacity of their existing waste water treatment facilities. Two unique design features of the new system include a digester supernatant degasification facility to allow further concentration of supernatant following high rate primary-secondary anaerobic digestion and a peaking pond to limit peak flow rates to existing secondary treatment facilities and to third-stage ammonia conversion facilities. The new facilities are two rectangular tanks with a bottom width of 21 feet and length of 11 feet, side slopes at 3 to 1 covered with 4 inches of concrete, a normal working depth of 6 feet, and 2 feet of freeboard. A decant box pump at one end, with a scumbaffle and adjustable overflow weir, return the decanted liquid to the plant influent flow. A sump at the opposite end from the decant box collects the concentrated sludge. Effects of the facilities which have not yet been evaluated include: optimum process control of third stage biological facilities due to more uniform flow rates; greater effluent solids control caused by reduction of peak flow rates on second and third-stage sedimentation facilities; equalization of organic loadings; and, operational flexibility. BACTERIAL PRODUCTION OF ENZYMES IN ACTIVATED SLUDGE SYSTEMS,
Connecticut Agricultural Experiment Station, New Haven. Dept. of Biochemistry.
L. Handin, and D. C. Sands.
Journal Water Pollution Control Federation, Vol 46, No 8, p 2015-2025, August 1974. 14 tab, 14 ref.

Descriptors: *Sludge treatment, *Waste water treatment, *Bacteria, *Activated sludge, *Enzymes, *Biological treatment, Microbial degradation, Sludge, Effluents, Biodegradation, Microorganisms, Treatment facilities.

The five important stages (raw influent, primary effluent, mixed liquor, activated sludge, final effluent) in four activated sludge treatment facilities were examined to determine the numbers and percentages of bacteria capable of producing specific enzymes. The activated sludge contained the greatest total number of bacteria, followed by the number in the mixed liquor. A 17- to 93-fold increase was evident between raw influent and mixed liquor and activated sludge. There is not a selective removal of any one specific bacterial type in the primary effluent stage. From the primary effluent to the mixed liquor stage, a selective process seems to occur which favors bacteria with certain enzymatic capabilities. Bacteria in enzyme categories not readily precipitated in the sludge appear in higher numbers in the final effluent. The fact that the increase of bacteria from the mixed liquor and the activated sludge was not greater than was found may indicate that activated sludge contains more undegraded material than bacterial cells or, if the sludge is predominately bacteria, that they are dead cells. The lack of significant difference between these two stages may mean that the percentage of active bacteria tends to equalize in the aeration step. The information obtained could be useful when considering the possible use of stabilized enzymes in lieu of, or in addition to, microorganisms. (Orr-FIRL)

COMPARISON OF COMPLETELY MIXED AND PLUG FLOW BIOLOGICAL SYSTEMS,
Fehr and Graham Consulting Engineers, Freeport, Ill.
E. D. Toerber, W. L. Paulson, and H. S. Smith.
Journal Water Pollution Control Federation, Vol 46, No 8, p 1995-2014, August 1974. 26 fig, 9 tab, 3 ref.

Descriptors: *Activated sludge, *Waste water treatment, Evaluation, Flow rates, Organic loading, Construction, Design, Illinois, Biochemical oxygen demand, Chemical oxygen demand, *Biological treatment.
Identifiers: Completely mixed system, Plug flow.

The performance of a completely mixed activated sludge system and the performance of a plug flow system under parallel operating conditions were compared. The two systems were tested with waste from Freeport, Illinois. Under normal operating conditions both the completely mixed and the plug flow systems had similar removal efficiencies. If there were separate operating conditions and constant influent flow rates, both systems showed a rapid leveling off of removal efficiency after a nominal aeration detention time of 2 to 3 hours. The completely mixed system exhibited an overall removal efficiency ten percent greater than the plug flow system when both were subjected to a severe shock load. (Orr-FIRL)
W75-03381

HIGH RATE BIOLOGICAL DENITRIFICATION USING A GRANULAR FLUIDIZED BED,
Manhattan Coll., Bronx, N.Y. Dept. of Civil Engineering.
J. S. Jeris, C. Beer, and J. A. Mueller.
Journal Water Pollution Control Federation, Vol 46, No 9, p 2118-2128, September, 1974. 11 fig, 4 tab, 11 ref.

Descriptors: *Biological treatment, *Activated sludge, *Carbon, *Nitrogen, Research and development, Microorganisms, Microbial degradation, Equipment, Trickling filters, *Waste water treatment, Nutrient removal, *Denitrification.
Identifiers: Granular fluidized bed.

Using fluidized, small media for biological removal of contaminants in a reactor has the advantages of greater surface area available for growth per unit of reactor volume, very small head loss, no danger of clogging, and easier carrier removal procedure. A fluidized bed is a solid, granular carrier medium in a columnar reactor suspended in an upflowing fluid. An experimental apparatus was designed and tested for denitrification capabilities. A major problem with the process was the continual growth of the organisms on the carbon particles. This caused bed expansion and necessitated the removal of part of the biologically coated carbon to prevent bed overflow. The idea of achieving a balance between growth and washoff similar to that found in a trickling filter was dropped because increasing the flow failed to affect the growth on the media. It was estimated that the chemical costs would be slightly over $0.02/1000 gal for removal of 25 mg/liter nitrate nitrogen. The nitrogen removals obtained ranged from 257 to 424 lb inorganic nitrogen/ day/1000 cu ft of reactor capacity. When the hydraulic loading was 12 gpm/sq ft, the superficial detention time required was about seven minutes for removal of 20 to 35 mg/liter nitrogen. The fluidized biological bed concept has demonstrated the ability to remove more nitrogen than the activated sludge process and requires less detention time than other biological waste treatment systems. COMBINED CHEMICAL-BIOLOGICAL TREATMENT STUDIES,
Institute for Water and Air Pollution Research, Stockholm (Sweden).
H. O. Bouveng.
Pure and Applied Chemistry, Vol 37, No 3, p 329-341, 1974. 10 fig.

Descriptors: *Sewage treatment, *Biological treatment, Chemical precipitation, Phosphorus, Biochemical oxygen demand, *Waste water treatment, Costs, Municipal wastes, Industrial wastes.
Identifiers: *Chemical-biological treatment.

The OECD study of chemical treatment of urban sewage is discussed with special reference to the relation between cost and performance of alternative processes. The application of combined chemical and biological treatment processes is discussed with emphasis on the factors which influence the stability of performance. Considering chemical treatment of urban sewage only as a method for phosphorus removal is an unjustified limitation of its application. Chemical precipitation of urban sewage is a profitable alternative when an effluent having a low and stable level of residual BOD is desired. Chemical treatment is a useful supplement to biological treatment of industrial waste water when the latter is not able to achieve the required effluent quality. (Orr-FIRL)

DESALINATION - NEW WATER FOR OLD (ENTSALZUNG-FRISCHWASSERVERSORGUNG UND ABWASSERAUFBEREITUNG),
United Kingdom Atomic Energy Authority, London (England).
O. Pugh.
Meerestechnik, Vol 5, No 4, p 119-123, August, 1974. 7 fig.

Descriptors: *Desalination, *Potable water, *Reverse osmosis, *Waste water treatment, Distillation, Water quality control, Water resources, Water reuse.

Previously desalination has been used to provide an essential commodity for man--potable water. The newer desalting processes are becoming more important in waste treatment. Desalination technology, which has been mainly distillation processes, contributes to only one aspect of the complete water cycle. The advent of the reverse-osmosis system introduces the technology to the area of protection of clean water resources from the discharge of polluting waste. Reverse-osmosis can also be used for the renovation of waste water. (Orr-FIRL)

ADSORPTION PROCESSES,
Michigan Univ., Ann Arbor. Coll. of Engineering.
W. J. Weber.
Pure and Applied Chemistry, Vol 37, No 3, p 375-392, 1974. 6 fig, 1 tab, 15 ref.

Descriptors: *Waste water treatment, *Adsorption, *Activated carbon, Water reuse, Costs, Municipal wastes, Effluents, Organic loading, Toxicity, Heavy metals, Phosphorus, Design, Operation and maintenance.
Identifiers: *Physicochemical treatment.

Adsorption is a basic process in the physiochemical treatment of municipal waste water. This treatment can economically meet the higher effluent standards and water reuse requirements of today. Activated carbon is the most effective adsorbent for this method. Expanded-bed contact systems are the most efficient means for utilizing granular carbon for waste treatment. Augmentation of the adsorption process occurs as an in-situ partial regeneration resulting from biological growth on the surfaces of the carbon. The system produces high levels of treatment and has a high degree of stability and reliability. It is very resistant to shock loads and toxic waste constituents. The advantages of a physicochemical system over a biological system include: less land is required; a lower sensitivity to diurnal variation exists; it is unaffected by toxic substances; and the former has a potential for significant removal of heavy metals. In addition, a physicochemical system gives excellent removal of phosphates and organic waste constituents and greater flexibility in design and operation. (Orr-FIRL)

ESTIMATION THEORETIC APPROACH TO ANALYSIS, SYNTHESIS, AND SOLUTION OF DYNAMIC SYSTEMS, PART I,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
P. K. Misra.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-238 146, $7.00 in paper copy, $2.25 in microfiche. Kansas Water Resources Research Institute, Manhattan, 1971. 162 p, 34 fig, 20 tab, 118 equ. OWRT A-048-KAN(2).

Descriptors: *Water quality, Streams, *Waste water treatment, *Estimating, *Filters, Dynamic programming, Measurement, Systems analysis, Equations, Mathematical models, Simulation analysis, Algorithms, *Filtration.
Identifiers: Linear estimation theory, Nonlinear estimation theory, Process dynamics, Physical processes, Accuracy, Kalman filters, Invariant imbedding filters.

This is Part I of a Doctoral Thesis which demonstrates that linear and nonlinear estimation theory can be used successfully in the identification of states and parameters in a conceptual model of a dynamic physical process. In this first part, stream quality and waste water treatment processes are examined. A two-dimensional stream quality model is used to investigate linear estimation theory; for nonlinear theory, nonlinearity is entered either through the process dynamics model or through an arc-tan measurement model. Out of eight filters studied, two result for linear systems: the Kalman and the invariant imbedding. It is concluded that although the invariant imbedding filter is simpler in its derivation, the Kalman filter's performance is significantly better. Nonlinear process dynamics with linear measurement models results in three different filters -- linearized Kalman, invariant imbedding or dynamic programming, and a first-order minimal variance filter; the latter proves best regarding estimation accuracy. Finally, the nonlinear dynamics coupled with the nonlinear measurement scheme yields all eight filters. Again, the first-order minimal variance is proved to be the best. ESTIMATION THEORETIC APPROACH TO ANALYSIS, SYNTHESIS, AND SOLUTION OF DYNAMIC SYSTEMS, PART II,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
P. K. Misra.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-238 599, $7.00 in paper copy, $2.25 in microfiche. Kansas Water Resources Research Institute, Manhattan, 1971. 186 p, 37 fig, 5 tab, 145 equ, 286 ref. OWRT A-048-KAN(2).

Descriptors: *Model studies, Hydrologic systems, *Chemical reactions, *Waste water treatment, Activated sludge, Streams, Optimization, Water quality, *Estimating, Measurement, Simulation analysis, *Filters, Equations, Systems analysis, *Filtration.
Identifiers: Linear estimation theory, Nonlinear estimation theory, Process dynamics, Physical processes, Optimal weighting function, Sensitivity analysis, Search techniques, Parametric analysis, *Convergence, Accuracy, Invariant imbedding filters.

This is Part II of a Doctoral Thesis which demonstrates that linear and nonlinear estimation theory can be used successfully in the identification of states and parameters in a conceptual model of a dynamic physical process. In this second part, waste water treatment, hydrologic system, and chemical reaction processes are examined. Considered is convergence, an important criteria for any sequential scheme; convergence depends highly on the initialization of certain parameters, the estimation of which is not simple (for practical problems). Two algorithms are developed to improve the convergence of filters. One employs a 'search' technique to determine the optimal initial conditions, and the other uses a local sensitivity concept to achieve the same end result. It is demonstrated that states and parameters of a waste water treatment process and a hydrologic model can be estimated effectively using a first-order minimal variance filter; this strengthens the applicability of the estimation theory to dynamic systems. Because of the wide range of applicability of the invariant imbedding concept, computational improvements have been suggested for the invariant imbedding filter; these can be applied equally well to all filters. ARGONNE NATIONAL LABORATORY, WASTE MANAGEMENT PROGRAMS QUARTERLY REPORT, OCTOBER-DECEMBER 1973,
Argonne National Lab., Ill.
M. J. Steindler, N. M. Levitz, L. E. Trevorrow, T. J. Gerding, and B. J. Kullen.
Available from the National Technical Information Service, Springfield, Va. 22161, as Rept. No ANL-8087, $4.00 in paper copy, $2.25 in microfiche. Report No ANL-8087, February 1974. 45 p, 3 fig, 7 tab, 144 ref, append.

Descriptors: *Radioactive wastes, Water pollution sources, *Nuclear wastes, Nuclear powerplants, *Plutonium, Fuels, *Radioactivity effects, Radiochemical analysis, Research and development, Water pollution treatment, Tritium, Hydrogen, Water, Separation techniques, Waste storage, Reverse osmosis, Membrane processes, Transport, Economics.
Identifiers: *Waste management, *Fuel reprocessing, *Zircaloy.

Metal-compaction methods have been reviewed and information on the irradiation-induced property changes of Zircaloy surveyed as part of a study on the handling of fuel cladding hulls. Information originating from AEC-site visits and from a review of the open literature concerning decontamination of plutonium-contaminated materials is presented. The technical and economic feasibility of adapting reverse osmosis to the concentration of tritium from tritiated fuel reprocessing wastes was briefly evaluated. Technical feasibility was assumed from literature reports of a difference of about 3% in the self-diffusion coefficients of THO and H2O, and possibly greater differences in transport rates in solution-diffusion membranes. The costs of such a process werw calculated. The result ranged from 10(-4) to 1 mill/kWh of nuclear power, depending on the assumed single-stage separation factor and whether tritium-depleted water was recycled to the reprocessing plant. (See W75-03416 thru W75-03418) (Houser-ORNL)

CONSOLIDATION TECHNIQUES FOR FUEL CLADDING HULLS,
Argonne National Lab., Ill.
N. M. Levitz, and B. J. Kullen.
In: Argonne National Laboratory Waste Management Programs Quarterly Report, October-December, 1973. Report No ANL-8087, p 3-12, February 1974. 2 fig, 4 tab.

Descriptors: Management, *Nuclear wastes, *Water pollution sources, *Fuels, *Radioactivity, *Zirconium, Compaction, Contaminants, *Waste treatment, Waste storage, Waste disposal, Alloys, Consolidation, Compressibility, Comparative costs, Economics, Transportation.
Identifiers: Fuel reprocessing wastes, *Zircaloy.

The studies in this program involve (1) characterization of waste Zircaloy hulls from the chop-leach processing of spent water cooled reactor (LWR) fuel; (2) review of experience with pyrophoricity of Zircaloy and related hull-handling practice; and (3) review of mechanical-compaction experience and related problems. Work in this quarter has been on the review of compaction methods and the properties of zirconium that could adversely affect the safety of compaction processes. The review will be the basis of an evaluation of compaction methods and the development of an experimental program to obtain data that are not available in the literature or are of uncertain quality. The primary incentive for compacting Zircaloy hulls is the economic savings gained by volume reduction. Information in the literature indicates that this reduction in volume would result in cost savings for containers, interim storage, shipment, and ultimate storage/disposal. (See also W75-03415) (Houser-ORNL)
W75-03416

SALVAGE OF ALPHA-CONTAMINATED METALS,
Argonne National Lab., Ill.
M. J. Steindler, and T. J. Gerding.
In: Argonne National Laboratory Waste Management Programs Quarterly Report, October-December 1973. Report No NAL-8087, p 13-19, February 1974.

Descriptors: Management, *Nuclear wastes, *Plutonium, *Waste treatment, *Waste storage, Separation techniques, Research and development, Water pollution sources, Nuclear power plants, Equipment, Apparatus, Tools, Materials, *Metals, Acids, Radioactive wastes.

Identifiers: Retrievable storage, Decontamination, Waste burial.

The extensive operations in AEC facilities that handle plutonium have resulted in the accumulation of large quantities of waste contaminated by alpha-active elements, particularly plutonium. Although much of this waste is combustible and can also be reduced in volume by compaction, a significant volume of waste is in the form of metallic equipment such as machinery, tools, enclosures, etc. The program concerns methods by which these metals can be salvaged. The effort during the present period has been directed toward a review of existing information on the decontamination of metals. The results of this review are summarized. W75-03417

STORAGE OF TRITIUM AND NOBLE GASES,
Argonne National Lab., Ill.
L. E. Trevorrow.
In: Argonne National Laboratory Waste Management Programs Quarterly Report, October-December, 1973. Report No ANL-8087, p 20-29, February 1974. 1 fig, 3 tab.

Descriptors: *Waste treatment, *Nuclear wastes, *Tritium, Separation techniques, Research and development, Water pollution sources, *Reverse osmosis, *Membrane processes, Radioactivity, Hazards, Safety factor, Storage, Fuels, Public health, Costs, Economics, Regulation, Legal aspects, Governments, Administrative agencies.
Identifiers: *Fuel reprocessing wastes, *Noble gases.

The objective is to evaluate various techniques for the storage of tritium and noble gas fission products. The scope of the program includes evaluations of proposed storage techniques and techniques for the concentration of the desired nuclides. Recent efforts have included evaluations of proposed techniques for concentrating tritiated wastes. An Evaluation is presented of the possibility of concentrating tritiated water by reverse osmosis (RO). (See also W75-03415) (Houser-ORNL)

RECOMMENDED METHODS OF REDUCTION, NEUTRALIZATION, RECOVERY, OR DISPOSAL OF HAZARDOUS WASTE. VOLUME IX, NATIONAL DISPOSAL SITE CANDIDATE WASTE STREAM CONSTITUENT PROFILE REPORTS - RADIOACTIVE MATERIALS,
TRW Systems Group, Redondo Beach, Calif.
R. S. Ottinger, J. L. Blumenthal, D. F. Dal Porto, G. I. Gruber, and M. J. Santy.
Available from NTIS, Springfield, Va, 22161 as PB-224 588, $6.25 in paper copy, $2.25 in microfiche. Rept No EPA-670/2-73-053-i, August 1973. 166 p, 1 fig, 35 tab, 124 ref.

Descriptors: Radioactivity, Materials, *Radioactive waste disposal, *Profiles, Physical properties, Chemical properties, *Waste treatment, *Waste storage, Radioisotopes, Carbon, Cobalt, Ruthenium, Promethium, Strontium, Zirconium, Niobium, Iridium, Radium, Cesium, Hydrogen, Iodine, Krypton, Xenon, Plutonium, Americium, Curium, Cerium.
Identifiers: Alternative methods.

Summary information and evaluation of waste management methods in the form of Profile Reports for radioactive materials are presented. These Profile Reports were prepared for either a particular hazardous waste stream constituent or a group of related constituents. Each Profile Report contains a discussion of the general characteristics of the waste stream constituents, their toxicology and other associated hazards, the definition of adequate management for the waste material, an evaluation of the current waste management practices with regard to their adequacy, and recommendation as to the most appropriate processing methods available and whether the waste material should be considered as a candidate for National Disposal, Industrial Disposal, or Municipal Disposal. (Houser-ORNL)
W75-03426

GUIDELINES FOR THE INTERIM STORAGE OF AEC-GENERATED SOLID TRANSURANIC WASTES.
Los Alamos Scientific Lab., N. Mex.
Available from NTIS, Springfield, Va 22161 as Rept No LA-5645, $5.45 in paper copy, $2.25 in microfiche. Report No LA-5645, June 1974. 70 p, 1 tab, 12 ref.

Descriptors: *Radioactive waste disposal, Wastes, Management, *Waste storage, Technology, *Safety, Safety factors, Evaluation, Assessment, Toxicity, Public health, Methodology, Solids, *Waste disposal, Solid wastes, *Waste treatment.
Identifiers: Guidelines, *Transuranic wastes, Retrievable storage.

Guidelines have been developed to provide a basis against which to judge the adequacy of techniques and methods for the retrievable storage of AEC-generated transuranic-contaminated solid wastes. These guidelines apply to operations for packaging, handling, and storage of such wastes. Each guideline has been fully discussed with emphasis on the reasoning behind the guideline statement, problems that should be considered in developing a storage facility, and methods currently in use at AEC installations. WATER TREATMENT PLANT WASTES DISPOSAL-PART 2,
G. P. Westerhoff, and M. P. Daly.
Journal American Water Works Association, Vol 66, No 6, p 379-384, June 1974. 3 fig, 6 tab, 5 ref.

Descriptors: *Waste water treatment, *Waste disposal, *Sludge treatment, *Sludge disposal, Filtration, Coagulation, Centrifugation, Chemical precipitation, Evaluation.
Identifiers: *Alum.

The available alum-sludge treatment and disposal methods were evaluated by pilot plant studies so that the Sturgeon Point Water Treatment Plant could be improved in accordance with the Federal Water Pollution Control Act Amendments of 1972. Processes evaluated included alum recovery, recycling of recovered alum, pressure filtration, scroll centrifugation, basket centrifugation, vacuum filtration, chemical coagulation, a belt-filter-press system, and artificial freeze-thaw. The processes or combinations of processes most feasible at the Sturgeon Point Plant are pressure filtration, precoat rotary-vacuum filtration, scrool centrifugation, freeze-thaw plus vacuum filtration, and alum recovery plus horizontal vacuum filtration. TEMPERATURE-SUBSTRATE INTERACTIONS IN BIOLOGICAL TREATMENT,
Missouri Univ., Columbia. Dept. of Civil Engineering.
J. T. Novak.
Journal Water Pollution Control Federation, Vol 46, No 8, p 1984-1994, August 1974. 12 fig, 3 tab, 23 ref.

Descriptors: *Biological treatment, *Waste water treatment, Kinetics, *Aerobic treatment, *Anaerobic treatment, Temperature.
Identifiers: Arrhenius equation.

Temperature correction factors are used in biological waste treatment processes to modify microorganism growth rates or substrate utilization rates to correspond to variations in the temperature. The modified Arrhenius equation is usually used to characterize the temperature correction for these modifications. The temperature response of biological processes was found to depend on the substrate concentration present in the system. Therefore, the applicability of the Arrhenius equation is limited because one of its factors (the temperature coefficient) is substrate dependent. Aerobic processes were nearly independent of temperature variations at low substrate levels and anaerobic processes were dependent on temperature at all substrate levels. Although temperature models provided reasonable descriptions of process response, they must be used with care, keeping in mind the fact that temperature can affect the organism yield coefficient and decay rate, the dominant organism groups and the availability of nutrients, which in turn can alter the kinetic response. The following basic temperature model clarifies the temperature-substrate relationship present in biological waste treatment systems: for aerobic degradation both k and Ks increase logarithmically with increased temperature; for anaerobic decay k increases logarithmically with increased temperature and Ks decreases logarithmically with increased temperature. (Orr-FIRL)

WASTEWATER DEGASSING BY ADIABATIC FLASHING,
New Mexico State Univ., University Park. Dept. of Chemical Engineering.
D. B. Wilson, and H. Y. Tsao.
Journal Water Pollution Control Federation, Vol 46, No 9, p 2209-2214, September, 1974. 3 fig, 1 tab, 11 ref.

Descriptors: *Separation techniques, *Flash distillation, *Waste water treatment, Gases, Aqueous solutions, Industrial wastes, Domestic waste, Equipment, Costs, Economics, Mathematical studies, Algorithms.
Identifiers: *Adiabatic flashing.

Aqueous solutions of dissolved gases can result from a variety of industrial and water treatment operations such as the production of oil from petroleum, domestic waste water treatment, petroleum refining, hydroelectric production, fish farming operations, and the scrubbing of power plant stack gases. The dissolved gases must be removed before the water is released to the environment if the gaseous components are corrosive or toxic to the biological life in the water system. These gases can be physically separated either by stripping or flashing. Adiabatic flashing is recommended because the equipment is relatively simple, a short residence time for phase separation is provided and eliminates mist entrainment, the gaseous solute produced is in a high concentration, and the discharge temperature of the water steam is lowered. A mathematical analysis of adiabatic flashing was performed. The analysis indicated that if the quantity and condition of the feed, adiabatic operation, and the flash temperature are specified, all the other design variables may be calculated by using the system material and energy balances. The design variables include the pressure of the flash, and the ratio of the quantity of gas phase produced to the quantity of feed. The recommendation of adiabatic flashing is based on the results of the analysis, an estimation of economic costs based on equipment prices, and estimated operating costs. (Orr-FIRL)

A PROGRAM FOR THE FUTURE--WATER AND SEWER IN RURAL AMERICA.
Commission on Rural Water, Washington, D.C.
April 1974. 20 p, 22 photo.

Descriptors: *Sewage, *Sewage treatment, *Water quality control, Water pollution sources, Groundwater resources, Virginia, West Virginia, South Carolina, Arkansas, New Mexico, Florida, Water pollution control, *Waste water treatment, Water supply, Water wells, Water table, Water resources, Potable water, Water quality, Federal government, State governments, Water pollution.

Providing an adequate water supply is a major problem for rural communities in America. Studies conducted by various federal agencies show extensive contamination of rural public water sources as well as private water sources. Contamination usually results from improper septic fields. The National Demonstration Water Project (NDWP) was an outgrowth of the Demonstration Water Project (DWP). DWP was set up to supply water to five rural counties near Roanoke, Virginia. The Roanoke project was very successful, so the Office of Economic Opportunity established a similar national program in 1971. NDWP has six affiliate projects in Virginia, West Virginia, South Carolina, Arkansas, New Mexico and Florida. The purpose of NDWP is to design and test models of rural water-sewer projects, to gather and disseminate information and technical expertise, and to expand water-sewer facilities in rural areas. The NDWP includes coordination and project assistance, research and publications, an information clearing house and a management and technical assistance program. (Barnes-Florida)

THE USE OF POLLUTANTS FOR AQUACULTURE - CONDITIONING OF WASTES FOR AQUACULTURE,
Papua and New Guinea Univ., Port Moresby (New Guinea).
G. L. Chan.
In: Indo-Pacific Fisheries Council Proceedings, 15th Session, Wellington, New Zealand, October 18-27, 1972. Section II: Coastal Aquaculture and Environment, Bangkok, 1974. p 84-91. 2 fig.

Descriptors: *Farm wastes, *Sewage treatment, Algae, Self purification, *Aquiculture, Organic wastes, *Domestic wastes, *Biodegradation, Sewage bacteria, Sewage disposal, Aquatic microorganisms, Bacteria, Environmental sanitation, *Biological treatment, Water reuse, Biochemical oxygen demand, Fertilization, Waste water treatment.

The conditioning of human and animal wastes for use in aquaculture is described. The processes are sanitary and scientific and produce as by-products, fuel such as methane gas, feed in the form of algae, and plant fertilizer. The organic matter is digested by bacteria, producing methane, allowing the settling of cellulose and destroying parasites. The effluent is then further purified by algae. At this stage the effluent is then further purified by algae. At this stage the effluent may be used in aquaculture. The water finally leaving the system will contain only minerals. A design for the unit is presented. (Katz)

SEWAGE AND AQUACULTURAL PRODUCTION,
Victoria Univ., Wellington (New Zealand).
E. B. Slack.
In: Indo-Pacific Fisheries Council Proceedings, 15th Session, Wellington, New Zealand, October 18-27, 1972. Section II: Coastal Aquaculture and Environment, Bangkok, 1974. p 70-75, 17 ref.

Descriptors: *Aquiculture, *Salmonids, *Fertilization, *Sewage treatment, *Biodegradation, *Waste water treatment, Rainbow trout, Water reuse, Sewage lagoons, Farm wastes, Smelts, Sewage effluents, Sewage disposal, Food chains, *Tertiary treatment.
Identifiers: Goldfish.

Experiments on a sewage stabilization pond are described in which rainbow trout have been successfully cultivated together with wild goldfish, eels, and common smelt. Weight gains of up to twenty-fold for rainbow trout in a six-month period and thirty fold for the goldfish have been obtained in a ten-month period. The author suggests the need for changing the attitude toward sewage wastes and in particular their effect on the environment of rainbow trout and other salmonids. (Katz)

MUNICIPAL WASTES - A DESIGN FOR AN INTEGRATED PLANT TO MAKE A PROFIT,
New South Wales Univ., Kensington (Australia). School of Chemical Engineering.
C. H. Hunt, and R. F. Terpstra.
Australian Chemical Engineering, Vol 15, No 9, p 9-16, September 1974. 4 tab, 15 ref.

Descriptors: *Municipal wastes, *Waste disposal, *Water reuse, Economics, *Australia, Sludge disposal, Sewage disposal, Alcohols, Recycling, *Costs, Profit, Cities, Cellulose, Capital costs.

The currently accepted methods of garbage disposal in Australia - dumping and burial - are rapidly becoming unacceptable both in terms of cost and environmental quality. A plan suitable for garbage disposal for a city of about 400,000 people is proposed whereby cellulose pulp extracted from refuse is used as a raw material for acid hydrolysis, fermentation and distillation to yield ethyl alcohol. The water requirements for the plant are provided by sewage water purification, and the sludge derived from water treatment at the input and output stages may be dried and used as fuel for the plant. On the basis of market prices in 1972-3, and allowing for capital and fixed costs, it is estimated that a profit of about $15 per ton of refuse treated could result from the sale of ethyl alcohol and other reclaimed materials such as crushed glass, metals and plastics, and fertilizers. ALUM RECOVERY FROM WATER AND WASTEWATER TREATMENT PLANT SLUDGES,
Virginia Polytechnic Inst. and State Univ., Blacksburg.
B. H. H. Chen.
Available from Xerox University Microfilms, Ann Arbor, Mich. 48106, Order No 74-14,485. PhD Thesis, 1974, 146 p.

Descriptors: Investigations, Alum, *Sludge treatment, Economics, *Waste water treatment, Treatment facilities, Hydrogen ion concentration, *Water treatment.
Identifiers: *Alum recovery.

The extent of alum recovery achievable is defined, the effectiveness of recovered alum is demonstrated, and the properties of the remaining sludge are characterized. The economy of the alum recovery process in water and waste water treatment systems was also analyzed. Results showed that the amount of alum recovered can be controlled by noting the associated stoichiometric relationship and by pH measurement. An extensive cost analysis of the alum recovery technique developed in the laboratory was conducted with two illustrative problems demonstrating the economic advantage of this recovery process. Alum recovery and reuse may be a viable alternative to the conventional method of water and waste water treatment. (Sandoski-FIRL)

SOME EFFECTS OF NITROGEN AND PHOSPHORUS LIMITATION ON A BIOLOGICAL-CHEMICAL WASTEWATER TREATMENT PROCESS,
Michigan Univ., Ann Arbor.
Y. C. Wu.
Available from Xerox University Microfilms, Ann Arbor, Mich 48106, Order No 74-15,908. PhD Thesis, 1973, 219 p.

Descriptors: *Nitrogen, *Phosphorus, *Waste water treatment, *Waste treatment, *Biological treatment, Treatment facilities, Sludge treatment, Activated sludge, Laboratory tests, Efficiencies.
Identifiers: *Chemical treatment, Charge production.

The effect of nitrogen and phosphorus limitation on substrate removal, sludge productivity, biochemical behavior of sludge, and capsule and electric charge production on the surface of treatment organisms has been studied using two laboratory activated sludge units with heterogeneous populations. Experimental results indicate that the treatment efficiency of the biological-chemical process is highly dependent on the chemical nature of the waste to be treated. Also, an increase in sludge protein and sludge phosphorus content was observed as the sludge yield and carbohydrate content decrease. Finally, results of chemical flocculation studies showed that lower chemical doses per unit of effluent biological solids were required at high initial solids and low initial phosphorus conditions. The relationship between quantity of chemical precipitant and percentage of phosphorus removal was not a stoichiometric function. Indications are that following phosphorus removal there is a chemical separation of dispersed microorganisms. (Sandoski-FIRL)

THE SEWAGE SYSTEM OF THE CITY OF RANGOON,
G. P. Singh.
The Public Health Engineer, No 9, p 96, May 1974.

Descriptors: *Water supply, *Sewerage, *Sewers, Municipal wastes, Waste water treatment, Water utilization, History.
Identifiers: *Burma(Rangoon).

The existing sewerage system in Rangoon was installed in the year 1874 during the British regime; it covered an area of 3.4 square miles of central Rangoon, Burma. From 1915 to 1924 the system was extended, bringing the total area covered to 6.3 square miles. The remaining 44 suburbs have no sewerage at present, but are served with bucket and pit latrines. The contents of both collecting chambers flow into the main sewers which discharge into the eastern end of the Irrawaddy River. Municipal sewage is discharged into the main sewers by ejector stations at the roadside. Water consumption in the city is about 35 gallons per head per day or 70 million gallons per day. The supply is insufficient and authorities have begun the construction of a water reservoir project at Pugyi, 32 miles from Rangoon. (Sandoski-FIRL)

STATE OF THE ART-ACTIVATED CARBON TREATMENT OF WASTEWATER,
CH2M-Hill, Reston, Va.
L. G. Suhr, and G. L. Culp.

Water and Sewage Works, Vol 121, No 4, p 104-108, 110-112, April 30, 1974. 3 fig, 6 tab, 17 ref.

Descriptors: *Waste water treatment, *Activated carbon, *Tertiary treatment, Adsorption, Suspended solids, Waste treatment, *Reviews.
Identifiers: Physical-chemical treatment.

Currently there are two approaches for the use of granular activated carbon in waste water treatment. One approach is to use activated carbon in a tertiary treatment sequence following conventional primary and biological secondary treatment. Another approach utilizes activated carbon in a physical-chemical treatment (PCT) process in which raw waste water is treated in a primary clarifier with chemicals prior to carbon adsorption. Filtration and disinfection also may be included in PCT, but biological processes are not used. The PCT approach seeks to make maximum use of granular activated carbon by extending its function of removing refractory dissolved organics to adsorption of biodegradable organics as well. In some cases, the granular bed of carbon is used as a filter to remove suspended and colloidal materials. The capabilities of PCT must be evaluated in light of specific effluent quality requirements to determine its applicability. (Sandoski-FIRL)

A SLUDGE CAKE INCINERATION PROCESS AND AIR POLLUTION CONTROL SYSTEM,
Environmental Protection Agency, Chicago, Ill. Surveillance and Analysis Div.
P. Cho.
Water and Sewage Works, Vol 121, No 4, p 76-80, April 30, 1974. 2 fig, 4 tab, 4 ref.

Descriptors: *Design criteria, *Sewage treatment, *Treatment facilities, Equipment, Biochemical oxygen demand, Suspended solids, Sludge treatment, Simulation analysis, Computers, *Incineration, *Waste water treatment, *Kentucky.
Identifiers: Sludge cakes, *Air pollution control.

A study was completed in 1970 on basic design data for the proposed Secondary Treatment Facilities for Fort Southworth Sewage Treatment Plant in Kentucky. The proposed facility was designed to provide for a minimum BOD5 removal of 90 percent and to effect comparable suspended solids removal and peak flow disinfection. The following design alternative was accepted by the City of Louisville and Jefferson County: five trains of oxygenation tanks designed to operate with pure oxygen generated by on-site units; twenty final settling tanks; a return sludge pumping station; chlorination facilities and chlorine contact tanks; a final effluent pumping station; and a building containing sludge thickener tanks, sludge vacuum filters, chemical handling facilities, and three multiple hearth incinerators; and, miscellaneous structures and facilities. The sludge treatment phase using the Zimpro wet air oxidation units as well as computer simulation techniques employed are described. (Sandoski-FIRL)

SEWER PIPE: INFILTRATION IS THE ISSUE,
V. Fairweather.
Civil Engineering-ASCE, Vol 44, No 7, p 79-83, July, 1974. 4 fig.

Descriptors: *Pipes, *Sewers, *Infiltration, *Inflow, *Legislation, Repairing, Federal Water Pollution Control Act, Sewage treatment, Treatment facilities.

Due to the 1972 amendment of the Water Pollution Control Act, the infiltration/inflow rates to sewers are becoming an important consideration for applicants proposing new sewage treatment facilities. A three-phase procedure for complying with regulations requires a preliminary infiltration/inflow analysis, a sewer system evaluation survey, and sewer rehabilitation and/or construction or expansion of treatment plants. The problems, economics, and technology associated with this legislative requirement are reviewed. (Sandoski-FIRL)
W75-03548

A BASIC STUDY OF BIOLOGICAL NITRIFICATION AND DENITRIFICATION, (IN JAPANESE),
T. Yamanouchi, and K. Sugata.
Mitsubishi Heavy Industries Technical Review, Vol 11, No 3, p 87-95, May, 1974. 13 fig, 11 ref.

Descriptors: *Nitrification, *Denitrification, *Waste water treatment, Nitrogen, Nutrients, Eutrophication, *Biological treatment.
Identifiers: Biological nitrification, Biological denitrification.

Advanced ways of treating waste water and sewage are increasingly in demand, because of the phenomenon of eutrophication. The total removal of nitrogen is the most significant problem facing these treatments for nutrient removal. Biological nitrification and denitrification systems are investigated as nitrogen removal methods. Results are: biological nitrification and denitrification are subject to such environmental conditions as pH value and temperature; nitrifying bacteria and denitrifying bacteria are domesticated easily, and when these systems are considered as a total biological treatment system, the utilization of existing sewage and waste water treatment systems would be the most effective method. (Leibowitz-FIRL)
W75-03550

TREATMENT FOR OILY WASTE WATER USING MAGNETIC POWDER, (IN JAPANESE).
Water Purification and Liquid Waste Treatment, Vol 15, No 7, p 37-44, July, 1974. 9 fig, 7 tab, 3 ref.

Descriptors: *Waste water treatment, *Oily water, *Coagulation, Water pollution control, Flocculation, Sediments.
Identifiers: *Magnetic powder.

Chemical coagulation processes are often used to treat waste water that contains fine oil droplets. When these processes are performed by adding fine magnetic powder and suspending them in oily waste water layers, the produced flocks containing oil droplets include these magnetic powders. Coagulated flocks containing oil droplets, metal hydroxide and magnetic powder are tightened and sedimented in a magnetic field. These sediments are easily removed with the moving of the magnetic belt or rotation of the magnetic drum. (Leibowitz-FIRL)
W75-03551

STUDY OF THE REMOVAL OF COPPER ION AND CADMIUM ION FROM WASTE WATER BY FLOTATION METHOD UTILIZING XANTHATE, (IN JAPANESE),
Iwate Univ., Morioka (Japan). Dept. of Mining and Civil Engineering.
S. Hasebe, H. Sato, and Y. Sugata.
Report on Technology of Iwate University, No 26, p 41-46, November, 1973. 9 fig, 1 tab, 13 ref.

Descriptors: *Copper, *Cadmium, *Waste water treatment, *Flotation, Zinc, Water pollution, Ions.
Identifiers: *Xanthate, *Calcium carbonate, Ferric ions.

A small number of cadmium and copper ions are occasionally contained together with ferric and zinc ions in waste water. The removal of copper and cadmium ions from waste water by flotation using xanthate was investigated. Copper ion was easily removed as copper xanthate by adding about 2 or 3 equivalents of methyl or ethyl xanthate; cadmium ion was removed by adding 2 or 3 equivalents of butyl or amyl xanthate. The removal of the cadmium or copper ions was influenced by the peripheral speed of the impeller; the scum was stabilized by adding frother such as methyl iso-butyl carbinol. Copper or cadmium ions in artificial waste water were reduced by the secondary treatment method, from 10 mg/liter of copper and 1 mg/liter of cadmium ions to less than 0.1 mg/liter each. The co-existence of zinc and ferrous ions prevented the removal of copper and cadmium of xanthate salt from the waste water. Ferric ions must be turned into ferric hydroxide by adding calcium carbonate, because xanthate ion is oxidized by ferric ion when ferric ion is contained in waste water. (Leibowitz-FIRL)

URBAN RUNOFF AND COMBINED SEWER OVERFLOW, (LITERATURE REVIEW),
National Environmental Research Center, Edison, N.J. Edison Water Quality Research Div.
R. Field, and P. J. Szeeley.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1209-1226, June, 1974. 228 ref.

Descriptors: *Reviews, *Overflows, *Storm runoff, *Storm water, *Urban runoff, Combined sewers, Water pollution sources, Management(Applied), Control systems, Flow characteristics, Infiltration, Storage, *Waste water treatment, *Bibliographies.

As significant contributors to water pollution, stormwater runoff and combined sewer overflows have become increasingly important to the Environmental Protection Agency as an area for concern and control. Reviewed are the characteristics of stormwater runoff and various management practices such as control systems, flow models, soil infiltration and runoff predictions. The control of combined sewer overflows, infiltration, storage, and the beneficial use of stormwater are outlined. Finally, the various treatment methods for stormwater and combined waste water are presented. (Sandoski-FIRL)

THE USE OF AEROBIC PROCESSES FOR THE STABILIZATION OF ANIMAL WASTES,
North of Scotland Coll. of Agriculture, Aberdeen.
K. Robinson.
Critical Reviews in Environmental Control, Vol 4, No 2, p 193-220, July 31, 1974. 4 fig, 1 tab, 130 ref.

Descriptors: *Waste water treatment, *Reviews, *Bibliographies, Agriculture, *Aerobic treatment, Agricultural runoff, *Farm wastes, Oxidation lagoons, Farm lagoons, Aerated lagoons, Oxygen, Oxygen demand, Biological oxygen demand, Microorganisms, Temperature, Hydrogen ion concentration, Hogs, Poultry.
Identifiers: *Composting, Beef, Oxygen transfer.

During the last two or three decades there has been a shift in agricultural practice from relatively small quantities and wide distribution of agricultural wastes to specialist intensive enterprises in which animal and crop production are separate and the resulting wastes are therefore more concentrated. The various aerobic methods for treating agricultural wastes such as the oxidation pond, the barrier ditch, the aerated lagoon, the aerated basin, and composting are reviewed. The advantages and disadvantages of these systems are discussed and ten areas for further research are offered. (Orr-FIRL)
W75-03555

THE THREE SLUDGE SYSTEM FOR NITROGEN AND PHOSPHORUS REMOVAL,
Federal Water Quality Administration, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
M. C. Mulbarger.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-213 778, $4.25 in paper copy, $2.25 in microfiche. April, 1972. 57 p, 16 fig, 29 ref.

Descriptors: *Waste water treatment, *Phosphorus, *Nitrogen, Activated sludge, Water pollution treatment, Waste treatment, Sewage treatment, Tertiary treatment, Pilot plants, Carbon, Nitrification, Denitrification, *Sludge treatment.
Identifiers: Phosphorus removal, Nitrogen removal, *Three sludge system.

The three sludge (carbon removal, nitrification and denitrification) system with alum added was evaluated for the effectiveness of phosphorus and nitrogen removal. Eight months of performance data from a pilot plant were obtained. The data included measurements of pH, temperature, substrate concentration, COD removal, phosphorus removal, nitrification and nitrogen removal, solids production, solids characteristics, effluent suspended solids, nitrification inhibition, alkalinity losses, dissolved solids introduction, aeration and mixing requirements, chemical addition, clarifiers, solids wasting, spray water, disinfection, instrumentation, and costs. The following conclusions were made: the three sludge system is preferred over other biological nitrogen removal systems; nitrification and denitrification are temperature dependent and are pH dependent in nonacclimated cultures; phosphorus removal to a high level can be easily obtained with split alum addition and pH optimization; good removals of soluble COD and carbonaceous BOD5 are achieved with two-stage nitrification system; negative or small solids production values occur in the nitrification system and the values are temperature dependent; and alkalinity dependent addition for the pH optimization should be automated to insure maximum system dependability. (Leibowitz-FIRL)
W75-03556

PHOSPHORUS REMOVAL PRACTICE.
Environmental Protection Agency, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-214 059, $3.75 in paper copy, $2.25 in microfiche. Presented at the Sanitary Engineering Inst., Madison, Wis., 9-10 Mar 71. (1971). 28 p, 8 fig, 13 tab, 21 ref.

Descriptors: *Phosphorus, *Sewage treatment, Activated sludge, Trickling filters, *Tertiary treatment, *Waste water treatment, Sanitary engineering, Treatment facilities.
Identifiers: Phosphorus removal, Chemical treatment.

A limited number of phosphorus removal processes are discussed. Only those processes which utilize chemical additions because of their economics and reliability, such as chemical treatment of raw degritted sewage, mineral addition, and tertiary treatment for phosphorus removal, are considered. The primary, secondary, and tertiary chemical addition techniques are illustrated by the use of results from specific treatment plants. Advantages and disadvantages are presented; each waste water has its own particular set of conditions and its own particular solution. (Orr-FIRL)
W75-03558

COMBINATION LIMESTONE-LIME TREATMENT OF ACID MINE DRAINAGE,
Environmental Protection Agency, Norton, W. Va. Norton Mine Drainage Field Site.
R. C. Wilmoth, R. B. Scott, and R. D. Hill.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-213 777, $3.25 in paper copy, $2.25 in microfiche. April, 1972. 22 p, 6 fig, 13 tab, 4 ref.

Descriptors: *Waste water treatment, *Mine drainage, *Acid mine water, *Neutralization, *Lime, *Limestones, Water clarification, Costs, Mine drainage, Mine wastes, Water pollution sources, Liquid wastes, Mine water.
Identifiers: *Combination limestone-lime treatment.

One of the most promising treatment methods for acid mine drainage is a combination limestone-lime neutralization. Testing at the Norton Mine drainage field in Norton, West Virginia showed that combination treatment obtained greater than 25 percent reduction in material cost for treatment of pH 6.5 as compared to lime of limestone treatment alone. Combination treatment also produced a sludge with solids content up to five times higher than sludge produced by lime neutralization. Combination treatment was almost as effective in clarification as lime and was more effective than limestone. The volume of sludge produced by the combination method was less than by that produced by using lime or limestone. The effluent waters produced by all three methods are of comparable quality. (Orr-FIRL)
W75-03559

SEWAGE TREATMENT IN THE CITY OF PLYMOUTH,
Plymouth Sewage Works (England).
G. E. Tucker.
Water Pollution Control, Vol 73, No 3, p 325-329, 1974. 2 fig, 5 tab.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Sludge treatment, Sludge disposal, Equipment, Sedimentation.
Identifiers: United Kingdom(Plymouth-Eng).

A discussion of the Camel's Head sewage works and the Plympton sewage works is presented. The Camel's Head process gives full treatment with heated sludge digestion with disposal by barge to the sea. When completed, the Plympton sewage works will be the largest of the city's treatment facilities, serving a population of 90,000. The sedimentation tanks of the old works were incorporated on the new works as storm tanks and space is available on the site to allow for doubling the size of the works if necessary. (Sandoski-FIRL)
W75-03561

METHOD OF BLEACHING WOOD PULP,
Atlantic Richfield Co., New York.
R. M. Lincoln, and J. A. Meyers.
Canadian Patent 949,263. Issued June 18, 1974. Canadian Patent Office Record, Vol 102, No 25, p 3, June 18, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, *Patents, Water pollution control, *Pulp wastes, Bleaching, Methodology.
Identifiers: Butyl hydroperoxide.

A method to prevent both atmospheric and water pollution in the pulp and paper industry is described. Under this process, pulping and bleaching of wood chips is accomplished in a single stage using tertiary butyl hydroperoxide in an aqueous alkaline medium. (Sandoski-FIRL)
W75-03562

SEWAGE TREATMENT SYSTEM,
H. G. Long, and V. E. Long.
United States 3,819,054. Issued June 25, 1974. Official Gazette of the United States Patent Office, Vol 923, No 4, p 1378, June 25, 1974. 1 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Equipment, *Patents, Septic tanks, Weirs.
Identifiers: Float skimmer, Air diffuser.

A sewage treatment system especially adapted to be a conversion unit for existing septic tanks is comprised of the following equipment. An inner tank to receive raw sewage is within the septic tank and spaced from the walls with its upper surface open above the liquid line. An air diffuser system delivers compressed air within the inner tank and draws activated solid portions settline from the clarifier zone in the outer tank toward the sludge zone at the bottom and through the slot in the inner tank into the aeration zone for further aeration treatment, with a final venotched weir discharge means attached to the outer wall of the inner tank. Lastly, a float skimmer means is provided to insure the return of floating solids from the clarifier zone to the interior of the inner tank for retreatment. (Sandoski-FIRL)
W75-03563

AEROBIC BIOLOGICAL STABILIZATION OF SANITARY LANDFILL LEACHATE,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
E. Foree, and E. Cook.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-214 194, $3.25 in paper copy, $2.25 in microfiche. September 1972. 43 p, 3 fig, 7 tab, 13 ref.

Descriptors: *Aerobic treatment, *Biological treatment, Sewage treatment, *Activated sludge, *Leachate, Leaching, Chemical oxygen demand, Water quality, *Waste water treatment, *Landfills, Kentucky.

Treatments of raw sanitary landfill leachate by aerobic biological processes and by combinations of chemical and physical processes were evaluated. Also effluent polishing was evaluated and chemical and physical characteristics of the leachate and treated effluent were determined. Activated sludge units with a 10-day retention time were most effective in removing COD. Ninety-seven percent COD removal efficiency could be obtained by activated sludge treatment alone. In combination with effluent polishing, activated sludge treatment could obtain more than 99 percent COD removal efficiency. The physical-chemical treatment methods were not effective in treating raw leachate. (Orr-FIRL)
W75-03564

OPERATING EXPERIENCE AND DESIGN CRITERIA FOR 'UNOX' WASTEWATER TREATMENT SYSTEMS, DESIGN SEMINAR FOR WASTEWATER TREATMENT FACILITIES.
Union Carbide Corp., Tonawanda, N.Y. Linde Div.
Report prepared for Environmental Protection Agency, Washington, DC, Technology Transfer Program, for seminar at New York, NY, February 29-March 2, 1972. 68 p.

Descriptors: *Waste water treatment, *Activated sludge, *Oxygenation, Oxygen, Safety factors, Design, Costs, Sewage treatment, *Design criteria, Operations.

The 'UNOX' system for waste water treatment is described. This system utilizes a covered and staged oxygenation basin for contact of oxygen gas and mixed liquor. High purity oxygen is introduced in the first stage and flows concurrently with the waste being treated. Mass transfer and mixing within each stage is performed either by surface aerators or by a submerged turbine rotating sparge system. The number of stages and parallel biological reactors and the type of mass transfer device used depend on waste characteristics, plant size, land availability, treatment

requirements and more. Operating data and experience, process design, process safety, the 'UNOX' system scope of supply, and economic considerations are also discussed. (Orr-FIRL)

INTERNAL POLLUTION CONTROLS IN THE PULPING INDUSTRY,
EKONO, Seattle, Washington.
H. Edde, and E. Sebbas-Bergstrom.
Journal Water Pollution Control Federation, Vol 46, No 11, p 2593-2603, November 1974. 7 fig, 7 tab, 16 ref.

Descriptors: *Pulp wastes, *Bleaching wastes, Pulp and paper industry, *Pollution abatement, *Costs, Waste water(Pollution), Water consumption, Industrial water, *Waste water treatment, Water conservation, Water reuse, *Industrial wastes, Wastes, Biochemical oxygen demand, Chemical oxygen demand, Systems analysis, Organic loading, Water pollution sources, Economic justification.
Identifiers: *Kraft mills, Scandinavia, Pulp washing.

Internal process control measures for controlling pulp mill pollution and reducing materials wastage include increased pulp washing, closing the brown stock screening system, new bleaching process, improved condensate handling, and spill collection. These measures are exemplified in recent Scandinavian installations. The overall treatment costs to meet various final discharge limits in a bleached kraft mill are examined for different combinations of internal and external control measures. Compared with a conventional bleached kraft mill discharging raw BOD loads of 70-100 lb/air-dried ton of pulp, (35-50 kg/metric ton), a raw BOD load of about 30 lb/air-dried ton (15 kg/metric ton) may be reached in an 'advanced mill' using the described internal controls. The total cost to reach the same value by external treatment is about twice the cost of internal controls. (Witt-IPC)

REMOVAL OF ARSENIC FROM EFFLUENT SLUDGES OF SULFATE AND OF PULP AND PAPER PRODUCTION (UDALENIE MYSH'YAKA IZ SHLAMOV SERNOKISLOTNOGO I TSELLYULOZNO-BUMAZHNOGO PROIZVODSTVA),
V. M. Kosover.
Khimiya i Khimicheskaya Tekhnologiya, Vol 16, No 12, p 1865-1867, 1973. 3 fig, 7 ref.

Descriptors: *Arsenic compounds, *Sludge treatment, Heavy metals, *Pulp wastes, *Sulfates, *Leaching, Hydrogen ion concentration, *Industrial wastes, Water pollution sources, Toxicity, Suspended solids, Dissolved solids, Alkalis(Bases), *Waste water treatment.

Effluent sludges or slurries from the manufacture of sulfates and of pulps and papers usually contain relatively high concentrations of arsenic compounds, such as arsenic trioxide, trisulfide, and heavy metal arsenates. Leaching such sludges with hydrochloric acid gives incomplete As removals and, moreover, gives rise to toxic volatile arsenic trichloride. Leaching with an alkali, such as NaOH, on the other hand, converts all As compounds into soluble forms. Optimum operating conditions were established to include 2 hr of reaction at 80-90C at a liquor/solids ratio of 15-20:1, using 2-3% alkali. Leaching with NaOH solution has the advantage of a lower apparent energy of activation, compared to sodium carbonate solution. (Chern-IPC)

TREATMENT OF INDUSTRIAL EFFLUENTS BY FLOTATION (TRAITEMENT D'EFFLUENTS INDUSTRIELS PAR FLOTTATION),
Societe Generale d'Epuration et d'Assainissement Degremont, Suresnes (France).
R. Treille.
Revue ATIP (Association Technique de l'Industrie Papetiere), Vol 28, No 4, p 197-200, 1974. 3 fig.

Descriptors: *Pulp wastes, *Water pollution treatment, *Treatment facilities, *Waste water treatment, *Waste treatment, *Flotation, *Flocculation, *Aeration, Suspended solids, Recirculated water, Filters, Filtration, Chlorination, Sedimentation, Chemicals, Pilot plants.

Recent advances in flotation equipment for removal of suspended solids from industrial effluents are discussed. Particular attention is focused on a process in which paper industry waste waters are aerated with compressed air and fed through a two-stage apparatus designed to form fine bubbles within floating flocks or particle aggregates while avoiding the formation of larger bubbles. Excellent flotation yield is reported at a speed five times that of a sedimentation unit while requiring less chemical consumption. Pilot-plant studies with this process in a paper mill using recirculated water resulted in the development of an effluent-treatment facility having a capacity of 250 cu m/hr which includes a coagulation-flocculation unit, a flotation unit, a battery of filters, and a prechlorination station. (Speckhard-IPC)

A REVIEW OF TURBIDITY REMOVAL ASSOCIATED WITH BIOLOGICAL TREATMENT OF PAPER MILL WASTEWATERS,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
H. Costa.
NCASI Stream Improvement Technical Bulletin, No 274, April 1974. 55 p, 26 fig, 24 tab, 40 ref.

Descriptors: *Turbidity, *Colloids, Waste treatment, *Biological treatment, *Pulp wastes, *Activated sludge, *Aerated lagoons, Oxidation lagoons, Adsorption, Flocculation, Nutrients, Temperature, Water temperature, Waste water(Pollution), *Waste water treatment, Biochemical oxygen demand, Reviews.

A survey is presented of published literature, unpublished studies, and field tests regarding the removal of turbidity-causing colloid particles in paper mill effluents by means of aerobic biological treatments. Both the activated sludge and the aerated stabilization basin process remove turbidity through a mechanism involving bio-adsorption and flocculation. The efficiency of colloid removal is improved by (a) temperatures above 15-18 C, (b) nutrient additions sufficient to support maximum BOD removal, and (c) high-rate systems, such as activated sludge treatment. (Buchanan-IPC)
W75-03574

SLIME CONTROL COMPOSITIONS AND THEIR USE,
Betz Labs., Inc., Trevose, Pa. (assignee)
B. F. Shema, R. H. Brink, Jr., and P. Swered.
US Patent No 3,829,424. Issued Aug 13, 1974. 4 p, 3 tab.

Descriptors: *Slime, *Pesticides, *Waste water treatment, *Industrial water, *Water conservation, *Recirculated water, *Pulp and paper industry, Organic compounds, Bromine, Freshwater, Closed circuits, Additives, Chemicals.
Identifiers: Slimicides, White water(Paper machine).

A slimicidal mixture of bromonitrostyrene and cetyl pyridinium bromide can be added to the white water system of paper machines, notably those conserving freshwater by full or partial closure of the water circuit, to prevent or control the formation of bio-organic deposits. (Lynch-IPC)
W75-03575

PEAT: NEW MEDIUM FOR TREATING DYE HOUSE EFFLUENT,
Hussong-Walker-Davis Co. Cornwells Heights, Pa.
M. E. Leslie.
American Dyestuff Reporter, Vol 63, No 8, p 15-16, 18, August 1974. 6 fig, 2 tab.

Descriptors: *Dyes, *Heavy metals, *Waste water treatment, Waste treatment, *Chemical wastes, *Textiles, *Peat, Pollution abatement, Effluents, Industrial wastes, Color, Turbidity, Chemical oxygen demand, Biochemical oxygen demand, Phosphates, Suspended solids, Cadmium, Chromium, Copper, Iron, Lead, Nickel, Zinc, Mercury, Metals, Operating costs, Filtration, Filters, Solids contact processes.
Identifiers: *Antimony.

A recently developed process for removing pollutants from textile dye house effluents is based on the scrubbing action of a moving mat of peat as the effluent is passed through it. In tests performed on actual dye house effluents with an operational water treatment system (not in a laboratory but under carefully controlled conditions), color was reduced by as much as 99.6%, turbidity by 100%, COD by 98.7%, BOD by 95%, total oxygen demand by 87.8%, phosphates by 97.7%, and suspended solids by 98.1%. The removal of heavy metal pollutants (Cd, Cr, Cu, Fe, Pb, Ni, Zn, Sb, and Hg) was virtually complete. The spent peat, which is the only by-product of the process, can be disposed of in a sanitary landfill or may be dried and burned. Operating costs, when treating textile dye effluent, range from 7 to 14 cents/1000 gal. (Witt-IPC)
W75-03577

LIGHT-ENERGIZED OXIDATION OF ORGANIC WASTES,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
J. W. Sargent, and R. L. Sanks.
Journal Water Pollution Control Federation, Vol 46, No 11, p 2547-2554, November 1974. 9 fig, 15 ref.

Descriptors: Waste treatment, *Chemical degradation, Waste water(Pollution), Pollutants, *Organic wastes, *Waste water treatment, *Radiation, Light, Dyes, Organic compounds, *Industrial wastes, Energy, Anaerobic conditions, Aerobic conditions, Kinetics, Laboratory tests, Phenols, Chemical reactions, Oxidation, Aqueous solutions, Chemical wastes.
Identifiers: *Photooxidation, Methylene blue, Photodegradation, Photochemistry, Reaction mechanisms, Reaction kinetics, *Cresol.

Laboratory studies indicate that a refractory organic substance (cresol) in aqueous solution can be destroyed by photooxidation, a process that uses visible light as a direct energy source. Methylene blue is an effective photosensitizer for cresol. Optimum initial concentrations for the dye and the cresol were determined. The reaction rate at which the photooxidation process proceeds can be roughly described by first-order kinetics, although the reaction mechanism is probably not simple first-order. The reaction proceeds 2.8 times faster in an aerobic than in an anaerobic environment. The significant amount of cresol photooxidation

achieved indicates that photooxidation has potential as a waste treatment process and merits further study and development. (Witt-IPC)
W75-03578

MODIFIED CELLULOSE ADSORBENT FOR REMOVAL OF MERCURY FROM AQUEOUS SOLUTIONS,
Bureau of Mines, Salt Lake City, Utah. Salt Lake City Metallurgy Research Center.
V. N. Marchant.
Environmental Science and Technology, Vol 8, No 12, p 993-996, November 1974. 3 fig, 2 tab, 4 ref.

Descriptors: Waste treatment, *Mercury, *Water purification, *Cellulose, *Separation techniques, Waste water treatment, Adsorption, Water pollution, Metals, Pollutants, Water pollution control, Heavy metals, Sulfur compounds, Inorganic compounds, Organic compounds.
Identifiers: Cellulose derivatives, Adsorbents.

Inorganic mercury was selectively removed from aqueous solution over a pH range of 1-9 by a modified cellulose adsorbent containing vicinal thiol groups. The amounts of mercury removed from solution were dependent on the flow rate. When a solution containing 1 ppm mercuric ion was passed through a column (10 mm inside diameter by 23 mm) prepared from 0.5 g of the cellulose derivative at an initial flow rate of 50 ml/hr, the mercury concentration in the effluent remained below 5 ppb for 60 bed volumes. (Witt-IPC)
W75-03579

SOME ASPECTS OF TREATMENT AND DISPOSAL OF BIOLOGICAL AND NON-BIOLOGICAL SLUDGES OF THE PAPER AND BOARD INDUSTRY (EINIGE ASPEKTE DER BEHANDLUNG UND BESEITIGUNG VON BIOLOGISCHEN UND NICHTBIOLOGISCHEN SCHLAEMMEN DER PAPIER- UND KARTONINDUSTRIE),
Cellulose Attisholz A.G., Solothurn (Switzerland).
H. Scherler.
Wochenblatt fuer Papierfabrikation, Vol 102, No 9, p 315-324, May 15, 1974. 7 fig.

Descriptors: Water types, *Sludge treatment, Sludge disposal, *Dewatering, Treatment facilities, Equipment, *Pulp wastes, *Waste water treatment, Filters, *Filtration, Centrifugation, Europe, Pulp and paper industry, Economics, Waste disposal, Cost-benefit analysis, Costs, Operating cost, Industrial wastes.
Identifiers: *Switzerland.

Described are the amounts of sludge produced in various kinds of paper industry effluent treatment plants; different types of water in sludges (interstitial, capillary, adsorptive, etc.); sludge thickening and dewatering methods and equipment; sludge pretreatment (preconditioning by chemical and/or thermal methods); and engineering calculations and cost-benefits analyses for sludge treatment and disposal. The relative efficiencies of various dewatering machines are illustrated, notably vacuum and pressure filters, such as the vertical tower filter press, the horizontal Sandritz dewatering press, and the conical-cylindrical screw decanter (centrifuge). How economically these machines are being used at two Swiss paper mills (Biberist and Utzenstorf) is illustrated by detailed cost figures. (Speckhard-IPC)
W75-03580

METAL SALTS OF DITHIOCARBAMIC ACID DERIVATIVES, THEIR MANUFACTURE AND USE (METALLSALZE VON DITHIOCARBAMIDSAEURE-DERIVATEN, DEREN HERSTELLUNG UND VERSENDUNG),
Buckman Labs., Inc., Memphis, Tenn.
H. D. Buckman, and J. D. Pera.
German Patent (Offenlegungsschrift) No 2,308,807. Nov 8, 1973. 30 p, 8 tab.

Descriptors: *Pulp wastes, *Slime, *Waste water treatment, *Water conservation, *Pesticides, Chemicals, Closed conduits, Pulp and paper industry, Industrial water, *Recirculated water, Sulfur compounds, Nitrogen compounds, Potassium compounds, Organic compounds, *Thiocarbamate pesticides, Carbamate pesticides.
Identifiers: Slimicides, White water(Paper machine).

Slime deposits in pulp and paper mill water systems, notably in closed circuits for conservation of freshwater, are controlled by introducing doses of microbicidal organic salts, such as potassium N-hydroxymethyl-N-methyl-dithiocarbamate. (Speckhard-IPC)
W75-03581

PROCESS FOR WASTE WATER PURIFICATION (VERFAHREN ZUM REINIGEN VON ABWASSER),
Casco A.B., Stockholm (Sweden).
E. S. Hecktor, H. Storstrom, and G. W. L. Eselbock.
German Patent (Offenlegungsschrift) No 2,308,815. Sept 6, 1973. 9 p, 2 tab.

Descriptors: *Chemical precipitation, Waste treatment, *Pulp wastes, *Suspended solids, *Flocculation, Sedimentation, *Flotation, Polymers, Additives, *Coagulation, *Waste water treatment, Hydrogen ion concentration, Mixing, Chemicals, Phenols, Polymers, Polyelectrolytes, Lignins, Carbohydrates, Fibers(Plant), Water purification.
Identifiers: Phenol-formaldehyde resins, Polyethylene oxide, Polyethers, Aluminum sulfate.

A process is provided for removing suspended solids from industrial waste waters, notably effluents of the paper, paperboard, and fiberboard industries which contain cellulosic fibers, fines, fillers, and dissolved lignin degradation products and hemicelluloses. The process involves the addition and dissolution of a phenol-formaldehyde resin in the waste water at an alkaline pH, followed by pH reduction through addition of aluminum sulfate or the like, until the resin precipitates while coprecipitating suspended solids. The precipitate is then separated by sedimentation or flotation. The agglomeration of phenolic resin flocs can be improved by mixing an aqueous solution of polyethylene oxide or other high-molecular-weight polyether with the resin. (Speckhard-IPC)
W75-03582

EFFECT OF BOD(5) LOADS AND CARBOHYDRATE CONCENTRATION ON WASTE WATERS ON THE DEVELOPMENT OF FILAMENTOUS BACTERIA (VLIYANIE NAGRUZOK PO BPK(5) I KONTSENTRATSII UGLEVODOV V STOCHNYKH VODAKH NA RAZVITIE NITCHATOI BAKTERII),
T. V. Zharova, and L. M. Abramova.
Gidroliznaya i Lesokhimicheskaya Promyshlennost', No 5, p 17-18, 1974. 2 tab, 5 ref.

Descriptors: *Organic loading, *Carbohydrates, Hydrolysis, *Fermentation, Industrial wastes, Waste water(Pollution), *Wood wastes, Waste treatment, *Waste water treatment, Activated sludge, *Biological treatment, *Bacteria, Aerated lagoons, Settling basins, Sedimentation rates, Sludge, *Biochemical oxygen demand, Treatment facilities, Foreign countries, Aquatic bacteria, Aeration, Nutrients.
Identifiers: Bacillus subcuticularis, Hydrolysis industry, Glucose.

Aqueous effluents of wood hydrolysis factories contain large amounts of organic materials, mostly unfermented carbohydrates, humins, furfural, and organic acids. During purification of these effluents, surges of filamentary bacterial growth are frequently observed which interfere with biological treatment, since they contribute to the swelling and poor sedimentation of activated sludge in secondary settling tanks. Filamentary growths are more common in media of lower organic loading. A systematic study of this phenomenon was conducted with a pure culture of Bacillus subcuticularis isolated from an aeration tank and grown in media containing 455 to 3300 mg/liter of 5-day BOD, viz., residual yeast-fermentation liquors supplemented with N and P compounds, with or without added glucose. In high-BOD media (2800-3300 mg/liter), only small cocci but no filamentary bacteria were observed, whereas filamentous growths occurred within 4 days in lower-BOD media (1400-1650 mg/liter) treated with glucose. At still lower BOD (650-850 mg/liter), filamentary bacteria developed even in the absence of glucose, although their growth was accelerated by glucose. To avoid such growths in aeration tanks, it is recommended to operate effluent treatment facilities at high BOD loadings and to reduce sugar concentrations in waste waters by more thorough prior fermentation. (Stapinski-IPC)
W75-03583

THE 'SHOCK ABSORBER' SYSTEM OF WASTEWATER TREATMENT,
J. W. Day.
Paper Processing, Vol 10, No 9, p 27-31, Sept 1974. 6 fig, 6 tab.

Descriptors: *Oxygenation, *Oxygen, *Activated sludge, Waste treatment, *Pulp wastes, *Aeration, *Waste water treatment, Economics, Biochemical oxygen demand, Biological treatment, Odor, Energy, Surges.
Identifiers: Unox(Oxygen-aided activated sludge) process.

Union Carbide Corp. pilot-plant studies led to the commercial development of the 'Unox' process, in which high-purity oxygen is used to aid activated sludge treatment of waste waters. Trial runs with effluents from bleached and unbleached kraft, sulfite, and groundwood/kraft combined pulp mills evidences BOD removals of 87% to 95%. Advantages claimed for the Unox process over plain air systems include reduced land area requirement, less off-gas odors, improved process control, better response to surges, and less power demand. (Hansen-IPC)
W75-03584

MILL EFFLUENT AND ITS UTILISATION FOR CROP CULTIVATION PURPOSES,
S. J. Khambatta, and C. M. Ketkar.
Paper (London), Vol 182, No 2, p 88, 90-91, July 17, 1974. 3 tab, 3 ref.

Descriptors: Treatment facilities, *Activated sludge, *Biological treatment, *Pulp wastes, Waste treatment, *Waste water treatment, *Irrigation, *Soil disposal fields, Landfills, Incineration, Agriculture, Crops, Crop response, *Effluents, Discharge(Water), Filtration, Soil bacteria, Percolation, Path of pollutants, Lignins, Carbohydrates, Nutrients, Plant growth, Dissolved solids, Suspended solids, Color, Sludge disposal.
Identifiers: India, Straw, Straw(Paper) mills.

An Indian mill producing mechanochemical pulp and fine papers, such as greaseproof and glassine, from rice straw, has installed a modern activated sludge effluent treatment facility. The treated effluent is suitable, according to regulations of the Indian Standards Institution, for irrigation of crop lands, while the dried sludge is used as landfill and/or domestic fuel. Effluent characteristics and the treatment installation are described. Large-scale irrigation experiments indicated that the lignins, polysaccharides, and residual nutrients

present in the treated effluent are not detrimental to the growth of paddy rice, sugar cane, groundnuts, vegetables, and other crops. On the contrary, increased plant yields indicate a beneficial effect. Color, dissolved solids, and suspended solids are appreciably reduced by soil percolation, filtration, and action of anaerobic soil bacteria. (Buchanan-IPC)
W75-03585

MEASUREMENTS OF SLUDGE LEVEL AND SLUDGE DENSITY IN CLARIFIER INSTALLATIONS (MESSUNGEN VON SCHLAMMNIVEAU UND SCHLAMMDICHTE IN KLAERANLAGEN),
Der Papiermacher, Vol 23, No 5, p 76-77, May 11, 1974. 2 fig.

Descriptors: *Instrumentation, *Sludge, *Treatment facilities, *Waste treatment, *Waste water treatment, Sedimentation, Flocculation, Storage tanks, Density, Measurement.

Two photoelectric instruments developed by the Siemens Co. in Germany are described and illustrated. One is designed to measure the sludge level, the other the sludge content (bulk or density) in waste water treatment basins. (Speckhard-IPC)
W75-03586

UNIQUE NEW SECONDARY OXYGEN TREATMENT SYSTEM FOR EFFLUENT,
Paper Trade Journal, Vol 158, No 31, p 22-23, Aug 5, 1974. 2 fig.

Descriptors: *Oxygenation, *Oxygen, *Treatment facilities, Waste treatment, *Waste water treatment, *Activated sludge, Equipment, Industrial wastes, Municipal wastes, Energy, Explosions, Safety, Oxidation, Mixing, *Pulp wastes, Pipelines.
Identifiers: Black liquors, Kraft mills, F30(Free-Fall Oxygenation) process.

The 'F30' (free-fall oxygenation) process developed by Airco Cryoplants Division of Airco Industrial Gases is based on an enclosed waterfall reactor for treating domestic and industrial waste waters with pure oxygen in activated sludge systems. The self-contained modular units require no tank covers, are easily installed in existing treatment facilities, and minimize explosion or combustion hazards. Their power consumption is low, and oxygen-utilization efficiencies of 90% or higher are reported. A special pipeline reactor suitable for oxidation of kraft mill black liquors has also been devised. (Hansen-IPC)
W75-03587

PULPING PROCESS PREVENTS POLLUTION,
R. A. Young.
Pollution Engineering, Vol 5, No 4, p 33-34, April 1973. 2 fig.

Descriptors: *Pollution abatement, *Washington, Columbia River, *Pulp wastes, Pulp and paper industry, Treatment facilities, *Sulfite liquors, Water quality, Waste treatment, *Waste water treatment, Calcium, Magnesium, Costs, Cost-benefit analysis, Employment, Economics, Biochemical oxygen demand.
Identifiers: Magnefite pulping process, *Chemical recovery.

When Washington State modified its water quality standards to require a 70% reduction in discharged effluent BOD, several sulfite pulp and paper mills along the Columbia River were faced with the decision of closing down, curtailing production, or altering their manufacturing technology to meet the stricter regulations. Two mills did shut down. At Camas, Washington, a 420 ton-per-day pulp mill of Crown Zellerbach Corp. was converted from the traditional calcium-base to a new magnesium-base sulfite cooking process. This 'Magnefite' process is described, including the method of recovering chemicals (sulfur and magnesium hydroxide) from the spent liquor. The Magnefite process meets both water and air quality codes, but has increased the mill's production costs, mainly by requiring 13 more employees. (Witt-IPC)
W75-03588

METHOD OF REDUCING THE DISCHARGE OF WASTE PRODUCTS FROM PULP MILLS,
Skogsagarnas Industri A.B., Vaxjo (Sweden). (assignee)
N. V. Mannbro.
U. S. Patent No 3,830,688. Issued Aug 20, 1974. 8 p, 1 fig.

Descriptors: *Pulp wastes, *Water conservation, *Bleaching wastes, *Industrial water, *Industrial wastes, *Waste water treatment, Lignins, Oxidation, Evaporation, Pulp and paper industry.
Identifiers: Kraft mills, Black liquors, Chemical recovery.

A method for reducing the freshwater consumption as well as the waste water discharge volume of pulp mills is described. It makes use of a nonoxidative pulping (chemical cooking) and an oxidative bleaching process. The cooked chips containing spent pulping liquor are passed from the digester to a brown stock washer where the liquor is washed out of the pulp with an aqueous solution containing volatile digestion residues from the spent liquor evaporation condensate. The undiluted pulp then passes directly to a high-density oxidative bleaching tower for further delignification and simultaneous oxidation of residual spent liquor chemicals, followed by an alkaline extraction stage. Liquor discharged from the brown stock washer can be combined with the alkaline extraction effluent and conveyed to a chemical recovery system. (Lynch-IPC)
W75-03590

REMOVAL OF TRACE METALS FROM WASTE WATER BY TREATMENT WITH LIME AND DISCARDED AUTOMOTIVE TIRES,
Canada Centre for Inland Waters, Burlington (Ontario).
A. Netzer, P. Wilkinson, and S. Beszedits.
Water Research, Vol 8, No 10, p 813-817, Oct 1974. 3 fig, 1 tab, 5 ref.

Descriptors: *Heavy metals, Water purification, *Lime, Waste treatment, *Waste water treatment, *Rubber, *Trace elements, *Adsorption, Liquid wastes, Aluminum, Cadmium, Chromium, Cobalt, Copper, Iron, Lead, Manganese, Mercury, Nickel, Zinc, Laboratory tests, Hydrogen ion concentration, Cations, Industrial wastes, Chemical wastes.
Identifiers: *Silver.

Laboratory experiments evaluated the feasibility of using discarded automotive tires in conjunction with lime to remove Al, Cd, Cr, Co, Cu, Fe, Pb, Mn, Hg, Ni, Ag, and Zn from aqueous solutions. The results showed that the groundup rubber is particularly useful as a polisher for removing final traces of metal after conventional lime treatment. It is as effective as activated carbon, cheaper, and easier to dispose of. Furthermore, the rubber reduces the amount of lime required which, in turn, leaves less sludge for dewatering and disposal. Better than 99% metal removal or less than 0.1 ppm residual metal concentration was achieved for Cd, Co, Mn, and Ni (pH 10-11), Al (pH 5-8), Cr (pH 5-11), Cu (pH 5.5-11), Fe (pH 3-11), Pb (pH 8-11), Hg (pH 4.5-11), Ag (pH 6-11), and Zn (pH 9-11). (Witt-IPC)
W75-03591

SYSTEM FOR RECOVERY OF FIBER FROM PAPER MILL EFFLUENT, INCLUDING A SIEVE BEND SCREEN,
Dorr-Oliver, Inc., Stamford, Conn. (assignee)
A. Boniface.
U.S. Patent No 3,833,468. Issued Sept 3, 1974. 14 p, 11 fig.

Descriptors: *Pulp wastes, *Industrial wastes, Waste treatment, *Waste water treatment, *Recycling, *Recirculated water, Suspended solids, *Fibers(Plant), Screens, Filters, Filtration, Waste water(Pollution), Equipment, Effluents, Pollution abatement.
Identifiers: White water(Paper machine effluent).

The various waste waters of a paper mill are collected in the form of a suspension which is passed under pressure through a sieve-bend screen. The function of the screen is to separate an overflow fraction containing long reuseable fibers from the underflow fraction which carries off other entrained solids. (Lynch-IPC)
W75-03592

BENEFICIATION OF LIGNIN SOLUTIONS AND PULP MILL WASTES,
Betz Labs., Inc., Trevose, Pa. (assignee)
K. R. Lange, A. M. Stern, L. L. Gasner, and Y. T. Hsu.
U. S. Patent No 3,829,388. Issued Aug 13, 1974. 5 p, 5 tab.

Descriptors: *Pulp wastes, *Industrial water, *Cooling water, *Boiler feed water, *Water treatment, *Lignins, *Corrosion control, *Scaling, Water softening.
Identifiers: Alkali lignins, Black liquors, Kraft lignin, Scale inhibitors.

A method for reducing scale and deposit formation in boiler feedwater, cooling water, and other aqueous industrial systems involves the addition of a sequestering agent derived from a soluble lignin derivative, such as alkali lignin obtained from kraft pulp black liquor. (Lynch-IPC)
W75-03593

SLIME CONTROL IN INDUSTRIAL WATERS,
Economics Lab., Inc., St. Paul, Minn. (assignee)
H. J. Hatcher, R. J. Truda, T. G. Lechner, and C. R. McDuff.
U. S. Patent No 3,824, 184. IssuedJuly 16, 1974. 5 p, 5 tab.

Descriptors: *Waste water treatment, *Industrial water, Closed circuits, *Slime, *Pesticides, *Enzymes, Pulp and paper industry, Chemicals, Additives, Recirculated water, *Pulp wastes.
Identifiers: Levan hydrolase, White water(Paper machine).

Pulp and paper mill water systems, notably closed circuits, can be protected against formation of slime deposits by adding suitable amounts of an enzyme preparation based on levan hydrolase. (Lynch-IPC)
W75-03594

METHOD OF DECOLORIZING WASTE PROCESS LIQUID DISCHARGED BY A PAPER MILL,
Owens-Illinois, Inc., Toledo, Ohio. (assignee)
H. C. Croom.
U. S. Patent No 3,833,463. Issued Sept 3, 1974. 8 p, 2 fig.

Descriptors: *Pulp wastes, *Lime, Waste treatment, *Waste water treatment, *Color, *Chemical precipitation, Calcium carbonate, Carbon dioxide, Hydrogen ion concentration, *Pulp wastes.

Aqueous effluents of pulp and paper mills are decolored by a chemical process comprising the following steps: (1) carbonation to neutralize the pH, (2) addition of lime mud to form soluble calcium bicarbonate in the presence of carbon dioxide, (3) repeated carbonation, (4) addition of lime to raise the pH and precipitate calcium carbonate, (5

treatment with carbon dioxide to reduce the pH and to form a carbonate with any remaining soluble calcium, and (6) removal of the precipitated calcium carbonate together with coprecipitated color bodies. (Lynch-IPC)
W75-03595

METHOD OF DECOLORIZING PAPER MILL EFFLUENT LIQUID,
Owens-Illinois, Inc., Toledo, Ohio. (assignee)
O. E. Rolfe.
U. S. Patent No 3,833,464. Issued Sept 3, 1974. 8 p, 3 fig.

Descriptors: *Pulp wastes, *Chemical precipitation, *Color, Waste treatment, *Waste water treatment, *Lime, Calcium carbonate, Carbon dioxide, Pressure, Effluents, Adsorption.

A method for reducing the color of aqueous pulp and paper mill effluents, such as kraft mill wastes, involves the following chemical treatment steps: (1) Addition of excess calcium carbonate, (2) pressure application in the presence of carbon dioxide to convert the carbonate to soluble calcium bicarbonate, and (3) discharging the pressurized liquid to atmospheric pressure, thereby precipitating insoluble calcium carbonate which carries adsorbed color bodies with it. (Lynch-IPC)
W75-03596

AIR AND WATER POLLUTION CONTROL IN CRUDE TALL OIL MANUFACTURE IN THE PULP AND PAPER INDUSTRY,
Rust Engineering Co., Birmingham, Ala.
A. B. Adams, Jr.
Journal of the American Oil Chemists' Society, Vol 50, No 12, p 498-500, Dec 1973. 3 fig, 4 ref.

Descriptors: Waste treatment, Water pollution treatment, *Pulp wastes, *Air pollution, *Waste water treatment, *Pollution abatement, *Odor, Engineering, Structural engineering, Equipment, Treatment facilities, Incineration, Biochemical oxygen demand, Color, Storage tanks, Valves, Skimming, Byproducts, Sumps.
Identifiers: *Tall oil, Sulfate soap, Kraft mills, Black liquors, Flue gases(Stack gases), Lime kilns, Recovery furnaces, Hoods.

In the production of tall oil from the sulfate soap skimmed from black liquor, the control of air pollution requires preventive measures in the design of new mills, or corrective measures to be taken by older existing kraft pulp mills. For controlling air pollution, these measures involve essentially the enclosure of all black liquor vessels from which tall oil is to be recovered, e.g., by installation of hoods on storage tanks, sumps, heat exchangers, etc., along with ventilation ducts and flue gas scrubbers or incinerators. Odorous gases are typically burned in kraft recovery furnaces and/or lime kilns. Water pollution is prevented best by careful design of soap skimmers, level controls, and valve systems. Some tall oil will still enter the waste water stream and requires an effluent treatment installation designed to remove this additional BOD load, along with the color of the treated effluent. (Witt-IPC)
W75-03598

REMOVAL OF RESIN ACIDS FROM CULTURE MEDIA AND KRAFT-MILL EFFLUENTS BY YEASTS AND SOME OTHER FUNGI,
National Research Council of Canada, Saskatoon (Saskatchewan). Prairie Regional Lab.
F. T. Spencer, G. D. Sinclair, and N. R. Gardner.
Canadian Journal of Microbiology, Vol 20, No 9, p 1288-1290, Sept 1974. 1 fig, 2 tab, 5 ref.

Descriptors: *Microorganisms, *Yeasts, *Fungi, Aquatic microorganisms, *Waste water treatment, Organic acids, *Resins, *Pulp wastes, *Biological treatment, Waste treatment, Toxicity, Nutrients.

Epicoccum nigrum, Rhinocladiella mansonii, Rhodotorula minuta, and Trichosporon cutaneum were evaluated for their ability to remove resin acids from nutrient-supplemented kraft mill effluents and from a nutrient medium containing yeast extract as the sole source of nitrogen. Up to 39% of the resin acid content was removed by all four organisms. As measured by the induction of gene conversion in a strain of Saccharomyces cerevisiae, the mutagenic activity of the resin acid preparation was low, if at all existent. (Witt-IPC)
W75-03599

ULTRAFILTRATION OFFERS 'GOOD' REMOVAL OF COLOR, COD, BOD.
Canadian Pulp and Paper Industry, Vol 27, No 9, p 50-52, Sept 1974. 4 fig, 1 tab.

Descriptors: Treatment facilities, *Pulp wastes, Waste treatment, *Waste water treatment, *Filtration, Reverse osmosis, Membrane processes, Effluents, Separation techniques, *Biochemical oxygen demand, *Color, *Chemical oxygen demand, Pressure, Temperature, Mixing, Costs, Operating cost, Capital cost.
Identifiers: *Ultrafiltration, Agitation, Cellulose acetate, Molecular weight, Kraft mills.

A filtered sample of bleached kraft mill effluent was treated with defoamer and subjected to ultrafiltration at a specific pressure and with constant agitation. The ultrafiltration provided good removals of color, COD, and 5-day BOD. The process was not dependent on pressure, thus operating at lower pressures than reverse osmosis. However, rate of agitation was an important variable. BOD removal was best for a cellulose acetate membrane of 10,000 molecular weight or less. Process economics for a 500 t/day ultrafiltration installation are estimated at $20 to $50 million for capital investment and $1 per 1000 gal in operating costs. (Sykes-IPC)
W75-03600

NOVEL METHODS OF FRESHWATER PREPARATION AND WASTE WATER PURIFICATION IN PULP AND PAPER MILLS (NEUERE METHODEN ZUR FRISCHWASSERAUFBEREITUNG UND ABWASSERREINIGUNG IN ZELLSTOFF- UND PAPIERFAKRIKEN),
C. Auer-Welsbach.
Wochenblatt fuer Papierfabrikation, Vol 102, No 8, p 293-294, 296, April 30, 1974.

Descriptors: *Water purification, Freshwater, Water treatment, *Waste water treatment, Waste treatment, *Pulp and paper industry, *Reverse osmosis, *Flotation, Membrane processes, *Flocculation, *Oxidation, Adsorption, *Activated carbon, Electrochemistry, Chemicals, Industrial water, Industrial wastes, Pollution abatement.
Identifiers: Thermal oxidation, Electrochemical flocculation.

Water and waste water treatment processes based on electroflotation, electrochemical flocculation, thermal oxidation, activated carbon adsorption, and reverse osmosis are reviewed. Process parameters and efficiencies are indicated, and advantages versus limitations of each method are compared. (Speckhard-IPC)
W75-03602

HYBRID DONNACONA TMR PLANT FEATURES ZERO POLLUTION,
L. Skory.
Canadian Pulp and Paper Industry, Vol 27, No 8, p 20-22, Aug. 1974. 5 illus.

Descriptors: *Industrial water, *Recirculated water, *Filtration, *Pulp wastes, *Filters, *Water conservation, Pulp and paper industry, *Canada, Effluents, Discharge(Water), *Waste water treatment.
Identifiers: *Thermomechanical pulp refining, Newsprint, White water(Paper machine effluent).

At Donnacona, Quebec, Domtar Pulp and Paper Ltd. has built a $4.6 million thermomechanical pulp refining (TMR) pilot plant utilizing six disk refiners for defibration of steam-pretreated wood chips to be made into newsprint. The refiner installation is connected with the paper machine's white water system in such a way that water is being recycled and only 100 gal/million with a 20 ppm solids content needs to be sewered. A Vargo filter (made by Polcon Engineering Co.) makes it possible to reclaim all the water needed for dilution of the paper stock in the pulper and for paper-machine shower sprays. (Sykes-IPC)

BIOCHEMICAL PURIFICATION OF WASTE WATERS AT THE SYAVSK (WOOD-PYROLYSIS) COMBINE (BIOKHIMICHESKAYA OCHISTKA STOCHNYKH VOD NA SYAVSKOM KOMBINATE),
Syavskii Lesokhimicheskii Kombinat (USSR).
N. K. Molodtsov, M. F. Morozov, P. S. Fokin, E. V. Mikhalitsyna, and L. N. Smirnova.
Gidroliznaya i Lesokhimicheskaya Promyshlennost', No 5, p 22-24, 1974. 1 fig, 1 tab.

Descriptors: *Industrial wastes, Waste treatment, *Waste water treatment, Treatment facilities, *Wood wastes, *Chemical wastes, *Activated sludge, *Biological treatment, Biochemical oxygen demand, Chemical oxygen demand, Water pollution sources, Foreign countries, Sewage treatment.
Identifiers: USSR, Wood pyrolysis, Joint (Municipal/industrial waste) treatment, Acetic acid, Ethyl acetate, Methyl alcohol(Methanol), Wood tar.

At the wood-processing and silvichemical factory of Syavsk (USSR), mechanical and chemical effluent purification facilities have been operating since 1969. An activated sludge system for biochemical treatment has been added in 1973. Highly polluted effluents originating mainly from wood pyrolysis, manufacture of acetic acid and ethyl acetate, and processing of wood tar and wood alcohol (methanol) are purified jointly with municipal sewage. The treatment installation, which is described in some detail, reduces the effluent COD from 720-1400 to 128-192 mg/liter, i.e., by 82%, and the 5-day BOD from 540-1080 to 6-36 mg/liter, i.e., by 97%. DECOLORIZING DYE WASTES,
Rohm and Haas Co., Philadelphia, Pa. Pollution Control Research Dept.
D. C. Kennedy, B. Stevens, and J. W. Kerner.
American Dyestuff Reporter, Vol 63, No 8, p 11-14, August, 1974. 7 fig, 3 tab.

Descriptors: *Dyes, *Waste water treatment, *Waste treatment, *Chemical wastes, Industrial wastes, Effluents, Anion exchange, Adsorption, Solids contact processes, Pollution abatement, Polymers, Water pollution control, Color, Chemical oxygen demand, Copper, Chromium, Heavy metals, Ion exchange, Solvents, Incineration, Chelation.
Identifiers: *Amberlite resins.

A system employing polymeric adsorption to decolorize streams containing waste dyestuffs has been in operation for about a year at the plant of a major dye producer in the Northeast United States. The system reduces the color of the waste stream (300,000 gal/day) from an average of 75,000 to 500 APHA units on the Pt-Co scale, and the COD from an average of 5,280 to 2,600 ppm. The system also removes copper and chromium both as salts and as organic chelates. The operating system consists of two columns of polymeric adsorbent (Amberlite XAD-7) each followed by an

anion exchange polisher. When exhausted the adsorbent and anion exchange resin are regenerated with a solvent. The solvent is condensed for reuse, and the concentrated aqueous solution of waste dyestuffs is further concentrated and disposed of by incineration. (Witt-IPC)
W75-03608

PROBLEM-FREE CLARIFIER SLUDGE TREATMENT BY A NEW THERMAL TWO-STAGE PROCESS (PROBLEMLOSE KLAERSCHLAMMBEHANDLUNG DURCH EIN NEUES THERMISCHES ZWEISTUFEN-VERFAHREN),
W. Vogeno.
Das Papier, Vol 28, No 5, p 209-210, May 1974. 2 fig.

Descriptors: *Sludge treatment, *Sludge disposal, Ultimate disposal, *Dewatering, *Incineration, Equipment, Treatment facilities, Europe, *Waste water treatment, Pulp wastes, Pumping, Drying, Solid wastes.
Identifiers: *Thermal treatment, Heat recovery, Flue gases, Germany.

Thermal dewatering followed by incineration is the basis of a newly developed two-stage process for drying and disposal of effluent-treatment sludges, which is said to be applicable to sludges of any consistency. The schematically illustrated equipment is produced by KHD Industrieanlagen AG Humboldt Wedag in Cologne, West Germany. It comes in two varieties, one designed for pumpable sludges, the other for thicker slurries, and includes provisions for heat recovery and exhaust gas purification. (Speckhard-IPC)
W75-03609

REMOVING THREE AIR POLLUTANTS AT ONCE.
Environmental Science and Technology, Vol 8, No 9, p 788-789, September, 1974. 1 fig, 1 tab.

Descriptors: *Aluminum, *Air pollution, *Industrial wastes, *Waste treatment, Particle size, Effluents, Recycling, Wastewater.

The removal of aluminum hydroxide, aluminum chloride, hydrogen chloride and particulate matter from the exhaust of an aluminum processing plant by the use of venturi scrubbers was discussed. These scrubbers are unique in that the venturi diverging section is located within the main scrubber chamber and passes vertically through the packed entrainment separator. In operation, gas effluent from the aluminum bonding oven enters the top of the scrubber at the rate of approximately 35,000 acfm while water is injected at 200 gpm. Both water and gas speed through the highly constricted venturi throat and are thoroughly mixed as the water passes over a small turbulence-producing 'knee' projection around the periphery of the venturi throat. Cleansed air is pulled through two 32-in. diameter exhaust pipes (at 16,000 acfm each) at the top of the scrubber, then to the base of a 40-ft. high exhaust stack. Exhausted air is approximately 99% free of pollutants and produces a barely visible steam plume that dissipates itself within about 20 ft. of the stack. The same water used in the manufacturing process is also used in the pollution control system. (Jernigan-Vanderbilt)

DAIRY MANURE MANAGEMENT METHODS,
Washington State Univ., Pullman. Environmental Engineering Section.
D. E. Proctor.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-233 441, $4.75 in paper copy, $2.25 in microfiche. Report No EPA/530/SW-67d, 1974. 128 p, 34 fig, 1 tab, 5 append. G06-EC-00102.

Descriptors: *Farm wastes, *Management, *Dairy industry, *Waste disposal, On-site investigations, Research facilities, Agriculture, Anaerobic conditions, Lagoons, Data collections, Storage, Seasonal, Environmental effects, Land use, Crop response, Sprinkler irrigation, Slurries, Hydraulic transportation, Cattle, *Waste treatment.

New pens for the confinement and feeding of dairy cattle were constructed under a continuous roofed area to prevent the addition of precipitation to the cattle excrement. The manure was collected in underground sumps, pumped to large anaerobic lagoons for wet-season storage, and subsequently applied to crop land during the comparatively drier summer months. Observations were made to evaluate, at least partially, the effect of the roofed environment upon the cattle. Some unseccessful attempts were made to collect the excrement by hydraulic flushing techniques alone. The pump and pipeline transport of manure slurry either to storage or to large bore field irrigation nozzles was quite successful. Observations of surface ponding and runoff, soil penetration, and crop response indicated that the concept of seasonal storage and seasonally scheduled crop land disposal of dairy manure slurry can be an environmentally acceptable and agriculturally compatible method of dairy manure management. Attempts to aerobically treat manure slurry supernatant liquor were technically successful but still impractical. Weather data and soil and water quality data were tabulated in appendixes. Also included were reports on the post-experimental operations, planning and implementation of required facilities and equipment, and construction progress and problems. (Humphreys-ISWS)
W75-03636

APPARATUS FOR BIOLOGICALLY PURIFYING EFFLUENT,
A. F. J. C. Stengelin, V. Stengelin, and J. Stengelin.
US Patent No 3,847,811, 3 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 928, No 2, p 743, November 12, 1974.

Descriptors: *Patents, *Biological treatment, *Aerobic treatment, *Waste water treatment, Water pollution control, Pollution abatement, Water quality control, Equipment, Microorganisms, *Trickling filters, Effluent, Aerobic treatment.
Identifiers: Aerobic microorganisms.

The apparatus for biological treatment of effluent by the use of aerobic microorganisms has at lease one trickling filter. The filter is mounted on a shaft. The individual sections of the filter are immersed successively in the effluent during rotation of the shaft. The filter comprises several annular, segment-shaped or cube-shaped filter sections arranged side by side around the shaft. Passages present a large area into which the effluent penetrates on immersion and from which the effluent drains away again when reemerging. (Sinha-OEIS)
W75-03734

METHOD AND APPARATUS FOR PROCESSING WASTE WATER SLIMES OF STEEL MILL WATER TREATMENT SYSTEMS,
L. A. Duval.
US Patent No 3,844,943, 3 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 2094, October 29, 1974.

Descriptors: *Patents, *Waste water treatment, *Filters, Pollution abatement, Water pollution control, Water quality control, *Slime, *Oil wastes, Iron oxides, *Separation techniques, *Industrial wastes, Filtration.
Identifiers: Magnetic separators, Steel mills.

A method and apparatus are presented for processing a stream of water from a steel mill water treatment system where the water contains iron oxides, liquid oils, heavy oil particles, a slime of finely divided particles of waste materials, and water. The stream is first passed through an operation where a rough separation is made between the lighter components such as slime and oil and the heavier components such as the iron oxides, the heavy oil particles and much of the fine waste particles. The heavier particles are then passed through a classifier where again the heavier components are separated and the lighter oil, slime and water are discarded, after which the heavier material is again passed through a combined scrubber and classifier where extra water and oil solvent are added and the heavier material discharged from this operation, mostly iron oxide, is discharged to oxide storage. Again, the lighter oil slime and water are discharged. All of the oil, slime and water from these previous operations are passed to a thickener where the remaining solids in the stream are settled to the bottom by continuous non-turbulent agitation and liquid oil and water are removed at the top and separated from each other. The solids discharged from the thickener are forced by means of a pump serially through a magnetic separator and a cake filter, the oxides removed in the magnetic separator are discharged to the oxide storage and the cake from the filter is discharged to a filter cake storage. The filtrate from this filter is again discharged back to the thickener. (Sinha-OEIS)
W75-03740

AEROBIC WASTEWATER TREATMENT SYSTEM WITH PARTIAL REUSE AND INFREQUENT DOSING TO SOIL,
Environment/One Corp., Lathan, N.Y. (assignee).
R. P. Farrell, Jr.
U. S. Patent No. 3,844,946, 8 p, 2 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 2095, October 29, 1974.

Descriptors: *Patents, *Waste disposal, *Waste water treatment, *Aerobic treatment, Chemical treatment, Effluents, Equipment, Recycling, Conservation, *Water reuse, *Soil disposal fields, Settling business.
Identifiers: Dwellings, Settling tanks, Drain fields.

A waste disposal system, particularly for dwellings having limited drain fields or drain fields soils having limited capacity, is described. The effluent is removed from an aerobic treatment and settling tank for ultimate return (at least in part) as flushing fluid for toilets, etc. The sludge is removed from the treatment and settling tank for further treatment and settling so that liquid may be removed from the sludge for return ultimately to the treatment and settling tank. The effluent used for flushing purposes is run into a storage tank and thereafter may be chemically treated by a treatment solution educator and stored in the surge tank supplying the toilets until it is used by the toilets in flushing. Waste water from toilets and other sources is deposited in a small holding tank until a predetermined level has been reached, at which time a grinder-pump will remove the waste from the holding tank and discharge it into the aerobic treatment and settling tank. The liquid removed from the sludge is returned to this holding tank. Various pressure and level sensing controls are used in conjunction with a coordinating and timing control unit to control the sequence of operations for efficiency. Excess effluent is discharged to a drain field or the like, in infrequent slug doses in a known manner to thereby enhance performance of any drain field of a given capacity. (Sinha-OEIS)
W75-03741

POWERED MOBILE SPRAY IRRIGATION FOR PRODUCTIVE CROP SEWAGE UTILIZATION,
D. P. Livingston.
U. S. Patent No. 3,844,481, 9 p, 9 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 1953, October 29, 1974.

Descriptors: *Patents, *Irrigation systems, *Sewage disposal, Liquid wastes, *Sprinkler irrigation, Equipment, Conservation, Puddling, *Water reuse, *Waste water disposal, Water conservation.

A mobile, self-propelled rotary irrigation rig uses liquid sewage to irrigate crop lands. The system is designed to avoid puddling. The rig includes a pivot tower, a conduit pivoting about the tower, a series of supports spaced along the length of the conduit, and a series of nozzles spaced along the conduit. The conduit moves so that the nozzles move in arcs to gradually and progressively irrigate adjacent circular sectors. (Sinha-OEIS)
W75-03743

TREATMENT OF SEWAGE,
Sanitas Co. Ltd., London (England). (assignee)
J. H. Stokes, and A. G. Cousins.
U. S. Patent No. 3,846,301, 4 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 264, November 5, 1974.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Pollution abatement, *Disinfection, Chlorination, Bleaching wastes, Effluents, Water pollution control, Water quality control, *Separation techniques, *Chemical treatment.
Identifiers: Deodorizing, Sterilization, Calcium hypochlorite, Caustic alkali, Decoloration.

Sewage is treated by the following steps: (a) Form a mixture of flushing liquid and sewage (b) Separate the mixture into a part which has a high content of solid matter and a part which has a high content of liquid (c) Separate solid matter from liquid in the part with the high liquid content (d) Maintain a chemical composition in that liquid such that the liquid is disinfectant and deodorant (e) Maintain a bleaching action in the liquid so as to have a decolorizing effect (f) Use the liquid as flushing liquid for a repetition of the mixing step (g) Subject the part with high solid content to mechanical reduction of size of pieces of the solid matter (h) Thereafter hold that part in a place of storage, so that substantially all the solid matter is exposed to the chemical content of the liquid constituent of that part and is thereby broken down, dispersed, sterilized and deodorized. (Sinha-OEIS)
W75-03746

ROTATING FILTER FOR WASTEWATER BIOLOGICAL PURIFICATION,
C. Di Bello.
U. S. Patent No. 3,837,492, 3 p, 10 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 926, No 4, p 1266, September 24, 1974.

Descriptors: *Patents, *Filters, *Filtration, *Waste water treatment, Water purification, Water pollution control, Water quality control, *Aeration, Pollution abatement, *Biological treatment, Equipment.
Identifiers: Rotating filters.

The rotating filter comprises at least one assembly of parallel open-ended elongated channels, and a shaft having an axis of rotation about which at least one assembly can rotate. The axis of rotation is to be perpendicular to the elongated channels. The assembly of channels is rotated so that it is periodically in contact with the wastewater and then with the atmospheric oxygen. A biological film develops on the surfaces of the filter. When the filter rotates submerged in the wastewater, the biological film absorbs the organic pollutants present in the same wastewater. When the filter rotates out of the wastewater, the organic pollutants, absorbed by the biological film, are exposed to the oxygen in the air. The natural oxidation transforms the organic pollutants into metabolic products. As the biological film grows, the excess of the film continuously sloughs off the surfaces of the filter, falling by gravity in the bottom of the tank. (Sinha-OEIS)
W75-03747

RECLAMATION OF HYDROCARBON CONTAMINATED GROUND WATERS,
Sun Research and Development Co., Philadelphia, Pa. (assignee)
R. L. Raymond.
U. S. Patent No. 3,846,290, 3 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 260, November 5, 1974.

Descriptors: *Patents, *Groundwater, *Oil wells, Pollutants, *Biodegradation, *Oil pollution, Water wells, *Injection wells, Pollution abatement, Microorganisms, Nutrients, Oxygen, Reclamation, *Waste water treatment, Water reuse.

Hydrocarbon contaminants of underground water sources can be quickly disposed by providing nutrients and oxygen for hydrocarbon-consuming microorganisms normally present in underground waters. Nutrients and oxygen are introduced through wells within or adjacent to the contaminated area and water is removed from the contaminated area until the contaminating hydrocarbons are no longer present or are reduced to an acceptable level. A contaminated producing well will yield hydrocarbon contaminated water due to the presence of hydrocarbons in the water. A second well may be specifically drilled within the contaminated area and adjacent the producing well to be employed as an injection well. At ground level, the injection well will be equipped with a mixing tank for the nutrients and an injection tube extending from the tank to the water level for introducting the nutrients to the subsurface water. An air pump pumps air through a conduit to below the water level. A pump at the producing well removes water from the well through a submerged conduit. The normal microorganism flora between the injection well and the producing well will thus have sufficient nutrients and oxygen to effectively feed on the hydrocarbon substrate present in the area between the wells and decomposition of the unwanted hydrocarbon will proceed. (Sinha-OEIS)
W75-03750

WASTE TREATMENT PROCESS,
Ecolotrol, Inc., Bethpage, N.Y. (assignee)
J. S. Jeris, C. Beer, and J. A. Mueller.
U. S. Patent No. 3,846,289, 4 p, 1 fig, 1 tab, 3 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 260, November 5, 1974.

Descriptors: *Patents, *Denitrification, *Waste water treatment, Pollution abatement, Water pollution control, Water quality control, *Biological treatment, Bacteria, Nitrates, Nitrites, Specific gravity, Temperature, Carbon, Pseudomonas, Hydrogen ion concentration.

A process for denitrifying waste water includes generating a fluidized bed containing denitrifying biota on a particulate carrier, metering a carbon source into the waste water and mechanically removing excess bacterial growth from the carrier at predetermined intervals. The fluidized bed through which the influent waste water is passed is contained in an upright cylindrical column. Waste water enters the column through a distribution manifold in its base. A cylindrical manifold plate having a series of spaced apart holes may be employed to regulate and even the flow of waste water through the column. To perform the process of fluidized bed formed from denitrifying biota attached to a solid particulate carrier or substrate is generated. For optimum denitrification each bed particulate preferably has a thin layer of bacteria seeded thereon. Generally, the bed particles are first cultured to seed bacteria, such as pseudomonas. The specific gravity of such seeded particles must be no less than about 1.1 and preferably greater than about 1.20 in order to insure that such particles are not carried out of the system during operation. In general, the pH of the system is adjusted, if need be, to fall in the range of from about 5.5 to 9.5. Enhanced results are obtained and, accordingly, it is preferred to operate at a pH from about 6.5 to 8.5. The temperature of the fluidized bed environment should be sufficient to permit bacterial activity. Usually, it is kept at from about 5 to 45C. There must be sufficient levels of carbon in the feed influent in order to provide stoichiometric amounts of carbon to permit oxidized nitrogen to be reduced to nitrogen. (Sinha-OEIS)
W75-03751

PROCESS OF AND INSTALLATION FOR PURIFYING SEWAGE,
C. Brucker.
U. S. Patent No. 3,846,291, 5 p, 7 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 261, November 5, 1974.

Descriptors: *Patents, *Aeration, *Biological treatment, *Waste water treatment, Water purification, Water pollution control, Water quality control, Pollution abatement, Microorganisms, Sewage treatment, Equipment, *Sludge treatment, *Recycling, Water reuse.

Sewage is introduced into a basin through an intake located at its upstream end. It is allowed to flow toward the downstream end. A travelling bridge is mounted for reciprocating movement along the basin between both ends. Sludge aerating and recycling devices are mounted on the bridge forming a sludge circuit including a suction intake located adjacent to the bottom of the basin. A suction pump is used for drawing the sludge from the bottom of the basin through the suction intake. The sludge is sprayed into the air toward the upstream end of the basin. The sludge is thus continually recycled in an upstream direction counter to the downstream flow of the progressively treated sewage. (Sinha-OEIS)
W75-03752

EJECTOR AERATED OXIDATION DITCH FOR WASTE TREATMENT,
Kimberly-Clark Corp., Neenah, Wis. (assignee)
A. R. Lecompte, Jr.
U.S. Patent No. 3,846,292, 5 p, 4 fig, 3 tab, 9 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 261, November 5, 1974.

Descriptors: *Patents, *Waste water treatment, *Oxidation lagoons, Water quality control, Water pollution control, Pollution abatement, Sludge, Settling basins, Suspended solids, Liquid wastes, Biochemical oxygen demand.
Identifiers: *Oxidation ditch.

A system for treating waste liquid containing settleable solids and BOD comprises: an oxidation ditch for confining and retaining the waste liquid and defining a continuous, substantially closed flow path through which the confined liquid is moved and providing for a liquid depth of at least about 10 feet; and ejectors for aerating the waste liquid in the ditch to reduce the BOD and for simultaneously moving the waste liquid through the flow path. The ejectors are constructed and arranged so that they are solely capable of circulating the waste liquid throughout the ditch at a velocity of at least 0.3 foot per second to maintain the settleable solids in suspension. The ejectors comprise a housing having a waste liquid inlet for receiving a stream of pressurized waste liquid, a high velocity waste liquid nozzle connected with the waste liquid inlet, an air inlet for receiving air, a mixing chamber connected with the waste liquid nozzle and the air inlet, and a discharge outlet for discharging a high velocity waste liquid-air jet. The ejectors are arranged to discharge the waste liquid-air jets at least about 9 feet below the surface of the waste liquid in the oxidation ditch and in the direction of movement. (Sinha-OEIS)
W75-03753

LIQUID WASTE TREATMENT,
S. J. Campbell.
U.S. Patent No. 3,846,293, 8 p, 3 fig, 4 tab, 11 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 261, November 5, 1974.

Descriptors: *Patents, Liquid wastes, *Waste water treatment, *Coagulation, *Flocculation, Pollution abatement, Water pollution control, Water quality control, Lime, Polyelectrolytes, *Chemical treatment.
Identifiers: Ferric chloride.

Liquid waste is subjected to a multi-phase chemical-physical treatment process. In the first or densifying phase, the waste is treated with a first charge-density reducing agent, preferably an inorganic salt having a trivalent cation and most preferably ferric chloride, to reduce the zeta potential of the particles to a value at which some of the more easily removed, suspended particles coagulate and partially flocculate. These coagulated and partially flocculated particles are maintained in suspension in the liquid and are transferred together with the liquid to a succeeding treatment phase, wherein a sufficient quantity of a second charge-density reducing agent, preferably an inorganic salt having a divalent cation, and most preferably lime, is added to impart to the system a charged-density such that substantially all of the suspended particles flocculate or agglomerate into masses or particles which can be removed readily from the liquid. These flocculated impurities can be removed from the liquid waste in this phase of the treatment process. It is preferable to add a polyelectrolyte, along with the divalent inorganic salt, to the liquid waste containing the floc produced in the densifying phase. (Sinha-OEIS)
W75-03754

WASTE WATER PURIFICATION SYSTEM,
W. C. Hay.
U.S. Patent No. 3,846,296, 3 p, 5 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 262, November 5, 1974.

Descriptors: *Patents, *Waste water treatment, *Filtration, *Flocculation, Pollutants, Water pollution sources, *Biological treatment, Water pollution control, Water quality control, Equipment, Industrial wastes, Domestic wastes, Suspended solids, Irradiation.
Identifiers: Activated charcoal, Gamma radiation, Dissolved organic matter.

Waste water from industrial and/or domestic sources is passed through a filtering stage then through conventional treatment as at a biological treatment station in which the waste water is exposed to organic flocculent materials to break down organic solids suspended in the waste water and then this treated waste water is filtered through a bed of sand. This treatment removes the major portion of the suspended solid materials from the waste water. Then, the waste water is passed through a bed of activated charcoal contained within an irradiation tank upon which organic contaminates dissolved within the waste water are deposited. The absorbent activated charcoal is regenerated by means of gamma radiation issuing from an energy basket contained within the radiation tank which holds the activated charcoal. The tank is surrounded by a heavy shield of concrete material and the entire shielded structure is submerged within a tank of water to prevent radiation escape. (Sinha-OEIS)

WATER POLLUTION RESEARCH IN CANADA 1973,
Toronto Univ. (Ontario). Inst. of Environmental Sciences and Engineering.
Excerpts from Proceedings of 8th Canadian Symposium on Water Pollution Research, February 1973, held at Waterloo Univ., Ontario, Vol 8, 238 p.

Descriptors: *Water pollution, *Canada, *Waste treatment, *Sewage treatment, Organic matter, Effluents, Systems analysis, Sludge disposal, Sludge, Activated carbon, Sludge treatment, Outfall sewers, Urban runoff, Jets, Diffusion, Flow characteristics, Leaching, Sludge digestion, Organic acids, Activated sludge, Waste water treatment, Toxicity, Heavy metals, Phytoplankton, Anaerobic digestion, Iron compounds, Phosphates, Phenols, Landfills, Oxidation.
Identifiers: Alum sludge, Synergistic interactions, Iron phosphate.

Thirteen papers chosen from those presented at the Eighth Canadian Symposium on Water Pollution Research, held at the University of Waterloo in February 1973 appear in this volume. Five deal with metals--toxicity of heavy metals to phytoplankton, anaerobic digestion of primary sludge containing iron phosphate, use of activated carbon to remove trace metals from wastewater, effects of aluminum sludge from water purification plants on municipal primary sewage, and heavy metal tolerance in algae from polluted lakes. Other papers deal with size distribution of dissolved organics in effluents, study of pollution loadings from urban runoff, and performance of aerobic sludge digestion. Also included are papers on phenol removal in wastewater by wet air oxidation, boundary effects on dilution of buoyant jets, phosphorus leaching from sewage sludge used as landfill, and wet air oxidation of low molecular weight organic acid. W75-03770

DETERMINATION OF THE SIZE DISTRIBUTION OF DISSOVED ORGANICS IN EFFLUENTS,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
L. A. Addie, K. L. Murphy, and J. L. Robertson.
In: Water Pollution Research in Canada 1973, Vol 8, p 1-15, 7 fig, 2 tab, 13 ref.

Descriptors: *Waste water treatment, *Organic matter, *Analysis, Tertiary treatment, Effluents, Separation techniques, Filters, Biological treatment, Chromatography.
Identifiers: Fractionation, Gel filtration chromatography, Molecular size, Molecular weight.

Problems concerning molecular size information on organic matter found in wastes and treated effluents are examined and the extent to which this information may be useful in analysis of organic waste constituents is illustrated. Size distributions of the residual organics in secondary effluents were determined using gel filtration with differential ultraviolet and refractive index detection and automated organic carbon and chemical oxygen demand analyses. Samples from activated sludge treatment were filtered, acidified, and purged with purified nitrogen to remove bicarbonate alkalinity. The concentrate was adjusted to pH 5.2-5.5 filtered prior to being applied to the chromatograph for size distribution. Separation into components is possible on the basis of Stokes' radius but not by molecular weight for the unknown organics in wastes and effluents. Identification is possible qualitatively but not quantitatively by UV. Use of COD and refractive index to detect organic components is not a valid procedure for analyzing wastewater and effluents. Inorganics influence the separation either by changing the apparent Stokes' radius (conformation) or through the Donnan salt exclusion effect. Effluents from three plants had similar proportions of carbon in three distinct molecular size ranges. Each size range included acidic, basic, and neutral fractions. W75-03771

A PERFORMANCE STUDY OF AEROBIC SLUDGE DIGESTION,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
K. S. Hogg, and J. Ganczarczyk.
In: Water Pollution Research in Canada 1973, Vol 8, p 26-35, 3 tab, 10 ref.

Descriptors: *Aerobic treatment, *Sludge digestion, *Economic efficiency, Canada, Waste treatment, Operations, Design, Cost comparisons, Evaluation, Capital costs, Treatment facilities.
Identifiers: Dunnville(Ontario).

An evaluation of a full-scale single-stage aerobic digester in the sewage treatment plant in Dunnville, Ontario was conducted during the summer of 1972. Parameters for evaluating aerobic digestion process performance from actual field study were determined and design and operational characteristics investigated with the results compared to other full-scale plants of similar size, and the capital and operational costs associated with aerobic and anaerobic sludge digestion compared. The aerobic digestion system for the sewage treatment plant in Dunnville is operating efficiently. Performance of the Dunnville digester cannot be judged on the basis of the volatile solids removal. The specific oxygen uptake rate in mg oxygen/g VSS/hr which is temperature dependent is one of the most reliable indicators of the biological activity of aerobically digested sludge. Within the context of this study, economical comparison of anaerobic versus aerobic digestion tends to favor aerobic digestion for small activated sludge plants. The cost of power for supplying high volumes of air to the Dunnville aerobic digester was not economically restrictive. Annual power costs associated with aeration of the aerobic digester contents represents 2.5% of the total annual budget for this treatment plant. (See also W75-03770) (Jones-Wisconsin)
W75-03773

DISPOSAL OF ALUM SLUDGE TO THE EXISTING ACTIVATED SLUDGE WASTEWATER TREATMENT PLANT,
McGill Univ., Montreal (Quebec). Dept. of Civil Engineering.
D. Y. Hsu.
In: Water Pollution Research in Canada 1973, Vol 8, p 36-67, 22 fig, 21 ref.

Descriptors: *Sewage disposal, *Activated sludge, *Waste water treatment, Municipal wastes, Sewers, Phosphates, Anaerobic digestion, Dewatering, Sludge.
Identifiers: *Alum sludge.

One of the most promising methods of handling sludge from the alum coagulation process is to discharge it to the sanitary sewers. The qualitative and quantitative effects on the mechanism of each unit of an activated sludge wastewater treatment plant when alum sludge was added, at various concentrations, were determined. It was found that the crucial effects were the increase in sludge production, either in the primary settling tank or in the secondary settling tank, and the retardation of the digestibility of the wastewater sludge. These effects were significant only when the aluminium hydroxide concentrations added were beyond certain limits. The efficiency of wastewater treatment, in terms of removal of organic matter, suspended solids, and phosphate and the sludge dewatering could be improved. Conclusions are that it is feasible to discharge alum sludge into sanitary sewers and treat it in the existing activated sludge wastewater treatment plant. However, it should be discharged into the sewer at a suitable rate to decrease strength of the adverse effects of aluminium hydroxide and the water treatment plant wastes should be discharged into a thickener in the wastewater treatment plant. In: Water Pollution Research in Canada 1973, Vol 8, p 91-109, 10 fig, 4 tab, 25 ref.

Descriptors: *Waste treatment, *Anaerobic digestion, *Sewage sludge, *Iron, *Phosphorus, Nutrient removal, Solubility, Phosphates.
Identifiers: *Primary sludge, *Iron phosphate.

The digestibility of sludges containing metallic phosphate precipitates and about the fate of these precipitates during the anaerobic digestion process particularly as to whether or not phosphorus is returned into solution was investigated. The effect of storage on iron phosphate sludge was first investigated. Storage of the iron phosphate primary sludge at 5C resulted in rapid increases in orthophosphate, total soluble iron and volatile acids concentrations. Since the concentrations of orthophosphate in the fresh iron phosphate primary sludge were several times greater than those of both the raw sewage and the primary effluent, it was concluded that solubilization of phosphorus had begun in the primary clarifier. The stored iron phosphate sludge was usccessfully digested anaerobically after dilution to about 60% of its original strength. Precipitation rather than solubilization of iron phosphate was observed during anaerobic digestion. The digester effluent contained less than 7 mg/l as P or orthophosphate and less than 4 mg/l as Fe of total soluble iron. (See also W75-03770) (Jones-Wisconsin)

REMOVAL OF TRACE METALS FROM WASTEWATER BY ACTIVATED CARBON,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
A. Netzer, and J. D. Norman.
In: Water Pollution Research in Canada 1973, Vol 8, p 110-121, 1 fig, 2 tab, 18 ref.

Descriptors: *Waste water treatment, *Metals, *Activated carbon, *Inorganic compounds, Aluminum, Cadmium, Chromium, Cobalt, Copper, Iron, Lead, Manganese, Mercury, Nickel, Zinc, Hydrogen ion concentration.
Identifiers: Silver.

Experiments were carried out on stock solutions with initial metal concentrations of about 100 ppm and about 10 ppm to assess the possibility that activated carbon treatment would remove aluminum, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, silver, and zinc from wastewater. All metals studied were tested over the pH range 3-11. In this experiment the greatest removal was obtained by a combined process using pH adjustment followed by activated carbon treatment. Less than 0.1 ppm residual metal concentration was obtained for all the metals investigated (except aluminum) over the pH range 4.0 to 10.0. Results are tabulated. The removal of heavy metals by adsorption on activated carbon was proven to be feasible, for greater than 99.5% removal was achieved by pH adjustment and activated carbon treatment for most of the metals tested. This has shown that the higher the activated carbon to metal ratio, the better the removal will be, and over a broader pH range. Because of the relatively high cost of activated carbon, this method will only be economically feasible for residual metal concentrations. (See also W75-03770) (Jones-Wisconsin)
W75-03777

THE EFFECTS OF ALUMINUM SLUDGE FROM WATER PURIFICATION ON MUNICIPAL PRIMARY SEWAGE TREATMENT,
Royal Military Coll. of Canada, Kingston (Ontario). Dept. of Civil Engineering.
J. D. O'Blenis, and T. R. Warriner.
In: Water Pollution Research in Canada 1973, Vol 8, p 122-147, 16 fig, 4 tab, 5 ref.

Descriptors: *Sewage treatment, *Water purification, *Sludge disposal, Filtration, Pilot plants, Nutrient removal, Phosphates.
Identifiers: Alum sludge.

Sludges from two different water purification plants were tested along with alum and a combination of alum and water purification sludge, for their effects on the removal of suspended solids, chemical oxygen demand, and phosphates. Results indicated that the two water treatment plant sludges did not impair sewage treatment at dosages up to about 10% of hydraulic flow. Both sludges exhibited a capability for removal of phosphate from domestic sewage. In the range of 75% to 98% relative phosphate removal, sludge dosages are seven to nine times as large as those required using alum (as aluminum). The sludges decreased in their phosphate removal capacity following successive exposure to sewage. The use of alum and sludge together enhances the phosphate removal performance of each, with combined removals greater than the cumulative effects of each if used separately. Recycling the clarifier underflow sludge reduces the dosing requirements of water treatment alum sludge for a specific phosphate removal objective. Suspended solids performance of primary clarifiers may be enhanced by sludge addition providing solids overload is avoided. Chemical oxygen demand reductions across the pilot primary clarifier, compared with undosed operations, were improved approximately 100% by addition of waterplant sludge. REMOVAL OF PHENOL IN WASTE WATER BY WET AIR OXIDATION,
Ottawa Univ. (Ontario). Dept. of Chemical Engineering.
B. B. Pruden, and D. R. Ferguson.
In: Water Pollution Research in Canada 1973, Vol 8, p 148-167, 11 fig, 20 ref.

Descriptors: *Waste water treatment, *Oxidation, *Phenols, Organic matter, Energy, Mass transfer, Chemical reactions, Mathematical models, Energy conversion.
Identifiers: *Wet air oxidation, Unmixed reactors, Zimmermann process, Steam energy.

Treatment of waste waters containing phenols by conventional methods poses some unique problems: at 80-100 ppm, phenol is a food for bacteria and can be oxidized in an activated sludge plant, whereas at concentrations above 200 ppm it is a bactericide, necessitating waste dilution before treatment. The wet air oxidation process has been applied to the continuous oxidation of phenol in dilute solutions and was shown to be effective in converting up to 99.5% of the phenol to carbon dioxide and water, in a simple unmixed reactor. A mathematical theory has been adapted which allows all of the data to be plotted on one graph for one temperature from which the effect of mass transfer and chemical reaction can be obtained. The effects of imperfect mixing, phenol distillation, and gas humidification on the use of correct terms in the equation are discussed. At high concentrations mass transfer control can be neglected whereas at low concentrations chemical reaction control can be neglected supporting the thesis that 'no mixer may be required' with the qualification that the reactor concentration, determined by the pressure, temperature, and residence time be sufficiently low. This process in a continuous flow system is feasible and workable, with possible application to water pollution control. (See also W75-03770) (Auen-Wisconsin)

PHOSPHORUS LEACHING FROM SEWAGE SLUDGE USED AS A LANDFILL,
Windsor Univ. (Ontario). Dept. of Chemical Engineering.
P. K. Wadehra, and M. Adelman.
In: Water Pollution Research in Canada 1973, Vol 8, p 202-223. 11 fig, 9 tab, 9 ref.

Descriptors: *Nutrient removal, *Phosphorus, *Sewage sludge, *Leaching, Landfills, Waste treatment, Waste disposal, Anaerobic digestion.

The effect of anaerobic digestion on total phosphorus present as soluble and insoluble phosphates in raw sludge, the effect of the addition of chemicals on the total soluble and insoluble phosphates when it is digested anaerobically, and the effect of water on the phosphorus release from the dried sludge, as it might be used as landfill, was investigated. It was concluded that during anaerobic digestion of raw sludge, a large portion of the total soluble phosphates present is converted to an insoluble form. The ratio of orthophosphate to condensed phosphate in the effluent digested sludge was roughly equal to that in the raw sludge, indicating that anaerobic digestion was unfavorable for any significant conversion of one phosphate form to another. The amount of phosphorus released from the sludge cake to water is independent of pH at pH 4.0 and 9.0, and was greatly reduced when the sludge was anaerobically digested. Phosphorus release to water was greatly reduced when the raw sludge was treated with either ferric chloride or alum, with the alum producing a somewhat greater insolubilization effect than the ferric chloride. The addition of ferric chloride or alum to the sludge before anaerobic digestion only slightly improved the phosphate insolubilization. (See also W75-03770) (Auen-Wisconsin)

WET AIR OXIDATION OF LOW MOLECULAR WEIGHT ORGANIC ACIDS,
Waterloo Univ. (Ontario). Dept. of Chemical Engineering.
P. E. L. Williams, D. C. Day, R. R. Hudgins, and P. L. Silveston.
In: Water Pollution Research in Canada 1973, Vol 8, p 224-236. 7 fig, 12 ref.

Descriptors: *Sewage treatment, *Sludge treatment, *Oxidation, *Kinetics, Organic matter, Mass transfer, Organic acids, Equations.
Identifiers: *Wet air oxidation, Zimmermann Process.

A kinetic study of wet air oxidation, using propionic acid, identified the kinetic-control regime, developed a rate equation model, and investigated the oxidation mechanism. Results indicated that wet air oxidation of the lower carboxylic acids appears to be kinetically rather than diffusion controlled under normal operating temperatures from 300 to 600C. Oxidation apparently occurs only in the liquid phase and is predominantly homogeneous. Rate studies suggest that reaction is not first order in acid or oxygen. The activation energy for propionic acid oxidation was found to be about 62 kcal/gmole. Acctaldehyde was found to be an intermediate in the oxidation of both butyric and propionic acid. Attack at the alpha carbon of the carboxylic acid is indicated by the results. Acetic acid is found in large quantities when oxidation is incomplete because it is oxidized much more slowly than higher members of its homologous series. The induction period, the scatter of the data, and the presence of small amounts of low molecular weight hydrocarbons in-

dicate a free radical mechanism is involved in wet air oxidation. (See also W75-03770) (Auen-Wisconsin)

RECYCLING MILLING WATER IN MISSOURI'S NEW LEAD BELT,
Cominco American, Inc., St. Louis, Mo.
F. H. Sharp, and K. L. Clifford.
Mining Engineering, Vol 25, No 7, p 68-72, July 1973. 2 fig, 3 tab.

Descriptors: *Water reuse, *Mine water, *Froth flotation, *Lead, *Mineral industry, Metals, Zinc, Copper, Industries, Mining, Mills, Frothing, Reclaimed water, Industrial wastes, *Recycling, Flotation.

Tests were run at two mines in dry areas of Missouri's New Lead Belt which must rely on water reclaimed from their tailings lake to augment the mine water. In the mills in this study, lead concentrate is the principal product with lesser amounts of zinc concentrate and copper concentrate. One mine has a tailings lake with a theoretical retention time of 6 months. The return water will not produce a persistent froth, however, minute amounts of alcohol or glycol frother produce voluminous froth. Oily oxidation products in reclaimed water can seriously handicap the separation of copper from lead in milling. Control of pH is necessary to keep heavy metals concentrations low and prevent sphalerite activation when the water is returned to the mill. Another mine has had success with recycling mill water over a test period of six months. By comparing mill tails COD with recycle water COD, an indication of degradation or buildup is possible. THE EFFECT OF INCORPORATING HEN MANURE INTO THE DIET OF YOUNG CHICKS,
Florida Univ., Gainesville. Dept. of Poultry Science.
D. R. Sloan, and R. H. Harms.
Poultry Science, Vol 52, No 2, p 803-805, March, 1973. 3 tab, 4 ref.

Descriptors: *Farm wastes, *Poultry, Diets, Feeds, Proteins, Growth rates, Performance, *Waste treatment, Waste disposal.
Identifiers: *Refeeding, Manure recycling, Chicks, Air-dried hen manure, Feed efficiency, Growth depression, Uric acid, Feed consumption.

The effect of adding air-dried hen manure to a chick diet was studied. Two experiments were conducted using 720 day-old broiler-type chicks. In the first experiment, protein levels of 16, 20, and 24% were fed with five levels of hen feces. Manure was substituted on a pound for pound basis in the basal diet. Diets used in the second experiment contained either 20, 24 or 28% protein with three levels of manure, and 2 levels of sand. A decrease in growth was obtained with each increase in manure level. The incorporation of the manure at any level of protein was detrimental to weight gain. A decrease in growth and feed efficiency was obtained by adding either 5 or 10% hen manure to the feed. The addition of 5% sand did not influence growth or feed efficiency. When the level of sand was increased 10% a significant growth depression was obtained when the diet contained only 20% protein. However, growth was not depressed at levels of 24 or 28% protein. It would appear that some factor is present in air-dried hen manure, perhaps uric acid, which masks the bird's ability to eat and meet its energy requirements, thus having a depressing effect upon body weight gain and decreasing feed utilization. REPLACES NEW WORKS 1900 INSTALLATION.
Water and Waste Treatment, Vol 16, No 12, p 13, 15, December, 1973.

Descriptors: *Sewage disposal, *Treatment facilities, Sludge, Pumping plants, Construction, Design, Filters, Filtration, *Sludge treatment, *Waste water treatment.
Identifiers: England.

The complete reconstruction of the sewage disposal works at Faversham (Kent, England) is described. Before the reconstruction, the works were mainly as they had been constructed just after 1900 and tanks. Sludge settled out in the main pumping station and was desludged manually once a week and put into open sludge lagoons with no underdrainage. In 1971 alterations began on the existing pumping station involving work below Ordnance Datum and the increase in pumping capacity at that station to avoid the storm overflows functioning. The existing rising main was found to be adequate for the new flows at an increased velocity. (Merritt-FIRL)

Descriptors: *Sewage, *Sludge, *Treatment facilities, *Dehydration, Forced drying, Steam, Municipal wastes, *Waste water treatment.
Identifiers: Fluidized-bed drier.

The thermal drying of mechanically dehydrated urban sewage sludge in a slot type fluidized-bed drier was studied. Small pieces of mechanically dehydrated sewage sludge were fed into an upright cylindrical space and were kept suspended over a slot by hot gas stream entering the cylinder through that slot. The dried sludge particles entrained by the hot gas stream were separated by a cyclone. Slot type fluidized-bed driers were found highly suitable for the drying of urban sewage sludge at thermal efficiencies of 57-58 percent, at an initial moisture content of 60-65 percent and for particle sizes not larger than 20 mm. The fluidized-bed height should not be less than 250 mm, and the hot gas temperature should be between 450 and 500 C. The specific fuel expenditure was found to range from 1,200 to 1,250 kcal/kg evaporated moisture. The drying capacity, determined for final moisture contents of 20-30 percent and 6-10 percent, amounts to 500-550 kg/cu m. h and to 600-650 kg/cu m. h, respectively. (Takacs-FIRL)

TALKING TANKERS.
Effluent and Water Treatment Journal, Vol 14, No 6, p 323-328, June, 1974. 7 fig.

Descriptors: *Sludge, *Sludge disposal, *Fluid mechanics, Flow, Flow resistance, Gravity, Sanitary engineering, Environmental engineering, Waste disposal, Pumps.
Identifiers: *Wet waste tankers, Positive displacement pump, *Vacuum pumps.

Choosing the correct wet waste tanker for different situations is discussed. The basic requirements must be defined but the supplier should be left with some flexibility so to offer the best equipment for the job, within the specified limits, bearing in mind cost and availability. The simplest tanker is the unit which uses gravity for both filling and discharge. The advantages of this type are the largest possible carrying capacity, the low initial cost, and the virtually free maintenance. The disadvantages are that there must be some external source for filling and the contents cannot be self-pumped into above-ground storage tanks. The other types of tanks use pumps singly or in combination either with other pumps or with gravity. Two types of pumps are relevant - the vacuum pump and the positive displacement pump. The vacuum pump is used in the case of corrosive, abrasive, or high solid content wastes because the liquid does not pass through the pump. The overall design of the tankers is also discussed. Identifiers: *Dredge spoil disposal, Dredge spoil.

This is the final report of a group of successive volumes related to a survey of ocean waste disposal practices in six major coastal areas of the United States: the New York Bight; Charleston, South Carolina; the Gulf Coast between Port St. Joe, Florida, and Port Isabel, Texas; Southern California; San Francisco; and Puget Sound. Specific problems were associated with disposal site selection, criteria development and control and monitoring of disposal operations. The purpose was to assist the Ocean Disposal Program of the Environmental Protection Agency in the development of criteria for the control of ocean waste disposal. (Humphreys-ISWS)

EVALUATION OF THE GEORGIA WATER SUPPLY PROGRAM.
Environmental Protection Agency, Atlanta, Ga.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-227 215, $7.00 in paper copy, $2.25 in microfiche. July 1973. 192 p.

Descriptors: Water supply, *Evaluation, *Water quality standards, *Water users, Water quality, *Geogria, *Treatment facilities, Facilities, Standards, Chlorination, Distribution systems, Programs, Laboratory tests, *Potable water, Public health.
Identifiers: *Water supply surveillance, *Bacteriological surveillance standards, Regulations, Federal drinking water standards.

Program effectiveness was judged primarily on the basis of drinking water quality, adequacy and condition of water system facilities, and water supply surveillance found in a field evaluation of actual supplies. Twenty public and 81 class III (small public) supplies representing a cross-section of water supply practice were studied. Staff limitations and unresponsive administrative procedures have prevented the Water Supply Program from providing health evaluation and engineering services necessary to fulfill its responsibilities to protect residents' health. Some problems were: unmet chemical and bacteriological surveillance standards, deficient treatment facilities, unsafisfactory chlorination practice, inadequate distribution system storage, inadequate cross connection control programs, inadequate operational records, inadequate water quality testing. Recommendations include: (1) immediate upgrading of bacteriological surveillance of public water systems; (2) increased and improved engineering surveillance of all public water supplies to at least minimum levels including periodic sanitary surveys of each system, complete routine chemical analysis of all supplies; (3) elimination of present sanction of seriously deficient water systems plus revitalization of certification program to obtain compliance with adequate standards; (4) use of legally enforceable compliance order procedures if necessary; (5) designation of County Health Departments to be responsible for surveillance of small public water systems; (6) implementation of provision of new flouridation legislation as soon as possible; (7) development and distribution of a single document incorporating program policy and design systems for public water systems. Expanded funding and program redirection and revitalization are essential for the program to attain full effectiveness and to meet its responsibilities. (Diefendorf-North Carolina)

PACKAGED PUMPING STATIONS FOR SUBURBAN WATER DISTRIBUTION,
J. B. Rishel.
Water and Sewage Works, Vol 121, No 4, p 131-132, 134, April 30, 1974. 7 fig.

Descriptors: *Pumping plants, *Water distribution, Water works, Evaluation, Equipment, Pumps, Storage tanks.

Packaged pumping stations are available in several types and their efficient application requires an evaluation of these pumping stations as well as the types of systems that are encountered in water distribution. The three specific styles of stations are the constant speed pumps without discharge pressure control valves, constant speed pumps with discharge pressure control valves, and the variable speed pumps. Suburban water systems are of two general types with storage tanks or without storage tanks closed systems. One of the most important factors for any distribution system to be evaluated is the friction loss in the piping of the water distribution system. The basic types of distribution systems with typical system head curves are described. The packaged pumping station selected is dependent upon the size of the system, the topography of the system, and the quality of electrical power available. Also included is a description of four different water distribution systems. (Sandoski-FIRL)

GUIDELINES FOR LAND DISPOSAL OF FEEDLOT LAGOON WATER.
Kansas State Univ., Manhattan. Cooperative Extension Service.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 591, $3.25 in paper copy, $2.25 in microfiche. 1973. 7 p, 9 fig, 7 tab, 1 ref. OWRT A-046-KAN(2). 14-31-0001-3516.

Descriptors: *Waste water disposal, *Feed lots, *Salinity, Irrigation water, *Kansas, Nutrients, Nitrogen, Phosphorus, Salts, *Water quality standards.

Guidelines are provided for feedlot operators who dispose of lagoon water on agricultural lands. The design of lagoon, pumps, and irrigation systems

are not discussed. Because lagoon water contains such plant nutrients as nitrogen, phosphorus, and potassium, its application on agricultural land, in correct amounts, can increase crop yields. However, because it also contains salts of sodium, calcium, and magnesium, too much lagoon water can pollute the soil. The salt accumulation from lagoon water is most likely to occur in dry areas where precipitation is not adequate to leach the salts downward below the root zone. Guidelines on how to dispose of such lagoon water to minimize the chance of reducing the land's productivity are given. The guidelines are based on present irrigation-water-quality standards and on data collected from various feedlots in Kansas. (Powers-Kansas State)

Descriptors: *Pollution taxes(Charges), *Economic efficiency, *Pollution abatement, *Water policy, Water pollution control, *Taxes, Model studies, *Mathematical models.

A generally held proposition is that the imposition of taxes to combat pollution is at least as efficient as the imposition of standards. Several authors have argued that taxation may not lead to an efficient outcome. This paper demonstrates that taxation may not be efficient under circumstances when the firm has at its disposal a number of production processes of the fixed proportion, constant return to scale variety. The discussion proceeds in three stages: (1) a geometrical example is presented; (2) a mathematical model is demonstrated; and (3) a discussion of the relevance of conclusions is made. The situation posed above is not uncommon. It is typical of situations faced by firms in steel, phosphate production, pulp and paper, and petroleum industries, where a number of alternative processes are technologically feasible and the selection of a particular process or combination of processes in a plant is an economic choice. Another factor reinforcing the appropriateness of the model are existing accounting practices which have treated unit costs as constant over substantial ranges whether or not such costs are constant in actuality. The distributional impacts of five federal water pollution grant programs on 50 states and the District of Columbia during the years 1957-71 are assessed. The grant programs include the EPA's Water Pollution Control Acts; the HUD Acts; the Farmers Home Administration Act; the Public Works and Economic Development Act (EDA); and the Appalachian Regional Development Act. Expenditures under each program during the period were $3,525.96, $368.70, $87.90, $263.74, and $41.57 million respectively. Two procedures to measure the equity impact are utilized. The first utilizes a net transfer approach. Expenditures for each of the federal programs under the approach are treated as gross transfer payments and are netted against tax burdens imposed to support these programs. Results suggest that substantial differences exist in both total and per capita grants and average personal income by state appears weak. Only a weak geographic pattern exists for states favored by the overall program. Applying least-squares regression to per capita tax contribution for all grant program's impact on per capita personal income indicates no significant relationship exists. The second equity approach presented hypothesizes assumptions about potential returns from the grants and then tests the sensitivity of the equity impact to program effectiveness. ENVIRONMENTAL LAW--OIL POLLUTION CONTROL--IN THE ABSENCE OF FEDERAL PREEMPTION AND ANY FATAL CONFLICT BETWEEN STATUTORY SCHEMES, A STATE MAY CONSTITUTIONALLY EXERCISE ITS POLICE POWER TO PROVIDE FOR CLEANUP OF OIL SPILLAGE AND FOR RECOUPEMENT OF COSTS CONCURRENTLY WITH THE FEDERAL GOVERNMENT,
M. E. Deal.
Georgia Journal of International and Comparative Law, Vol 4, p 216-224, 1974. 67 ref.

Descriptors: *Florida, *Judicial decisions, *Oil pollution, *Legislation, *Federal government, Governmental interrelations, State jurisdiction, Federal jurisdiction, Water pollution sources, Oil spills, Oil industry, Oil, Cost allocation, Costs, Economic impact, Government finance, Water pollution, Oceans, Environmental effects, Adoption of practices, Water Pollution Control Act, Water quality control.
Identifiers: Coastal waters, Injunctive relief, State policy.

The relationship between state and federal regulation in the admiralty area has been a source of confusion in the development of maritime law. In Askew v. American Waterways Operators, Inc., plaintiff-appellee, operators of oil terminal facilities, brought an action against the State of Florida to enjoin application of the Florida Oil Spill Prevention and Pollution Control Act. They challenged it on the grounds that the provisions for unlimited liability conflicted with the Federal Water Quality Improvement Act of 1970 and the Limitation of Liability Act. Defendant-appellant maintained that the Federal Act encouraged state regulation and cooperation. The United States Supreme Court held that the Florida Act does not invade a regulatory situation pre-empted by the Federal Act. The end result, hopefully, will be to strengthen the state's power to protect its environment by enacting stringent pollution control laws, and to allow the state power to be concurrent with the federal government. The unlimited liability provision of the Florida Act will probably be upheld because cleanup costs to the state are a separate expense not covered by the Federal Act. (Dillingham-Florida)

U.S. CHECKING UP ON FIRMS' SPILL-PREVENTION, CLEANUP PLANS.
The Oil and Gas Journal, Vol 72, No 30, p 117, July 29, 1974.

Descriptors: *Oil spills, *Water pollution control, *Federal government, Water policy, *Pollution abatement, Water quality control, Regulation, Water quality standards.

Spot checks are being taken of possibly hazardous oil facilities by government agents, in areas of navigable waters or their tributaries which have a pollution prevention program. Such programs, certified by registered professional engineers, were to have been completed by July 10, 1974. These plans are not required to be filed with the EPA. Oil companies are requested to build dikes around storage tanks or use any other steps for containment of oil spills. If spills should occur, the EPA would probably dictate the terms of the prevention plan required under the regulations. (Leibowitz-FIRL)

WILLINGNESS TO PAY FOR POLLUTION ABATEMENT: A CASE STUDY,
Guelph Univ. (Ontario).
D. A. L. Auld.
Alternatives, p 34-36, Winter 1974. 1 tab.

Descriptors: *Pollution abatement, Regression analysis, Social aspects, Economic impact, Social values, *Canada, Lake Ontario, Pollution taxes(Charges), *Attitudes.

Personal interviews were conducted in two Canadian cities, Hamilton and Guelph, to assess information on: (a) willingness-to-pay for pollution abatement in general; (b) payments for specified degrees of abatement; and (c) the relationship between willingness-to-pay and socio-economic factors such as income, age, education, and location. Hamilton, an industrial city of 300,000 located on Lake Ontario, specializing in steel, is subject to considerable air and water pollution. Guelph, a city of 60,000, is in an agricultural setting and experiences little pollution. A total of 306 and 100 householders were interviewed for each city, respectively. Results indicate that 26 and 22 percent of the respondents from Hamilton and Guelph were not willing to pay for pollution abatement, with no significant relationship found between this variable and income, age, education, or location. With respect to willingness-to-pay, an inverse relationship was discovered between age and amount willing to pay. Some relationship between willingness-to-pay and income was also discovered although it was less than proportional. No relationship between willingness-to-pay and proximity to pollution sources was found. (Schroeder-Wisconsin)

THE ECONOMIC EFFECTS OF THE 1971 FLORIDA RED TIDE AND THE DAMAGE IT PRESAGES FOR FUTURE OCCURRENCES,
Mote Marine Lab., Sarasota, Fla.
E. J. Habas, and C. K. Gilbert.
Environmental Letters, Vol 6, No 2, p 139-147, 1974. 2 tab, 7 ref.

Descriptors: *Red tide, *Economic impact, Water pollution sources, *Gymnodinium, *Florida, Economics, Tourism, *Damages, Environmental effects, Costs.
Identifiers: Gymnodinium breve.

In the summer of 1971 the red tide devastated the west coast of Florida, creating environmental and economic chaos. The economic impact is summarized. Data collection to determine the economic impact was made difficult due to three factors: (1) the actual duration of the red tide is difficult to delineate; (2) the economy of the seven affected coastline counties was generally subordinate to the remaining unaffected sectors of the counties; and (3) 1971 was a year of substantial growth for all seven counties. Data was first sought through questionnaires to the Chambers of Commerce in affected areas, but poor responses limited its usefulness. Personal interviews with proprietors of gulf resorts and other business, local newspaper accounts, and extrapolation of Florida's Department of Commerce and Business publications were also used. Results indicate that the Red Tide caused nearly $20 million in damage, including: $6 million, hotels/motel revenues; $2.5 million, restaurants; $2.2 million, amusement; and $3.8 million, other business revenue. A number of economic factors including loss of worker income and fishing revenue were not included in the tabulation. A future Red Tide of equal severity could cause up to 40% more economic damage. (Schroeder-Wisconsin)

THE IMPACT OF WATER RESOURCE QUALITY CHANGES ON SURROUNDING PROPERTY VALUES,
Dornbusch, David M. and Co., Inc., San Francisco, Calif.
S. M. Barrager.
Water Resources Bulletin, Vol 10, No 4, p 759-765, 1974. 2 ref.

Descriptors: *Water pollution control, *Pollution abatement, *Property values, Economic impact, Benefits, *Regression analysis, *Oregon, Water quality.
Identifiers: Neighborhood amenities, Nuisances, *Willamette River(Ore), Clackamas County(Ore).

Multiple regression techniques are utilized to measure the impact of pollution abatement efforts on property values of proximate single-family residences along Oregon's Willamette River. The study areas, Oak Grove and Jennings Creek, located in an unincorporated portion of Clackamas County, are dominated by single-family houses over 15 years old and having an average value of $26,000. Water quality in the river has improved dramatically over the 1960 to 1970 period. To determine the change in property values over the same period in the study area, tax assessment value data were collected as a partial proxy for the years surrounding 1960 and 1970. Sales price data were also collected. Property value changes for the period were calculated by adding the capitalized value of property tax changes to the estimated change in sales or market value. Results of the regression model indicate that changes in property values attributable to water quality improvements were substantial and statistically significant. Applicability of the regression model to the responses of property values to other stationary neighborhood amenities or nuisances, including highways, airport, parks or commercial parks, is also discussed. (Schroeder-Wisconsin)

DETERMINING AN EQUITABLE SURCHARGE FOR INDUSTRIAL WASTES,
Gilbert Associates, Inc., Reading, Pa.
L. E. Ritter, and P. A. Podolick.
Public Works, Vol 104, No 7, p 84-88, 1973. 2 fig, 4 tab.

Descriptors: *Industrial wastes, *Pollution taxes(Charges), Economic efficiency, Planning, Industries, Effluents, Waste water treatment, Water pollution control, *Costs, Sewage treatment, Cities.
Identifiers: *Surcharges(Pollution control).

Development of a surcharge formula to equitably tax firms producing strong wastes is shown for one eastern U.S. city. Previously, the city operated on a permit system which limited industrial waste output to minimum levels set by ordinance. The permit method was unsatisfactory because of the difficulty of enforcement and potential inefficiencies resulting from pre-treatment requirements. The development of a surcharge formula began with a series of surveys of field inspection of city facilities; personal interviews with representatives of each company identified as potential producers of extra-strength waste; and actual field sampling at each company. Based on this, 24 firms were designated to be surcharged. The list included each industry discharging wastes exceeding the BOD, suspended solids and/or dissolved solids concentrations of domestic sewage specified by ordinance. From the sampling results, average concentration of the above were determined by industry. The basic approach to determine the surcharge is to determine the actual cost of treatment on a unit cost basis/waste parameter, and apply unit costs for treatment of industrial waste discharges to the portion of the waste load in excess of normal domestic waste. METROPOLITAN WATER SEWERAGE AND DRAINAGE BOARD, SYDNEY, EIGHTY-FIFTH ANNUAL REPORT, YEAR ENDED 30TH JUNE 1973.
Metropolitan Water Sewage and Drainage Board, Sydney (Australia).
(1973). 55 p, 3 fig, 12 tab, photos, 12 append.

Descriptors: *Sewerage, *Drainage systems, *Australia, *Water distribution, Reservoirs, *Water supply, Water conservation, Pumping plants, Expenditures, Budgeting, Construction, Stormwater, Storage capacity, Tunnel construction.
Identifiers: *Retriculation, *Sydney(Aust), *Stormwater drainage, Stormwater channels, South Coast area, Shoalhaven Scheme, Ocean outfall systems.

The Metropolitan Water Sewerage and Drainage Board, established by law in 1924, is responsible for conservation, preservation, and distribution of water; for the provision of sewerage facilities; and for construction, control and maintenance of certain stormwater channels in an area of some 4,000 square miles, including metropolitan Sydney, a number of outlying cities, and the South Coast areas. Water supply system consists of 6 major and 4 minor storage reservoirs, 191 service reservoirs, 116 pumping stations and 9422 miles of watermains (246 miles of new mains in 1972-3). There are 194 miles of channels in the stormwater drainage network and 7774 miles of sewers in the 19 separate sewer systems. On June 30, 1973, the Board was supplying water to an estimated 3,063,000 people, while sewerage facilities were available to an estimated 2,600,000 people. Total revenue for the year was $136,591,820 and expenditure was $136,582,093. The Board is currently engaged in a ten-year (1971-81) program to insure sufficient water storage and water and sewerage services to meet the foreseeable requirements of its area. Work on Shoalhaven Scheme to bring water from Nepean Reservoir to the South Coast by constructing a diversion tunnel is virtually completed. Other Shoalhaven contracts for earthwork dams, pumping stations and hydraulic gates, relocation of roads and railroads are progressing on schedule. Total cost of project is estimated at $104 million with Board's share approximately $86 million. (Diefendorf-North Carolina)

METROPOLITAN WATER SEWERAGE AND DRAINAGE BOARD, SYDNEY, EIGHTY-SECOND ANNUAL REPORT YEAR ENDED JUNE 1970.
Metropolitan Water, Sewage and Drainage Board, Sydney (Australia).
(1970). 67 p, 3 fig, 14 tab, photos, 14 append.

Descriptors: *Water distribution, *Water storage, *Sewage treatment, *Drainage systems, *Water supply, *Budgeting, Australia, Reservoirs, Pumping plants, Expenditures, Construction, Engineering structures.
Identifiers: *Sydney(Aust), Stormwater channels, South Coast area, Sewerage reticulation.

The Metropolitan Water Sewerage and Drainage Board's activities during 1969-70 and important works currently being undertaken plus a description of various water supply, sewerage and drainage systems under its jurisdiction are discussed. Established in 1924, the Board is equipped with all the resources for investigation, design, construction, and operation of large engineering projects. Water storage, water distribution, sewerage reticulation and sewage treatment are major activities. Water supply system has 6 major and 4 minor storage reservoirs, 183 service reservoirs, 112 pumping stations and 8805 miles of

watermains with 270 miles of watermains being added during 1969-70. Shoalhaven Project, involving construction of a tunnel between Nepean and Avon Dams to divert water from Nepean Reservoir to the South Coast plus building of power plants and pumping stations, is in the design work stage. There are 6804 miles of sewers and 190 miles of channels in the stormwater drainage network. Water was being supplied to an estimated 2,968,000 people, while sewerage facilities were available to an estimated 2,374,000 people. Total revenue for the year was $88,343,448 and expenditure from revenue was $88,328,341. Progressive augmentation of water storage and major supply system to insure that adequate quantities are available to meet increasing consumer demand is top priority planning item. METHOD AND APPARATUS FOR RECOVERING A SUBSTANCE FLOATING AS A SHEET ON THE SURFACE OF A LIQUID MASS,
Societe Bertin et Cie, Paris (France).
J. Mourlon, and E. M. R. Dubois.
Canadian Patent 948,120. Issued May 28, 1974. Patent Office Record, Vol 102, No 22, p 22-48, May, 1974.

Descriptors: *Floating, *Patents, *Liquid wastes, *Separation techniques, Waste water treatment, Oil wastes, Water pollution control.
Identifiers: *Recovery.

A process is described for recovering a substance, such as a hydrocarbon, spread as a thin sheet and floating on the surface of a liquid. The liquid is, in the vicinity of its surface, subjected to a local rotating movement so as to bring about the formation of a vortex-type cavity. The cavity is open and has a vertical axis; it accumulates the substance originating from the sheet; and from this cavity the accumulated substance is extracted. The amount extracted is automatically replaced, as it is being extracted, by further substance emanating from the sheet. (Prague-FIRL)

A SURVEY OF INTERNATIONAL CUSTOMARY RULES OF ENVIRONMENTAL PROTECTION,
Wadham Coll., Oxford (England).
I. Brownlie.
Natural Resources Journal, Vol 13, No 2, p 179-189, April 1973. 32 ref.

Descriptors: *International law, *International waters, *Pollution abatement, *Legal aspects, *Environmental control, Water law, Controls, Standards, Regulation, Jurisdiction, Political aspects, Water rights, Water policy, Water quality control, Water pollution, Water resources, Water resources development, Water management(Applied), Adoption of practices, Administration.
Identifiers: *International agreements.

Customary law provides limited means of social engineering, and, therefore, there is a particular need for development of new institutions, standards and local units to deal with the protection of the environment. Encompassed within the scope of customary or international law are three main concepts: state responsibility, territorial sovereignty of states, and, freedom of the seas. Although these three areas cover much of the critical environmental aspects of international concern, there are some areas where new solutions and practices must be fashioned to cope with the mounting problems. Solutions include forming special zones of jurisdiction as Canada has done in their 1970 Arctic Waters Pollution Prevention Act. Unilateral self-help in emergency circumstances is another practical remedy, as illustrated by Britain's actions in dealing with the Torrey Canyon disaster. Probably the most useful and lasting proposal involves the formation of new standards in general international law, promulgated, instituted and enforced on a multilateral basis by the United Nations. Identifiers: *Coastal zone management, Dredging.

Before the presence of man, San Francisco Bay was already being filled in by natural causes, receiving sediment from drainage basins. Along with sediment from gold mining, and effects of agriculture, salt pond construction, dredging, subsidence, fill and urbanization have greatly altered the bay system. As a result the bay is in danger of being filled in many thousands of years sooner than might otherwise be the case. The impact of man on the alteration of the bay shoreline has been grossly out of proportion to the few short years of his presence. Careful planning must now be undertaken to save the bay. The Bay Conservation and Development Commission, a permanent regulatory agency with jurisdiction over the bay and a hundred foot shoreline land around it, was created in 1965. In addition, the regional Water Quality Control Board, the State Department of Fish and Game, the United States Department of the Interior, and a number of citizen groups have an active interest in the future of the bay. AGREEMENT BETWEEN THE UNITED STATES OF AMERICA AND CANADA ON GREAT LAKES WATER QUALITY.
23 U.S.T. 201, T.I.A.S. No 7312, p 302-369, April 15, 1972.

Descriptors: *International Boundary and Water Comm., *International waters, *International commissions, *International Joint Commission, *Water quality control, Federal government, Water quality, Ships, Pollution, Water pollution, Sewage disposal, Waste control, Industrial wastes, Great Lakes, Great Lakes region, Lakes, Navigable waters, Administrative agencies, Adoption of practices, Environmental effects.
Identifiers: Administrative regulations, International agreements.

Pursuant to the Boundary Waters Treaty of 1909 Canada and the United States, concerned about the grave deterioration of water quality in the Great Lakes and St. Lawrence River, agreed in 1972 to a series of measures to be implemented by December 31, 1975. In order to control pollution from municipal sources, sewage treatment facilities will be constructed. Control of industrial waste discharge and elimination of discharge of toxic metals, organic contaminants and radioactive materials will be regulated and enforced. Shipping operations will be regulated to cut down on Great Lakes water pollution. Vessel design, construction, waste discharge and operations are to be subject to the principles of the agreement. The International Joint Commission will assist in the agreement's implementation establishing a Great Lakes Water Quality Control Board. The agreement is to remain in force at least for five years and will continue until terminated upon twelve months notice given by either party to the other. (Dillingham-Florida)

WATERSHED PROTECTION AND FLOOD PREVENTION PROGRAM AND RESOURCE CONSERVATION AND DEVELOPMENT PROGRAM--PROPOSED WATER QUALITY MANAGEMENT GUIDELINES.
Soil Conservation Service, Washington, D.C.
Federal Register, Vol 38, No 86, p 11094-11095, May 4, 1973.

Descriptors: *Water quality, *Water resources development, *Construction, *Adoption of practices, *Water management(Applied), Water conservation, Water distribution(Applied), Water resources, Watershed management, Water supply, Water storage, Environmental sanitation, Irrigation programs, Project planning, Legal aspects, Drainage systems, Permits, Coordination, Streamflow, Administration.
Identifiers: Administrative regulations.

Water quality management measures have been authorized for implementation in watershed and resource conservation and development projects pursuant to the Rural Development Act of 1972. Criteria for such assistance includes sponsorship by units of government or non-profit organizations having legal authority and financed ability to plan, install, operate, and maintain the measure. When planned in a watershed project, works of improvement must be an integral part of a project providing substantial benefits for flood prevention, irrigation, or drainage. Sponsors must show that all necessary land and water rights have been or can be obtained. All necessary permits must also be obtained. Works of improvement include measures for the enhancement of water quality to improve the environment. They include the storage of water or other facilities to augment, divert, retain, or regulate streamflow. The Soil Conservation Service will consult with the Environmental Protection Agency and the state agency responsible for pollution control to determine flow requirements. (Sperling-Florida)

Mosq News, Vol 33, No 4, p 594-599, 1973, Illus.
Identifiers: Anopheles-franciscanus, Arbovirus, *California, Culex-erythrothorax, Culex-tarsalis, Culiseta-inornata, *Distribution patterns, Encephalitis, Flavivirus, *Imperial Valley(Calif), Mosquito vectors, St-Louis, Virus.

Adult mosquito populations were monitored at 5 localities in the Imperial Valley, California, from Nov., 1971 to Oct., 1972. Culex tarsalis and Culiseta inornata were widely distributed in the areas sampled, while Culex erythrothorax and Anopheles franciscanus were limited to permanent pond habitats. SLE (Saint Louis encephalitis) virus was isolated from pools of C. tarsalis and C. erythrothorax in Aug., 1971. C. erythrothorax may be an important vector of arboviruses in the permanent pond habitat, while C. tarsalis is the most widely distributed vector.--Copyright 1974, Biological Abstracts, Inc.

A DEVICE FOR MAINTAINING CONSTANT OXYGEN CONCENTRATION IN FLOWING WATER,
Colorado Div. of Wildlife, Fort Collins.
J. O. Cochran, and W. H. Babcock.
The Progressive Fish-Culturist, Vol 36, No 3, p 177-178, July 1974. 1 fig, 1 ref.

Descriptors: *Dissolved oxygen, Equipment, Technology, *Design, Methodology, Oxygenation, Aeration, Laboratory tests, Brook trout.

A system for maintaining dissolved oxygen concentrations for low temperature oxygen trials on brook trout is described. Different concentrations of dissolved oxygen may be delivered simultaneously at independently variable flow rates. Dissolved oxygen levels obtainable in test operations were from 0.4 mg/liter to 9.0 mg/liter with a variation of plus or minus 0.2 mg/liter in a single chamber. Reoxygenation of water was achieved by mixing deoxygenated water with water containing 9.0 mg/liter to desired dissolved oxygen levels. (Katz)

A STUDY: EFFECTS OF GEOLOGY AND NUTRIENTS ON WATER QUALITY DEVELOPMENT,
Texas Univ. at Houston. Dept. of Civil Engineering.
L. J. Stone.
Journal of the American Water Works Association, Vol 66, No 8, p 489-494, August, 1974. 15 fig, 1 tab, 25 ref.

Descriptors: *Watersheds(Basins), Hydrology, *Water quality control, Environmental effects, Alkalinity, *Geology, Populations, Streamflow, Water resources, Management, *Nutrients.
Identifiers: Nutrient loading.

Two watersheds in northwest Arkansas were studied for geology and land use in order to relate stream-water-quality development to the environmental factors present in the ecosystem. Relationships established were water quality-geology and water quality-nutrient loading. Analysis included pH, alkalinity, calcium hardness, and electrical conductance of the geological formations. The areas of study contained low population density of both humans and animals. It was projected that any increase in either population will markedly increase the nutrient loadings in stream flow. Data are to be used for future basin management and water quality control. (Prague-FIRL)

ECOLOGY AND THE PROBLEM OF REHABILITATING WASTES FROM MINERAL EXTRACTION,
London Univ. (England). Dept. of Applied Biology.
G. T. Goodman.
Proceedings of the Royal Society, Series A., Vol 339, No 1618, p 373-387, August 13, 1974. 1 tab, 15 ref.

Descriptors: *Soil-water-plant relationships, *Mineral industry, *Environmental effects, *Vegetation regrowth, Metals, Plant breeding, Grasses, Resistance, Industrial wastes, *Mining, *Ecology.
Identifiers: United Kingdom.

The problems associated with mineral extraction and possible solutions to them in the United Kingdom are discussed. Problems include aesthetics, nuisance, health hazards and safety. The reclamation process of revegetation can take the following forms: plant highly tolerant vegetation, improve the soil at poor sites, or pre-plan excavation procedures to dump or bury harmful wastes deeply. Common spoil materials are listed with characteristics of inhibitors to revegetation. Slippage of material down a hillside, spontaneous combustion of smelter wastes, slopes too steep to work with machinery, fluctuating water supply, soil which has been compacted, temperature extremes from dark colored wastes, wind turbulence, deficiency of nutrients, stony ground, broken, uneven surfaces, erosion and absence of soil organisms are factors delaying or eliminating revegetation. The inhibitory effects of toxic materials are discussed in more detail. Toxic metals can be dealt with by pH adjustment, complexation with organic matter, or planning genetically metal-tolerant populations of common grasses. (Pulliam-Vanderbilt)

GREAT LAKES WATER QUALITY, 1973 ANNUAL REPORT TO THE INTERNATIONAL JOINT COMMISSION.
International Joint Commission-United States and Canada. Great Lakes Water Quality Board.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-233 187, $5.25 in paper copy, $2.25 in microfiche. Report No IJC/DOS-7401, April 1974. 115 p, 4 fig, 15 tab, 3 append.

Descriptors: *Water quality, *Great Lakes, *International Joint Commission, *United States, *Canada, *Programs, Evaluation, Lake Superior, Lake Michigan, Lake Huron, Lake Erie, Lake Ontario, Monitoring, Eutrophication, Water pollution sources.
Identifiers: Lake St. Clair.

An assessment of the present water quality of the Great Lakes and their connecting channels was provided and the data collection and analysis programs available for this evaluation were critically examined. The status of remedial programs being implemented to achieve the objectives for water quality in the lakes as agreed to under the 1972 Canada-United States Agreement was reviewed. Progress in reducing pollution from municipal waste discharges was highlighted. While significant progress is being made, particularly with regard to reducing phosphorus inputs to control eutrophication, several major sewage treatment facilities will not be completed by 1975. (Humphreys-ISWS)

EFFLUENT NEIGHBORS: THE MEXICO-UNITED STATES WATER QUALITY DILEMMA.
California Western International Law Journal, Vol 3, p 152-172, 1972. 114 ref.

Descriptors: *United States, *Mexico, *International law, *Riparian rights, *International waters, Water pollution, Water pollution sources, Water pollution control, Water quality, Water quality control, Legal aspects, Water law, Water rights, Legislation, Treaties, Reasonable use, Relative rights, Water utilization, Rivers, Drainage systems, Colorado River, Rio Grande River, Adoption of practices, Administration, Judicial decisions.

When a river becomes polluted, the contamination is not hindered by political demarcation but destroys the quality of the entire river to the detriment of all riparians and users of the water. The United States and Mexico share three international drainage basins, the Rio Grande, Colorado, and Tijuana river systems. The pollution regulated by international law is generally that which is the result of an injurious use. Traditionally, the rights of co-riparians to use an international stream included the right to pollute provided that the polluting use would not harm a co-riparian or his use of the waters. The weight of authority considers 'equitable utilization' the predominant use doctrine with respect to both contiguous and successive international rivers. But it is unclear whether it is more effective to apply this principle on the administrative or the adjudicative level. The above concepts can be used to analyze water quality provisions of national and international laws of both Mexico and the United States. (Ritchie-Florida)

ESTUARIES OF OREGON-ECOSYSTEMS IN CRISIS, PROBLEMS AND LEGAL SOLUTIONS,
S. R. Schell.
Environmental Law, p 83-103, Vol 2, No 1, Winter, 1971. 71 ref.

Descriptors: *Estuaries, *Oregon, *Legislation, *Administrative agencies, *Water quality control, Estuarine environment, Navigable waters, Coastal areas, State governments, Federal government, Fisheries, Wildlife, Conservation, Natural resources, Water resources development, Recreation, Industrial wastes, Sewage discharge, Pollutants, Channelization, Submerged lands, Water policy, Water utilization, Water management.

Problems of estuaries in Oregon are discussed. Oregon's estuarine land is composed of 56,000 acres out of a total land area of 61.6 million acres, yet over 1,000 acres of this non-renewable resource have been filled in the last ten years. Oregon's commercial fishing industry is totally estuarine dependent. Each estuary in Oregon has a different salt-water/fresh-water mix, nurturing various plant and animal species. Conflicting use requirements compound the estuarine problems. Navigation demands channelization, dredging and filling, as well as waste disposal. Logging and industrial wastes contribute to the pollution problems. Landfill is the most immediate problem facing the estuary. The federal government regulates landfills of this nature through the permit system operated by the Army Corps of Engineers. State agencies supplement the federal action by regulating non-navigable waters and the control, management and disposition of submerged lands which comprise a great part of the estuarine environment. The Fish Commission regulates and prevents pollution discharges which will adversely affect fishery development. Federal and state agencies also have the power to regulate and control water quality through the regulation of discharges of waste, sewage and pollution. (Silber-Florida)
W75-03678

NEW LEGISLATION FOR WATER QUALITY.
Resources, Vol 42, No 42, p 2-4, January 1973.

Descriptors: *Legislation, *Water quality, *Water pollution control, *Water quality control, *Water pollution, Permits, Legal aspects, Effluents, Water pollution sources, Wastes, Water policy, Water law, Penalties(Legal), Regulation, Federal government.
Identifiers: Federal Water Pollution Control Act Amendments of 1972.

The effect of recent legislation on federal water pollution control programs is discussed. The Federal Water Pollution Control Act Amendments of 1972 broaden the scope of the federal program. The amendments represent a shift from effluent standards keyed to ambient water quality standards to direct imposition of effluent standards that are not connected with environmental conditions. Two national goals are set forth in the act the elimination of the discharge of pollutants into the navigable water by 1985 and the attainment of an interim goal of water quality by 1983. An emphasis is placed on research, demonstration and education projects. The act also provides for increased matching grants for construction of publicly owned waste treatment plants and increased use of the permit system. The act provides that permits can be issued by states whose criteria and procedures have received federal approval. (Gragg-Florida)

ENVIRONMENTALISTS ATTACK ADMINISTRATION, INDUSTRY PLANS TO WEAKEN NEPA AND SET BACK RECENT CLEAN AIR GAINS.
Wilderness Report, p 3, April 1974.

Descriptors: *Water pollution, *Pollution abatement, *Administrative decisions, *Water management, *Water law, Conservation, Clean Air Act, Administration, Organizations, Federal government, Regulation, State governments, Water quality, Environment, Environmental effects, Standards, Pollutants, Water pollution sources, Air pollution.
Identifiers: National Environmental Policy Act(NEPA), Energy crisis.

The Nixon Administration is proposing legislation that would extend the deadline for industry compliance with air quality standards and would permit the use of 'intermittent controls' by stationary sources of air pollutants, such as power plants. The Wilderness Society, National Wildlife Federation, National Audubon Society, Izaak Walton League and the American Forestry Association have mounted an attack against the efforts of the Administration to undermine the Clean Air Act and other environmental legislation. The groups maintain that profit margins are more than adequate to cover the costs of pollution abatement and although temporary variances were permissible during the energy crisis, any long term variances are unacceptable. The effect of variance

would weaken the National Environmental Policy Act and the Clean Air Act. Russell Train, chairman of the Environmental Protection Agency, and Russell Peterson of the Council on Environmental Quality have both come out strongly against attempts to weaken the laws. Should Mr. Train and Mr. Peterson not be able to stiffle the proposals to weaken the laws, it will be the duty of Congress to take action. (Barnes-Florida)

WATER STRATEGY PAPER HIGHLIGHTS EPA POLICIES.
Pollution Control Guide, Vol 3, paragraph 19783, p 19357-19371, 1974. (Reprint of EPA Water Quality Strategy Paper by Russell Train, Administrator).

Descriptors: *Water pollution control, *Federal Water Pollution Control Act, *Legislation, *Administration, Water policy, Administrative agencies, Decision making, Adoption of practices, Standards, State governments, Local governments, Oil spills, Oceans, Political aspects, Coordination, Fishing, Recreation, Water quality standards, Administrative decisions, Federal government.
Identifiers: FWPCA Amendments of 1972, Effluent limitations, Hazardous substances(Pollution).

The Environmental Protection Agency's policies in administering its water pollution control programs have been published in the Water Quality Strategy Paper. Issues addressed by the paper include the basis for effluent limitations, permits and compliance, municipal construction, antidegradation, non-point source pollution control, spills of oil and hazardous materials, and the protection of ocean and ground water. The two laws with which the strategy paper are concerned are the 1972 Amendments to the Federal Water Pollution Control Act and the Marine Protection, Research and Sanctuaries Act of 1972. The Federal Water Pollution Control Act begins a ten year program which aims at the achievement throughout this country, by 1983, of waters in which we can swim and fish. The strategy paper also functions as an exposition of policies that may be implemented in the future. An important role is envisaged for the states in carrying out this legislation not only because of the magnitude of pollution control efforts that are necessary, but also because of the special and localized nature of many problems. (Sperling-Florida)
W75-03691

WATER PROGRAM POLICY ISSUES, (EPA POLICY DIRECTIVES).
Pollution Control Guide, Vol 1, paragraph 2413, p 2222-2227, 1973.

Descriptors: *Permits, *Adoption of practices, *Decision making, Administration, *Administrative agencies, *Water pollution control, *Water quality standards, Water law, Regulation, Waste water disposal, Water quality control, Environmental sanitation, Industrial waste, Monitoring, Federal government, Water policy.
Identifiers: Effluent limitations, Administrative regulations.

There has been confusion over priorities for issuing permits. There are deep and unproductive disputes between Water Quality Standards and best practicable technology as a basis for issuing permits. The law requires that all permits be issued by December 31, 1974. Permits are issued on a best practicable technology basis, or, if more stringent controls are needed to protect water quality on a water quality standard basis. Even if water quality standards are the basis for a permit, the permit will issue on a best practicable technology basis, anyway, if the water quality analysis cannot be completed in time to meet the December 31, 1974 deadline. To do otherwise would be to put a permittee in violation of the law through an inability to complete the analysis. The priority is to work first on permits which already have, water quality standard based, load allocations or where best practicable technology based permits will definitely be written. (Sperling-Florida)
W75-03692

EXPLANATORY STATEMENT: IMPLEMENTATION OF NPDES, (EPA).
Pollution Control Guide, Vol 1, paragraph 2414, p 2227-2244, 1973.

Descriptors: *Permits, *Administrative agencies, *Adoption of practices, *Water law, Regulation, Government finance, Federal government, Water pollution control, Water policy, Planning, Water quality, Treatment facilities, Water treatment, Decision making, Administration, Water quality standards, Water quality, Abatement, State governments, Legislation.
Identifiers: *FWPCA Amendments of 1972, *Administrative regulations.

Information regarding the national permit system was released by the Environmental Protection Agency (EPA) to the public in an explanatory statement. Main features of the permit system are summarized, including the principal aspects of the statute, important regulations that have been promulgated or are being developed, and major policy directives. The background of the program is described and other factual information concerning the scope of the program and the manner of its implementation and operation is discussed. Since the issuing of the explanatory statement in this article, the EPA has adopted a policy to issue environmental explanations of major standards, regulations and guidelines established by the Administrator. The Federal Water Pollution Control Act Amendments of 1972 provide new enforcement tools for fighting pollution and increased federal grants for construction of waste treatment facilities. (Sperling-Florida)

TRANSLATIONS ON ENVIRONMENTAL QUALITY NO. 8.
Joint Publications Research Service, Arlington, Va.
Available from National Technical Information Service, U.S. Dept of Commerce, Springfield, Va 22161 as JPRS-61111, $4.25 in paper copy, $2.25 in microfiche. January 31, 1974, 50 p.

Descriptors: *Environmental control, *Pollution, *Ecology, *Meteorology, Water quality, Water quality control, Water pollution, Air pollution, Pollution sources, Pollution abatement, Water pollution control, Environmental sanitation, Water supply, Wastes, Sewage, Sewage treatment, Governments, Water resources development, Water law, Environmental effects, Legislation.
Identifiers: *Environmental policy.

Translations are presented from the world press of articles and press commentary on environmental pollution and its effects. Also discussed are pollution control technology, organizations and programs. The articles were written by authors from Eastern Europe, Latin America, the Near East and Africa, and the Soviet Union. With the development of the economy, forces of production and scientific technology, steps must be taken to preserve and enhance environmental quality. Engineering systems to aid in water and air pollution abatement have been developed. Despite the international energy crisis and problems of inflation several nations have undertaken concerted efforts to fight the contamination of the atmosphere by industrial pollutants. Among these control mechanisms have been the introduction of dust collection equipment to control emissions in cement plants. (Proctor-Florida)

OCEAN DISPOSAL PRACTICES AND EFFECTS (REPORT OF MEETING HELD IN NEW YORK ON SEPTEMBER 26-29, 1972).
President's Water Pollution Control Advisory Board, Washington, D.C.
Available from National Technical Information Service, U.S. Dept of Commerce, Springfield, Va 22161 as PB-229 808, $4.75 in paper copy, $2.25 in microfiche. September 29, 1972. 71 p, 30 ref, 5 tab, 5 append.

Descriptors: *Oceans, *Waste disposal, *Planning, *Water pollution control, *Federal government, Evaluation, Water pollution sources, Water pollution effects, Water policy, Water law, Governments, Water pollution, Water quality, Water quality standards, Coasts, Disposal, Sewage disposal, Comprehensive planning.
Identifiers: Coastal waters, Contiguous zone, Effluent limitations, Territorial seas(Jurisdiction), Environmental policy, FWPCA Amendments of 1972.

The President's Water Pollution Control Advisory Board met on September 26-29, 1972, to discuss the problem of ocean dumping pollution and to explore alternatives to ocean disposal of wastes. This report contains the official account of this meeting, including information received by the Board from representatives of federal, state and local government and various experts in the field of ocean disposal. The following are the principal recommendations made by the Board: (1) the immediate enactment of the Marine Protection, Research and Sanctuaries Act and Federal Water Pollution Control Act Amendments of 1972; (2) the establishment of Federal Water Quality Standards for the waters of the contiguous zone; (3) the establishment of pretreatment standards for industrial wastes discharged into municipal sewage systems; (4) completion of an inventory of the ocean bottom and coastal waters of the United States and its territories; (5) land disposal of dredge spoil where possible; (6) immediate action to curb the disposal of raw sewage into the ocean; (7) establishment of regional systems for the regulation and control of the coastal waters; and (8) increased research into the effects of ocean disposal pollution and the establishment of appropriate water quality standards. THE NEW FEDERAL WATER POLLUTION CONTROL LAW,
George Washington Univ., Washington, D.C.
A. W. Reitze, Jr., and G. Reitze.
Environment, Vol 15, No 1, p 19-20, January/February 1973.

Descriptors: *Pollution abatement, *Water pollution control, *Environmental effects, *Enforcement, *Federal Water Pollution Control Act, Rivers and Harbors Act, Navigable waters, Legislation, Legal aspects, Administrative decisions, Administration, Federal government, Water pollution, Pollution control, Water law, Water policy, Adoption of practices.
Identifiers: Refuse Act of 1899, National Environmental Policy Act, Licenses, Adminstrative regulations.

Prior to the Federal Water Pollution Control Act (FWPCA) amendments legislation was ineffective in cleaning up the waters of the U.S. Administrative processes were too cumbersome and time consuming. The FWPCA is made more functional, subsuming nearly all federal law in this field and superceding the state programs except that existing state standards are continued. The scope of FWPCA amendments extends to all U.S. navigable waters. The discretionary powers of the administrator of the Environmental Protection Agency, are more extensive. Despite the overall positive aspects of the FWPCA amendments two major factors prevent this law from being as effective as it could be. First, the enforcement system of the act will not be functional for several years. Second, the permit system used by the 1899 Refuse Act is incorporated into the new act. Thus, all who had applied for a permit are immune from prosecution until their application is processed. (Chennault-Florida)

POLLUTION SUCTION WATER SWEEPER,
J. DiPerna.
US Patent No 3,847,816, 3 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 928, No 2, p 745, November 12, 1974.

Descriptors: *Patents, *Oil pollution, *Oil spills, Water quality control, *Water pollution control, Equipment, *Skimming, Separation techniques, Pollution abatement.
Identifiers: *Suction water sweeper.

The pollution suction water sweeper consists of an oil tanker having a series of oil collection tanks and a floating harvesting ring towed in front of the ship by director tugs that are electronically controlled from the ship. The harvesting ring is pulled so as to gather up the oil. The ring consists of a flexible empty accordian-like hose at each end with an apron having weights to hold down the bottom of the apron. Between the ends of the ring, a central portion forms a skimmer and consists of a wide hose. The hose has a series of slotted vertical openings on the front side so that the oil slick can enter. The skimmer is connected to two flexible hoses that pass through openings in the hull and into the ship hold. Gravitation may be employed to move the collected mixture of water and oil to the tank which is below the level of the water. (Sinha-OEIS)
W75-03733

ROTARY SKIMMER,
Sun Oil Co., Philadelphia, Pa. (assignee)
G. D. Aulisa.
US Patent No 3,844,950, 4 p, 5 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 2096, October 29, 1974.

Descriptors: *Patents, *Flotsam, *Skimming, *Oil pollution, *Oil spills, *Water pollution control, Water quality control, Pollution abatement, Equipment, Separation techniques.
Identifiers: *Skimmers.

A device for removing floatable material from the surface of a body of water is described. An elongated skimming blade is mounted for rotation, about a vertical axis, across the surface of a liquid, and is rotated about this axis by means of a suitable propulsion device. A collection trough attached to the blade serves as an accumulation means for the skimmed material. A float whose buoyancy is adjustable maintains the blade in a predetermined position relative to the liquid surface, the float being anchored to the bed of the body of water being skimmed. The whole constitutes a portable rotary skimmer. An air supply or inlet pipe carrying compressed air is coupled through a conventional control valve (operable from outside the housing) to a hose connection which goes to the outer end of the pipe. The valve thus serves to control the flow of compressed air to the jet propulsion devices which cause rotation of the skimming blades, together with their attached collection troughs. (Sinha-OEIS)
W75-03736

PROTECTED OFFSHORE STORAGE FACILITY,
Pittsburgh-Des Moines Steel Co., Pittsburgh, Pa. (assignee)
W. E. Bliss, Jr.
U. S. Patent No. 3,844,122, 5 p, 15 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 927, No 5, p 1838, October 29, 1974.

Descriptors: *Patents, *Oil pollution, *Water pollution control, Water quality control, *Oil, *Pollution abatement, *Storage tanks, Facilities.
Identifiers: Crude oil, Offshore storage facilities.

A protected area is provided in a body of water which is subject to wave and tide action and tanks for storing crude oil and the like are moored in the protected area. The tanks are floating tanks and have fixed roofs. The use of a fixed roof instead of a floating roof eliminates the peripheral seals required between a floating roof and the side wall of the tank. The oil or the like stored in the tanks actually supports at least a portion of the weight of the roof and tank, and the unit pressure acting on the surface of the stored liquid is thus greater than that resulting from a standard floating roof. This increase in unit pressure in conjunction with the elimination of the peripheral seal results in a virtually complete prevention of any out-gassing evaporation of the light ends of the stored oil or other liquid. (Sinha-OEIS)

ENFORCEMENT UNDER THE FEDERAL WATER POLLUTION CONTROL ACT AMENDMENTS OF 1972,
Environmental Protection Agency, Denver, Colo. Region VIII.
H. W. Ipsen, and J. W. Raisch.
Land and Water Law Review, Vol 9, No 2, p 369-420, 1974.

Descriptors: *Federal Water Pollution Control Act, Legislation, Legal aspects, Water pollution control, Cities, Industries, Jurisdiction.
Identifiers: Enforcement.

The 1972 Amendments to the Federal Water Pollution Control Act were passed in an effort to obtain more effective and expeditious attainment of the national goal of cleaning up the country's waters. The various standards and requirements required for compliance with the Act as well as the means which are available for enforcement are described. The jurisdictional and other procedural aspects of enforcement of the Act are discussed in addition to the various civil and criminal remedies which may be used in cases of non-compliance with the provisions of the Act. The impact of the new enforcement options on the Environmental Protection Agency is explained and an appeal is made for future voluntary compliance with the Act by affected industries and municipalities.

CONTROL OF SALT-MARSH MOSQUITOES WITH ABATE INSECTICIDE AT COOMBABAH LAKES, QUEENSLAND, AUSTRALIA,
Queensland Inst. of Medical Research, Herston (Australia).
B. H. Kay, K. J. Ferguson, and R. N. C. Morgan.
Mosq News 33(4): 529-535, 1973.

Descriptors: *Insecticides, Pesticides, *Australia, Mangrove swamps, *Mosquitoes, *Salt marshes, Pollution abatement, Water pollution control.
Identifiers: *Abate insecticide, Aedes-vigilax, *Coombabah Lakes(Aust), Culex-annulirostris, Culex-fatigans, Culex-sitiens, Queensland.

Four and 4.4% Abate insecticide-sand granule formulations, each applied aerially at 1 lb of formulated product/acre, were 91% and 71% effective against larval Aedes vigilax Skuse and Culex sitiens Wiedemann respectively in a 1971 trial. In 1972, even higher mortalities were indicated. At the dosages used, Abate insecticide caused minimal mortality of non-target organisms tested in natural salt-marsh conditions. Ninety-nine percent kill of larval C. annulirostris Skuse and 87% mortality of C. fatigans Wiedemann exposed in small containers were also recorded. The granules penetrated dense mangrove cover and open country with equal efficiency. A successful application was carried out during a 15-20 knot wind. The insecticide had little residual life in stimulated salt-marsh conditions.--Copyright 1974, Biological Abstracts, Inc.

6A. Techniques Of Planning

USE OF INTERACTIVE COMPUTER GRAPHICS IN WATER RESOURCES PLANNING AND MANAGEMENT,
Connecticut Univ., Storrs. Inst. of Water Resources.
Y. T. Chien.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 631, $3.25 in paper copy, $2.25 in microfiche. Completion Report, 1974. 16 p, 10 fig, 7 ref. OWRT A-042-CONN(5). 14-31-0001-3507.

Descriptors: *Computer programs, *Computer models, Water resources, *Planning, *Management, *Graphical techniques, Hydrologic data, Remote sensing, *Algorithms, *Graphical analysis, Graphical methods, Model studies, Massachusetts.
Identifiers: Computer graphics, Man-machine interaction, Display-oriented algorithms, ERTS imagery, Hydrological event delineation, Recursive applicability, Cape Cod Canal(Mass).

An experimental graphics system was developed to evaluate its usefulness in the area of water resources planning and management. The system included a conceptual model and a large number of computational techniques, operational programs, and utility routines. A class of display-oriented transformational algorithms were studied in relation to the NASA ERTS imagery. By combining several spectral bands of information, the possibility of delineating various classes of hydrological events (water, land, etc.) in a man-machine environment was examined. The results of a limited experimentation with a section of the Cape Cod Canal and its adjacent land indicate that (a) with the aid of a computer display, the human operator can play a direct and immediate role in selecting and analyzing the portions of the data of particular interest, and (b) speedy display and user's interaction may be achieved by putting the transformational algorithms in a recursive structure. This recursive applicability will allow the algorithms to be applied to expanded data bases without introducing excessive calculations. (de Lara-Connecticut)

Descriptors: *Water resources, *Planning, *Mathematical models, *Management, *Regional analysis, Optimization, Methodology, Model studies.
Identifiers: Multilevel approach, *Hierarchical modeling, Decomposition, Multilevel coordination, Supply scheduling model, Demand economic model, Co-ordination model, *North Atlantic Region.

The development and analysis of an economically-based methodology for long-range planning of regional water resource systems are discussed. Hierarchical modeling, which accounts for the complexity of regional considerations, consists of two main broad categories of techniques and structural representations. First, decomposition is the term applied to the class of techniques used to divide a complex system into smaller more easily handled components. Second, multilevel coordination complements decomposition models since it is usually necessary to account for the interactions decoupled when a complex system is decomposed. The purpose of multiple levels of optimization, simulation or control is to coordinate the decomposed solutions so that the overall sum of solutions meets a particular goal or objective. Methods of decomposition and multilevel coordination, as well as a method for solving multiple objectives, are discussed. The major planning model discussed is decomposed into three major components, supply (cost) scheduling model, demand (benefit) economic model, and co-ordination model. The North Atlantic Region, which includes all or portions of 13 states and the District of Columbia, was selected for testing the methodologies and models developed in the study. A goal has been the maximum utilization of models, data, and experience developed and obtained by the North Atlantic Region study. (Diefendorf-North Carolina)

ENERGY EVALUATION OF WATER MANAGEMENT ALTERNATIVES IN THE UPPER ST. JOHNS RIVER BASIN OF FLORIDA,
Environmental Protection Agency, Gainesville, Fla.
S. Bayley, and H. T. Odum.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-227 051, $5.25 in paper copy, $2.25 in microfiche. May 1973. 114 p, 19 fig, 15 tab, 62 ref.

Descriptors: *Water management, *Water conservation, *Energy, *Ecosystems, *Marshes, *Decision making, Land use, Planning, Cost-benefit analysis, Reservoirs, *Florida, Model studies, Water levels, Flood plains.

Identifiers: *St. Johns River Basin(Fla), Brevard County(Fla), Energy value, Energy evaluation, Energy amplifier factors, Channelization, Development trends, Energy circuit model.

A section of the upper St. Johns River basin was selected as a pilot test of energy evaluation procedure for decision making. Energy value calculations were made for present and primitive conditions and 3 alternatives for water management: a pattern of private channelization of lands for agriculture and housing; a reservoir plan that sends more water to agriculture and urban use in other districts; and a plan that retains the floodplain for water conservation areas. Proposed changes in water management and land use shift the distribution of energy values and thus change the totals of energy generated by regional scale interactions of lands, waters, cities, and outside sources of money and energy. The pilot area calculations suggest energy amplifier factors for water for alternatives of marsh use, lightly managed pasture and intensive agriculture, and urban development based on water-using industries, on light industry, and on tourism and retirement. The energy cost-benefit approach used avoids several fallacies common to other evaluations of environmental change. By considering the total system, the deceptively high amplifier effects of processes examined in isolation are avoided. Using this approach calculations showed the plan for retention of marshes produced the highest total annual energy value, suggesting this plan as the one most favorable to economic vitality. The lowest values were found with further private channelization and development of the kind of agricultural production now practiced. (Diefendorf-North Carolina)

DISPLACEMENT OF PERSONS BY MAJOR PUBLIC WORKS, ANTHROPOLOGICAL ANALYSIS OF SOCIAL AND CULTURAL BENEFITS AND COSTS FROM STREAM CONTROL MEASURES---PHASE 5,
Kentucky Water Resources Research Inst., Lexington.
P. Drucker, C. R. Smith, and E. B. Reeves.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 627, $5.25 in paper copy, $2.25 in microfiche. Research Report No 80, December 1974. 100 p, 4 tab, 16 ref, append. OWRT A-046-KY(1). 14-31-0001-3817.

Descriptors: *Social change, *Social impact, *Human population, *Relocation, Planning, Evaluation, Benefits, Costs, Utilities, Area redevelopment, Compensation, Public benefits, *Migration, *Social adjustment.
Identifiers: Emigration(Human), Cultural adaptation(Human), *Anthropological analysis.

This study is concerned with social change and social impact of a major public works project on the human population required to relocate the persons being forced to sell to the Federal Government or turn over through condemnation proceedings homes, farms, and/or businesses to facilitate completion of a Federally authorized stream control measure. It is intended to test the utility of anthropological method and concept in evaluating and explicating sociocultural impact, and in addition to check hypotheses concerning importance of impact on social and economic areas of culture of the persons to be displaced, on their emigration patterns, and their cultural adaptation, and other social effects of relocation. Application of anthropological concepts and methods yield more intelligible results than sociological studies based on data generation through highly artificial questionnaire methods with attempted quantification of what are basically non-quantifiable data. This does not mean that simple counts and raw percentage comparisons are not significant to demonstrate trends, but that complex arithmetic computations are often used to imply a degree of precision that does not exist and explains nothing. Social scientists, planners and change agents must come to realize that there are aspects of the quality of human life which must be considered which cannot be defined in numbers. (Grieves-Kentucky)

FACTORS INFLUENCING PARTICIPATION IN RECREATION ACTIVITIES IN SOUTHEAST IOWA, AND CAMPER ATTENDANCE AT MACBRIDE STATE PARK,
Iowa Univ., Iowa City. Recreation Education Program.
M. Glascock.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 630, $3.75 in paper copy, $2.25 in microfiche. Supplement to Completion Report, May 30, 1973. 24 p, 11 tab. OWRT B-017-IA(3).

Descriptors: *Recreation demand, *Motivation, *Iowa, Recreation, *Social participation, Social value, Decision making, *Surveys, Camping.
Identifiers: Linn County(Iowa), Johnson County(Iowa), Macbride State Park(Iowa).

Factors influencing individuals' involvement in recreation were evaluated through a mail survey conducted in two southeastern Iowa counties. The questionnaire consisted of a list of 72 recreational activities and questions which covered socioeconomic and demographic characteristics. Results indicated that the five most popular activities were passive in nature and take place within the home. These include reading, listening to the radio or music, and watching television. The most popular outdoor activities include pleasure walking, gardening, pleasure driving, swimming, and bird watching. Individuals with higher educational levels were more likely to engage in tennis, golf, sailing, civic work, or attend concerts. A majority of the recreational activities surveyed were not related to sex, age, marital status, occupational status, income level, or residential location. Results of a 1970 study of campers in Iowa's Lake Macbride State Park, utilizing data obtained from camping permits, are also summarized. A majority of the campers were from Iowa with five counties contributing over 1000 camper days in 1970. There was a strong linear increase in camping through July followed by a decline beginning in August. (Schroeder-Wisconsin)

AN ANALYSIS OF SOCIAL WELL-BEING CHANGE ASSOCIATED WITH RESOURCE DEVELOPMENT PROJECTS IN WYOMING,
Wyoming Univ., Laramie. Water Resources Research Inst.
M. Hackbart, G. Long, and M. York.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 634, $5.25 in paper copy, $2.25 in microfiche. Research Project Report, June 1973. 115 p, 15 fig, 28 tab, 24 ref, 2 append. OWRR A-002-WYO(7).

Descriptors: *Cost-benefit theory, *Water resources development, Planning, Measurement, Social impact, Social change, Welfare(Economics), *Wyoming, US Water Resources Council, Evaluation.
Identifiers: *Social well-being, Economic evaluation.

A recent Water Resources Council Task Force recommendation to include social well-being (SW) as an objective in addition to national economic development for water resource development projects is assessed and a series of proxies to measure social well-being are evaluated for several water resource development projects in Wyoming. The choice of proxies is important because SW cannot be measured directly. An appropriate selection should yield operationally meaningful (capable of identifying change) and feasible (those with data available) proxies. Four general categories of proxies to measure the changes in SW were evaluated: (1) real income changes and distributional impact measurement changes in per capita income, changes in the percentage of households over the poverty line, and changes in the Lorenz curve or Gini ratio; (2) changes in population; (3) changes in economic stability through an entropy measure of employment stability; and (4) changes in educational or recreational patterns. Results of comparing Wyoming counties with and without such projects reveal no consistent proxy variation pattern. The implication appears to be that the projects had not significantly changed the project region's SW, although data difficulties make this inconclusive. Appendix A provides an overview of the major river basins in Wyoming. (Schroeder-Wisconsin)

ECONOMIC EVALUATION AND DETERMINATION OF PLANT CAPACITY AND DAM HEIGHT,
Public Power Corp., Athens (Greece).
D. A. Xirokostas.
Water Power, Vol 26, No 1, p 17-22, January 1974. 6 fig, 5 ref.

Descriptors: *Cost-benefit theory, *Hydroelectric plants, Economic efficiency, Prices, Hydroelectric power, Peak loads, Peaking capacity, Costs, *Cost-benefit ratio, *Dam design, *Optimization, *Alternative costs, Evaluation.

A new benefit-cost ratio method for comparing different hydroelectric plants is devised to yield optimum dam height and installation capacity value. The new ratio is given by the ratio of the annual cost of the alternative plant plus the annual cost of replacing secondary energy (benefits) divided by the annual cost of the hydroelectric plant. Annual cost of the alternative thermal plant is determined through examination of the resultant costs to provide similar primary energy levels. Costs of secondary energy are assessed separately utilizing the average incremental costs of fuel consumed in a system of oil-fired steam turbines. In the past capacity of the hydrostation was chosen so that the costs of output are minimal. This criterion is unsatisfactory because of its failure to account for peak-load needs or its load duration curve. In essence, it assumes a unique price of energy for all bonds of power on the load duration curve. The appropriate approach suggested to determine capacity would equate the incremental cost of the hydroelectric station and the alternative thermal plant. Height of the dam is also varied under the model to maximize the difference between benefits and costs of the proposed system. (Schroeder-Wisconsin)

POPULATION GROWTH, RESOURCE AVAILABILITY AND ENVIRONMENTAL QUALITY,
Resources for the Future, Inc., Washington, D.C.
J. L. Fisher, and R. G. Ridker.
American Economic Review, Vol 63, No 2, p 79-89, 1973. 1 fig, 2 ref.

Descriptors: *Environmental effects, *Growth rates, *Population, Resources, Mathematical models, Natural resources, Environmental gradient, Social aspects, Costs, Model studies, *Mathematical models.

Results of a recent Resource for the Future (RFF) study concerning the interrelationship of population, growth, natural resource demand, and environmental quality parameters are summarized. The study dealt with a selected number of raw material, pollutant, and environment pressures associated with both population and economic growth in the U.S. over a 30-50 year period. Four sets of high-low combinations of population and economic growth are traced through a mathematical model to reveal impacts of specified resources and environmental measures and on specific sectors, e.g., agriculture or energy. Modeling results indicate the U.S. is unlikely to experience a truly serious raw material shortage (defined as a greater than 50 percent relative price increase for a significant number of factors) over the study period. Several critical factors affecting the above results are noted. These include the time period of the study, the geographic region selected, regional development characteristics, institutional arrangements, and technical changes. Costs of carrying out policies to clean up the environment were relatively inexpensive. Implications of full cost raw material pricing, improved reclamation and recycling technics, and better planning and management procedures are also discussed. (Schroeder-Wisconsin)

Descriptors: *Water resource development, *Marginal costs, Optimum development plans, Regional development, Foreign projects, Foreign countries, Water supply, Industries, *Costs, *Estimating.
Identifiers: *USSR.

A preliminary water resource development plan to meet projected water demands in the Soviet Union over the next three decades is outlined. Marginal cost estimates are also provided representing the minimum incremental development costs of a particular river system per additional disposable water resource in a given area. Water requirements for a region are based on forecasts of increased water usage corresponding to relatively moderate rates of irrigation development (30 million hectares by 2000). Proposed river development projects were based on technical, economic, and planning data obtained from the appropriate engineering design and scientific research institutes. Results of the marginal cost estimates varied significantly among regions ranging from 0 to over 25 kopecks/cubic meter. The wide divergence will affect location plans to many industries, especially those heavily water-intensive industries where water costs represent 40-50% of the total cost differences between locations. Descriptors: *Regional economics, *Water resources development, *Economic impact, Regional analysis, Regional development, *Investment, Planning, Data collections, Boundary processes, Econometrics, Cost-benefit analysis, *Rocky Mountain Region, Arizona, New Mexico, Colorado, Utah, Wyoming.
Identifiers: Economic growth.

Three studies involving: (1) development and growth analysis of subregions within defined study areas; (2) community case studies; and (3) public investment analysis are utilized to examine and conceptualize the relationship of regional growth and water and other public economic development investments. The study areas include 21 subregions in Arizona, Colorado, New Mexico, Utah, and Wyoming and communities presently receiving Bureau of Reclamation water. Central to the approach is recognition that project impacts do not coincide with political boundaries. To compensate, multi-locational relationships of population, economics, and physical characteristics were used to develop new investigation regions. Case studies indicate that water resource investment is only one of several factors affecting growth, and its impact varies in size and location over time. Subregional analysis also indicates that population, urban centers, accessibility, environmental factors, available institutional resources, markets, and technological characteristics affect growth patterns. Three econometric investment analyses of the relationship between regional economic activities, employment, population growth, and public investment indicate that water-related investment affects both the level of economic activity and growth; with the latter's effect dependent on the state of the regional economy and the presence of other non-water investments. RECONCILING CONFLICTS AMONG DIFFERENT ECONOMIC INTEREST GROUPS IN THE MANAGEMENT OF FISHERIES,
Fisheries and Marine Service, Ottawa (Ontario).
W. C. MacKenzie.
Journal Fisheries Research Board of Canada, Vol 30, No 12, Pt 2, p 2065-2069, 1973. 6 ref.

Descriptors: *Fisheries, *Fish management, Fish harvest, Economic efficiency, Planning, Optimum development plans, International waters, Treaties, *Marginal costs, Management.
Identifiers: *Social costs.

It is argued that the diverse interests involved in fisheries can best be served if fish are harvested to the point where the marginal social resources equal the marginal social cost. Often, the implementation of such policies by regulatory agencies are made after the industries' development. A rational management approach in such cases should assure that it does not contribute to the distortion of imputs, that it does not diminish technological innovation, it is capable of being applied at varying rates for different grounds and seasons, it is capable of being imposed gradually to minimize industrial disruption, and it does not discriminate against any unity of the fishing fleet. Management of fisheries is complicated because fleets of many countries may harvest the same ground. Countries often place differing values on capital, labor, and the fishery output creating difficulties in establishing a unified management approach. For the present, establishment of annual catch quotas for interested countries appears to be the most reasonable solution. The setting of quotas among countries is fraught with difficulties. Several alternative methods to reconcile the conflicts arising among fishing nations are discussed including quota-shore trading, compensation for abstention, and exchange of (fleet and port) services. GREAT LAKES-ST. LAWRENCE SEAWAY SYSTEM AND THE MID-CONTINENT ECONOMY,
Great Lakes Basin Commission, Ann Arbor, Mich.
L. J. Goodsell.

Water Resources Bulletin, Vol 8, No 5, p 1061-1067, 1972.

Descriptors: *Great Lakes, Environmental effects, Economics, Regional development, Navigable rivers, *Income, Institutions, *Transportation, *St. Lawrence River, Inland waterways, River basin development.

Since the time of early explorers, the Great Lakes-St. Lawrence River complex has represented a major link in the U.S. transportation system. Three aspects surrounding the complex are explored: (1) the economic impacts, (2) environmental impacts, and (3) the institutional milieu. Since 1966, seaway traffic has grown from 49 million tons to 51.1 in 1970 (44.6 in bulk and 6.5 in general cargo). A summary of several recent studies indicates total direct and indirect income resulting from the complex's activity came to $643 million in 1968 and provided employment for over 85,000 families. Several environmental benefits resulting from waterborne transportation, including lower energy consumption than rail, and minimal atmospheric emission, are noted. Impacts on water quality of spills, discharges, and floatation of vessels are minimized. A number of institutional changes brighten the complex's economic future. These include a reexamination of water and rail freight rates to bring about a more equitable distribution of traffic, and extension of the navigation season, and development of new facilities and vehicles. PROPOSED NATURAL AREAS, SALT RIVER SALT BANKS, REPORT NO 2,
Arizona Academy of Science, Tempe.
E. L. Smith, and G. L. Bender.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-225 218, $3.25 in paper copy, $2.25 in microfiche. Arizona Office of Economic Planning and Development, Phoenix, Report OEPAD-EP-73-2, June 1973. 10 p.

Descriptors: *Natural resources, *Arizona, *Conservation, Preservation, Land management, Land classification.
Identifiers: *Salt River Salt Banks(Ariz).

Arizona's Academy of Science has recommended the establishment of the Salt River Salt Banks as a Scientific Natural Area (NA). The banks are on the Fort Apache Indian Reservation on the north shore of the Salt River. The area of salt deposition is nearly one mile in length, 100 feet in width, and between 50-75 feet above the river bed. Three nearby springs flowing over the bank form stalactites. Formerly existing springs may have been the source of the depositions. Climate of the area is typical of southern Arizona desert areas. Terrestrial fauna likely to be encountered are representative of lower Sonoran desert areas. Rare and endangered species of native fish including the Colorado River squawfish, loach minow, and humpback sucker are also found in the area. Past disturbances have been minimal. Presently a camping area and jeep trail have been located near the salt bank. The level of utilization of these facilities is yet unknown. The unique geology of the salt bank plus the character of the Salt River, a wild free-flowing river, are important reasons to establish the site as a scientific NA. Its inaccessibility prohibits its usefulness as an educational NA. (Schroeder-Wisconsin)
W75-03396

ALTERNATIVES IN AQUACULTURAL DEVELOPMENT: CONSIDERATION OF EXTENSIVE VERSUS INTENSIVE METHODS,
National Marine Fisheries Service, Galveston, Tex. Biological Lab.
R. A. Neal.
Journal Fisheries Research Board of Canada, Vol 30, No 12, Pt 2, p 2218-2222, 1973.

Descriptors: *Economic impact, *Fish management, Social impact, Political aspects, Fisheries, *Aquiculture.
Identifiers: Extensive culture, Intensive culture.

Legal, biological, economic, environmental, and social aspects arising from the development of extensive versus intensive aquaculture practices are surveyed. Extensive practices raise fish or shellfish in natural settings with little environmental modification; intensive practices involve sizable environmental manipulation. Extensive practices face sizable legal problems though their use of public land; the need to restrict passage through navigable waters to restrain aquatic species; and their inability to claim legal ownership of stocked species placed in natural water bodies. Biologically, the benefits from each practice depend on the species, feeding habits, behavior, and environmental requirements. Herbivorous filter feeders which utilize a wide range of plants are best raised through extensive methods. Four economic aspects, facility cost, competing uses of the natural waters, operational costs, and dependability, were also examined. Initial facility costs are generally higher for intensive practices, while indirect costs to other water resource users are higher for extensive culture practices. Extensive culture systems are notably more subject to losses due to environmental changes. Both practices are subject to externalities arising from the use of a common property. Under present conditions, for most carnivorous and omnivorous species of interest to aquaculturalists, expenditures for extensive practices are not found justified. (Schroeder-Wisconsin)
W75-03398

TACNA MARSH. NATURAL AREA REPORT NO. 35,
Arizona Academy of Science, Tempe.
E. L. Smith, and G. L. Bender.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-225 249, $3.25 in paper copy, $2.25 in microfiche. Report No OEPAD-EP-73-35, June 1973. 11 p, 1 fig. HUD CPA-AZ-09-16-1008.

Descriptors: *Conservation, *Freshwater marshes, *Arizona, Natural resources, Land management, Preservation, Land classification, *Marsh management, Wildlife management.
Identifiers: Gila River(Ariz), *Tacna Marsh(Ariz), Educational natural area, Recreational natural area.

Tacna Marsh on the Gila River in Yuma County, Arizona is recommended as an educational or recreational natural area. The marsh contains the largest water bodies along the lower Gila River. One area of open water, five acres in size and about two feet deep, is surrounded by cattails, arrowweed, and salt cedar. A second area of more than ten acres, located immediately upstream from the first, has brush scattered throughout the pond. Both ponds provide water for wildlife and vegetation, but each benefits different species. Also, several species now known to nest in either pond are rarely found elsewhere in the state. Channelization, irrigation, and reservoir projects in the area have had varying impacts on the marsh's ecological state. Rising water tables, increased salinity, and uprooted trees are among the physical changes resulting from increasing activities in the region. Establishment of the marsh as a natural area would benefit students and bird watchers in addition to maintaining the habitat of nesting birds rarely found outside of the marsh. (Schroeder-Wisconsin)

Identifiers: *Coastal zone management, *Coastal waters.

Some of the problems facing the nation's shorelines and their present and future effect upon the marine trades are examined. Despite the growing demand for marine recreation activities, the marine trades are hampered by the present system of land distribution and the frequently fragmented and disjointed efforts of government to improve conditions in the coastal zones. The present system for distributing coastal lands among the various competing uses breaks down both in the marketplace and in the political arena. Recreational uses are at a competitive disadvantage in a market that distributes the limited supply of a coastal lands to those most able and willing to pay for it. The political system fails to identify and protect the interests of the public due to parochialism within government and apathy on the part of the public. Only through a united effort of the many independent marine trades pressuring government for a comprehensive coastal management program will the interests of the industry, and of the public, be effectively protected. Identifiers: Audit, Rules, Bargaining, Intention, Plan formulation, Democracy, Comprehensiveness, Planning organization, Planning procedure, Needs, Goals, Policy, Alternatives, Clarity, Mediator, Problems approach, Public interest, Experiment, Inquiry, Sensors, Pathors.

Planning is a political process. It is grounded in bargaining and self-education (inquiry). It must be democratic. Planning audit pushes beyond criticism and evaluation, concentrating instead on repairing whatever may have gone amiss. Here is a theory for systematic planning audit. The framework of sensor and pathor questions provides the basic auditing tool. It is designed to stimulate rethinking of sustaining philosophies and accepted procedures, and to identify specific pathologies. A two-pronged approach is recommended--with auditors from inside the planning process enlisting outside help. Test-out of this system indicates need for far-reaching reform of planning theory and methodology. Major changes are urged: (1) a new direct democracy of citizen participation based on transparency of the planning process; (2) a top-down, pragmatic, problem-centered approach emphasizing general systems theory and displacing the goal-centered approach; (3) diverting effort away from devising make-believe alternatives and into developing policies for simple acceptance or rejection at higher levels; (4) using Rules of Release (listed here)--counterpart to Rules of Order (Robert's)--for administrative bargaining situations, rules designed to combat secrecy, conformance, and horsetrading, and to promote creativity. Major objective: to improve river basin planning. Basic understandings, applications and illustrations are drawn from water resources planning experience.

The relationship between scale values of magnitude obtained from category and successive-intervals scaling procedures is expected to be nonlinear in many cases. This research presents the hypothesis that the relationship will be linear if discriminal dispersions are constant and specifiably concave if these dispersions systematically increase or decrease with magnitude. The data represent the case of constant discriminal dispersions and the prediction for this condition are supported. (Snyder-California,Davis)

HOW DO YOU EXPLAIN THE COST,
LFE Control System Industries, Santa Clara, Calif.
D. G. Ridgeway.
Water and Wastes Engineering, Vol 11, No 2, p 49-50, 60, 1974. 2 fig, 2 tab.

Descriptors: *Public utilities, *Automatic control, *Control systems, Water works, Data collections, *Costs, Digital computers, Automation, Capital costs, *Treatment facilities, Operating costs.

Savings from installation of an automated control system (DIGIDAC--digital data acquisition and control) in a water or waste water system are explored. Only a small number of DIGIDAC systems have been installed making cost performance data scarce. The overall approach to cost justification comes from LFE/CSI's computer system experience, extensive review of water/waste industry literature, and comments by senior systems engineers at the American Water Works Service Company. Several benefits are noted. Estimates indicate that an effective management information system should improve overall management by two to five percent. Cost savings include: (1) capital development cost savings resulting from reduction of over- or under-design of capital facilities, (2) chemical cost savings by the elimination of measurement errors, (3) power savings, and (4) economic dispatch savings. Some labor savings are also noted. Use of the automatic control system is also valuable in providing data on the need for rate increases, thereby reducing much of the subjectivity involved in that decision. (Schroeder-Wisconsin)

FINANCING RESOURCES FOR FISHERY DEVELOPMENT,
Inter-American Development Bank, Washington, D.C.
J. Luna-Munoz.
Journal Fisheries Research Board of Canada, Vol 30, No 12, Pt 2, p 2059-2064, 1973.

Descriptors: *Fish management, Fishing, Fish harvest, Commercial fishing, Financing.
Identifiers: *Fisheries financing, *Fishery development, Developing countries.

The sources of, needs for, problems related to, and analysis undertaken in the provision of financial arrangements for fishery development are outlined. In general, three types of development projects are considered: (1) specific projects related to a particular fishery area and independent of areas; (2) integrated projects involving almost all areas in the fishery sector; and (3) integrated projects which attempt to aid fishery development as part of the integrated economy. Each of the general forms have differing financial requirements and differing available financial sources. Failures or difficulties in financial arrangements for each may be attributed to lack of data about the resource or the recipient, inadequacy of the infrastructure or supportive services, low technical management or skills, and lack of marketing or distribution systems. Funding sources continue to supply money, however. Major contributors include local resources from the private sector, national resources, private foreign investment or credit by equipment suppliers, and resources from bilateral or multilateral agreements. Financing of fishery development is generally undertaken following an attempted thorough analysis. Three steps are involved in the multilateral analysis: pre-investment data collection and project designing; technical, financial, economic, institutional, and legal analysis of alternative project designs; and execution and feedback of information. 1971 SALMON RIVER ESTUARY RESOURCE USE STUDY,
Oregon Fish Commission, Salem. Div. of Management and Research.
T. Gaumer, D. Demory, and L. Osis.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74-10345, $3.25 in paper copy, $2.25 in microfiche. Report November 1973. 24 p, 6 fig, 16 tab. NO4-3-208-55, NOAA N208-0073-72(N), DACW 57-72-C-0138.

Descriptors: *Estuaries, *Recreation, *Oregon, Fish management, Fishing, Sculpins, Crabs, Shrimp, *Fisheries.
Identifiers: *Resource use, Tideflat, *Salmon River Estuary(Ore).

In March-October, 1971 the Oregon Fish Commission conducted a comprehensive study of marine food fish, shellfish, and miscellaneous invertebrates within the Salmon River Estuary. The estuary, located 119 miles south of the Columbia River, consists of a 204 acre bay with 126 acres of tideland. During the study, 285 boat, shore, tideflat, and scuba resource users were interviewed to aid in the construction of a series of marine resource maps. These maps illustrate principal boat fishing areas, clambeds, eel grass beds, food production areas, fish feeding areas, and fish migration routes. Recreation user data compiled

indicates that 3,000 user trips (800 boat, 2,100 shore, and 100 tideflat) harvested 4,500 animals (1,900 fish, 1,700 shrimp, and 900 crabs) in the estuary during the study period. Dungeness crabs comprise 54% of the boat anglers' catch and finfish, primarily Pacific staghorn sculpin, was the major catch of the shore anglers. Shrimp was the only species harvested by the tideflat users. No commercial fisheries exist in the estuary. (Schroeder-Wisconsin)

1971 SAND LAKE ESTUARY RESOURCE USE STUDY,
Oregon Fish Commission, Salem. Div. of Management and Research.
T. Gaumer, D. Demory, and L. Osis.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74-10341, $3.25 in paper copy, $2.25 in microfiche. Report November 1973. 24 p, 6 fig, 16 tab.

Descriptors: *Estuaries, *Oregon, Fish management, *Fisheries, Eels, Clams, Crabs, Invertebrates, Mapping.
Identifiers: *Resource use, *Marine resource map, *Sand Lake Estuary(Ore).

In March-October 1971, the Oregon Fish Commission conducted a comprehensive study of marine food fish, shellfish, and miscellaneous invertebrates (with the exception of anadromous species resources) in the Sand Lake Estuary. The 528-acre estuary, located 90 miles south of the Columbia River, contains 397 acres of tidelands. During the study 938 boat, shore, tideflat, and scuba resource users were interviewed to aid in the construction of a series of marine resource maps illustrating principal boat fishing areas, clam beds, eel grass beds, food production areas, fish feeding areas, and fish migration routes. Recreation data compiled indicates that 9,800 resource user trips (200 boat, 6,000 shore, and 3,600 tideflat) harvested 94,900 marine animals (88,500 shrimp, 5,800 fish, 500 crabs, and 100 miscellaneous invertebrates) in the estuary during the study period. Dungeness crabs and starry flounders were the only identifiable species caught by boat anglers, while the pacific staghorn sculpin and starry flounders were the principal fish species caught by shore anglers. Ghost and mud shrimp comprised 93% of the tideflat users harvest. Tideflat users harvested 94% of the total number of animals taken from the estuary. (Schroeder-Wisconsin)

1971 ALSEA RIVER ESTUARY RESOURCE USE STUDY,
Oregon Fish Commission, Salem. Div. of Management and Research.
T. Gaumer, D. Demory, and L. Osis.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74-10339, $3.75 in paper copy, $2.25 in microfiche. Report November 1973. 28 p, 6 fig, 16 tab. DACW 57-72-C-0138, NOAA N208-0073-72(N), NO4-30-208-55.

Descriptors: *Estuaries, *Oregon, Fish management, *Fisheries, Crabs, Shrimp, Clams, Eels, Mapping, Invertebrates.
Identifiers: *Marine resource map, Resource management, *Alsea River(Ore).

In March - October 1971, the Oregon Fish Commission conducted a comprehensive study of marine food fish, shellfish, and miscellaneous invertebrates, with the exception of anadromous species, in the Alsea River Estuary. The estuary, located 167 miles south of the Columbia River, consists of a 2,146 acre bay with 979 acres of tideland. During the study 3,401 boat, shore, and tideflat resource users were interviewed to assist in the design of a series of marine resource maps. These maps illustrate the principal boat fishing areas, clambeds, eel grass beds, food production areas, fish feeding areas, fish migration routes, and known herring spawning areas. Recreational data compiled indicates that 27,500 resource user trips (13,900 boat, 10,000 shore, and 3,600 tideflat) harvested 134,500 animals (55,900 shrimp, 31,400 fish, 23,600 crabs, 23,400 clams, and 200 miscellaneous invertebrates) in the estuary during the study period. Dungeness crabs comprised the majority of the boat anglers' catch; Pacific staghorn sculpin, starry flounder, and shiner perch the principal shore anglers' catch. Ghost shrimp and cockle and softshell clams were the primary catch of tideflat users. Commercial shellfish landings also accumulated 10,791 pounds valued at $8,000. (Schroeder-Wisconsin)

EXPANSION AND EVALUATION OF AN ARTIFICIAL REEF OFF MURRELL'S INLET, SOUTH CAROLINA,
National Marine Fisheries Service, Beaufort, N.C. Atlantic Estuarine Fisheries Center.
R. B. Stone, C. C. Buchanan, and R. O. Parker.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-73-10395, $4.25 in paper copy, $2.25 in microfiche. Report CPRC-72009, February 1973. 2 fig, 16 tab, 17 ref. 10140032.

Descriptors: *Fish management, *Fishing, Fish establishment, *South Carolina, Recreation, Reefs.
Identifiers: *Artificial reef, Paradise Reef(SC), Murrell's Inlet(SC).

In the spring of 1971, local businessmen, the National Marine Fisheries Service, and the South Carolina Marine Resources Division engaged in a cooperative effort to expand and study the Paradise Fishing Reef. The expansion phase of the project consisted of assembling and adding over 20,000 scrap tires to the reefsite. A number of studies were conducted to determine the effect of the artificial reef on the distribution and abundance of fish. Migration habits of reef fish were traced through tagging. Fishing was surveyed by counting private boats leaving the inlet during selected periods, while angler success was surveyed through mail questionnaires. Results indicate the artificial reef has provided a favorable fish habitat. One of the experimental reefs increased fish-carrying capacity 300-1800 times over the prior open bottom. The ten-tire compressed bale proved to be the easiest unit to use in expanding the reef. Catch per angler hour for pelagic fish was higher over the reef but not statistically different from the natural habitat. The reef attracted a number of new anglers (16%) to the area, but future expansion is necessary to accommodate the fishing pressure it receives. (Schroeder-Wisconsin)

COMMERCIAL OYSTER FISHERY DEVELOPMENT INVESTIGATION,
Hawaii State Dept. of Land and Natural Resources, Honolulu.
P. Y. Kawamoto, and H. M. Sakuda.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-73-11754, $3.75 in paper copy, $2.25 in microfiche. Report No NOAA-73090614, May 1973. 37 p, 14 fig, 3 tab, 16 ref. H-2-R and H-13-R.

Descriptors: *Oysters, *Shellfish farming, Aquiculture, *Hawaii, Fish management, *Commercial shellfish, Biological properties, *Feasibility studies.
Identifiers: West Loch(Hawaii), *Pearl Harbor(Hawaii), Oahu(Hawaii), Crassostrea virginica.

Biological factors and aquicultural practices were examined over the 1963-1972 period to determine the feasibility of developing a Hawaiian commercial oyster industry utilizing the American oyster, Crassostrea virginica. American oysters used in this study came from West Loch in Pearl Harbor. Bed samplings were conducted for gonad development. Routine hydrographic and bacteriological observations were also made at study sites. Experimental oysters were also studied in various fish-ponds and tidal areas to determine their viability as growing areas. Results indicate that West Loch oysters reach maturity in two months. Spawning occurs primarily from March through October and 15 months is required to attain commercial sizes. The annual mortality rate was estimated at 68.7%. Oysters from West Loch reached commercially acceptable quality in 3 weeks utilizing artificial feeding conditions. Studies of the impact of thermal pollution on oysters indicate that growth is slower in warm water than in the cooler intake water. A serious problem faced by existing West Loch beds was a drastic depletion of the stock due to undetermined causes in 1972 which may require restocking from other areas. (Schroeder-Wisconsin)

THE TRANSITION FROM SMALL-SCALE TO LARGE-SCALE INDUSTRY,
United Nations Development Program, Lagos (Nigeria).
C. Campleman.
Journal Fisheries Research Board of Canada, Vol 30, No 12, Pt 2, p 2159-2165, 1973.

Descriptors: *Fisheries, *Fish management, Regional development, Water resources development, *Economic feasibility, Benefits, Planning.
Identifiers: *Developing countries, *Fishing industry.

Because general economic growth lags behind improved food production efficiency, developing countries have great incentives to push for large scale fisheries. Improving the artisanal fisheries productivity is complex, involving improvement of technology, marketing, education, and communications. Provision of the institutions, the infrastructure, capital assistance, and extension of the fishery is also necessary. While these measures can greatly improve the artisanal fishery's production, they cannot turn it into a large-scale industry in a short period of time. Instead, developing countries have attempted to create a modern capital-intensive firm co-existing with the artisanal sector. The new sector benefits the old through expansion of the markets, technical adoption, and improvements of the intrastructure. Such benefits are limited, however, unless the new sector exploits new fishery resources. Principal constraints to the new sector are similar to those limiting development of the old: lack of capital; lack of foreign exchange; lack of managerial and technological skills; and lack of an adequate infrastructure. Several forms of governmental intervention including multilateral and bilateral agreements, joint ventures, and managerial contracts are suggested as means to eliminate the above constraints. THE ROLE OF AQUACULTURE IN FISHERY DEVELOPMENT AND MANAGEMENT,
Food and Agriculture Organization of the United Nations, Rome (Italy). Dept. of Fisheries.
T. V. R. Pillay.

Journal Fisheries Research Board of Canada, Vol 30, No 12, Pt 2, p 2202-2217, 1973. 11 tab, 18 ref.

Descriptors: *Aquiculture, *Fish management, *Mollusks, Cost-benefit analysis, Fish farming, Foods, Regional development, Natural resources, Water resources development, Return(Monetary).
Identifiers: Fishery conservation.

Although aquaculture has had differing developmental patterns throughout the world, it presently represents a viable and growing industry. With world production difficult to assess, FAO statistics indicate that 36 countries produced by culture over three million tons of finfish and one million tons of mollusks in 1970. In the U.S. alone, $80 million of ornamental fish are imported annually. Presently, aquaculture is used for food production; improvements of natural stocks; production of sportsfish, baitfish, and ornamental fish; fertilizers; and feeds. It also provides a number of jobs, and assists in the improvement of fishery management practices by lessening the strain on the wild stocks through the development of new supply sources. With seed, feed, and labor representing major costs, a summary of a number of cost-benefit studies of several commercial aquaculture firms indicates that government subsidies are not necessary for their development. Although no world-wide survey has been conducted, it is known that extensive areas are readily available for aquaculture in many developing countries. Constraints limiting further aquaculture development are lack of adequate planning, financing, and shortage of trained personnel. (Schroeder-Wisconsin)

MERCURY,
Bureau of Mines, Washington, D.C. Div. of Nonferrous Metals.
V. A. Cammarota, Jr.
Available from Superintendent of Documents, Washington, DC 20402, for $0.25 per copy. In: 1972 Bureau of Mines Minerals Yearbook, US Government Printing Office, Washington, DC, 1972, 11 p. 1 fig, 13 tab, 18 ref.

Descriptors: *Mercury, *Legislation, Regulation, *Toxicity, Water pollution, Federal Water Pollution Control Act, Pollutants, Mining, Heavy metals, Organic compounds, Inorganic compounds, Public health, Industrial wastes, Water pollution sources.

A general overview of mercury covers the areas of legislation and government programs, domestic production, consumption and uses, prices, foreign trade, a world review of mercury, and recent technology. Because of restrictions on the use of mercury in certain industrial processes imposed by the EPA, sales and prices of mercury dropped to a new low in 1972, and many mines were closed or partially closed. However, consumption in 1972 was 1% higher than in 1971. Increased consumption was noted for agriculture, dental preparations, and industrial and control instruments. Electrical apparatus, down 8%, showed the largest decline of the major uses, mainly because of a fall in consumption for batteries. Mercury exports decreased significantly to 400 flasks from 7232 flasks in 1971. Because of the concern over the level of mercury in the environment, available data on mercury content in rocks, ores, minerals, soil, water and plants were compiled with a view toward elucidating the role of natural processes in releasing mercury to the environment. A process was developed to remove mercury from the sulfuric acid produced from roasting zinc ores, and a method of determining traces of mercury in liquids, sensitive to about 1 part per billion, was developed. A NOTE ON THE EVALUATION OF ACTIVITY DEPENDENT RECREATIONAL DAMAGE COST FUNCTIONS,
Texas Univ., Austin. Dept. of Chemical Engineering.
M. Bundgaard-Nielsen, and D. M. Himmelblau.
Water Resources Bulletin, Vol 10, No 3, p 580-585, 1974. 2 fig, 5 ref.

Descriptors: Recreation, *Water resources development, *Recreation demand, Water quality, Planning, *Costs, *Evaluation, *Benefits.

Determination of recreation benefits arising from improved water quality is an important aspect of water resources management. To develop the functional relationship three steps must be undertaken: identify the form of the function; estimate the coefficients of the functions through nonlinear estimation; and validate the function. Several approaches to developing recreational functions for water quality have been utilized. In the first, using attitude surveys, recreationists' perceptions of water quality are surveyed. Information from such surveys is generally difficult to relate to quantitative water quality factors, although they do isolate quality characteristics important to the public. A second postulates demand over supply functions for water quality, but difficulties in functional form and data generally limit such studies to qualitative interests. A third approach classifies benefits from water quality arising from water based activities requiring certain minimum water quality, but independent otherwise, and water based activities which rise proportionately to improved quality. Such an approach envisions a family of recreation functions. Estimation of coefficients under this approach can be facilitated through factual information on the physical characteristics of the water system combined with socio-economic investigations and/or subjective assessments of the specific recreation activity's value to yield a quantitative functional form. ELECTRIC ENERGY REQUIREMENTS FOR ENVIRONMENTAL PROTECTION,
Oak Ridge National Lab., Tenn.
E. Hirst, and T. Healy.
Available from the National Technical Information Service, Springfield, Va. 22161, as CONF-730205-4, $4.00 in paper copy, $2.25 in microfiche. Presented at the Conference on Energy: Demand, Conservation and Institutional Problems, Massachusetts Institute of Technology, Cambridge, February 12-14, 1973. 20 p, 1 fig, 4 tab, 36 ref.

Descriptors: *Electric power demand, *Environmental effects, Conservation, Environmental engineering, Waste water treatment, *Pollution abatement, *Energy, Electric power production.
Identifiers: Electric mass transit, Solid waste disposal, Air pollution control, Waste heat dissipation, Electricity conservation.

Potential energy savings or expenditures resulting from six environmental quality strategies--electric mass transit, waste water treatment, solid waste disposal, air pollution control, waste heat dissipation, and electricity conservation--are summarized. Increased utilization of urban electric mass transit to 10% of the 1970 urban auto traffic; primary-secondary treatment of all 1970 waste water; 100% of incineration of 1970 solid waste (collection, transportation, and land filling having little electricity consumption); air pollution controls utilizing electrostatic precipitators and limestone scrubbers; and waste heat dissipation using cooling towers at power stations would result in increased energy consumption of 21, 25, 5, 39, and 14 billion KW hr/year respectively. Two strategies to handle solid waste are examined as methods to reduce total electricity consumption and adverse environmental effects of power production. Incineration to generate electricity or recycling of solid wastes could have reduced energy consumption in 1970 by 25 and 23 billion KW hr/year. Shifts in home heating to gas, increased insulation, and utilization of more energy-efficient air conditioners could also have reduced energy consumption by 60 billion KW hr/year. Energy costs of construction of such systems are not discussed. (Schroeder-Wisconsin)

EAST BRIMFIELD AND WESTVILLE RESERVOIRS. QUANTITY AND VALUE OF WATER SUPPLY STORAGE. QUINEBAUG RIVER--MASSACHUSETTS.
Public Health Service, New York.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-778 564, $3.75 in paper copy, $2.25 in microfiche. July 1959. 23 p, 4 tab, 1 fig.

Descriptors: *Water sources, *Water resources, *Water supply, *Water demand, *Massachusetts, Storage, Water storage, Reclaimed water, Water reuse, Resources, Water quality, Watershed management, *Management, Water utilization, Water yield, Water yield improvement, Supply, Water policy, Resources development, Watersheds(Basins), Potential water supply, Electric power, Electric power demand, Utilities, Reservoirs.
Identifiers: *Quinebaug River(Mass), *Southbridge(Mass), *Hatchet Brook watershed(Mass), *East Brimfield Dam(Mass), Westville Dam(Mass).

Two major water sources available to Southbridge, Massachusetts, are the Hatchet Brook watershed which furnishes 1.3 MGD and the Quinebaug River which provides 9.8 MGD of reclaimed industrial water. The Southbridge Water Supply Company will need additional water since future demand exceeds the safe yield of the existing system. These requirements probably can be best served by developing the Breakneck Brook watershed rather than from storage on the Quinebaug River. However, Southbridge's major industrial water users depend on water from that river and require storage. The value of supplying a minimum flow in the Quinebaug River of 22 cfs from the East Brimfield Dam and Reservoir was investigated in terms of costs of alternate single-purpose water supply reservoirs and the cost of electric power that may be purchased to substitute

for power generated in existing steam plants. The latter method of evaluation gave the lowest reasonable value for the assured flow. Cost of substituting electric power in maintaining a minimum flow of 22 cfs in the Quinebaug River is $7,400 per year. The present worth of $7,400 annually for 50 years at 4 per cent interest is $159,000. (Grden-North Carolina)

STUDY AND SURVEY OF LAKE MICHIGAN SHORE LINE,
Smith and Hurd Annotated, Ch 19, secs 1141-1146, p 35-36 (Supp 1973). (Illinois).

Descriptors: *Erosion control, *Lake Michigan, *Illinois, *Administrative agencies, *Coordination, *Public health, Safety, Federal government, Local governments, Adoption of practices, Administration, Economic aspects, Research, Shoreline, Inter-agency cooperation, Water resources development, Evaluation, Land management, Water management(Applied), Surface runoff, Erosion.
Identifiers: Administrative regulations, Environmental policy, State policy.

The Illinois Division of Water Resource Management of the Department of Transportation in coordination with federal and local agencies will study and devise means of preventing erosion of the shore of Lake Michigan. An attempt will be made to prevent or minimize, in the immediate future, damage to homes and other buildings and danger to human life resulting from such erosion. Agreements between cooperating agencies, organizations, and individuals may be made to assign specific projects, phases of particular projects, as well as joint undertakings and contributions of funds. The Division of Water Resource Management will work with the federal government to evaluate the influence of the construction at the Great Lakes Naval Training Facility upon the southerly movement of littoral material along the west shore of Lake Michigan. No contract may be entered into for any expenditure of funds appropriated and made available to implement and carry out this legislation without the prior written approval of the Governor. (Sperling-Florida)

UNITED STATES V. CHESAPEAKE AND DELAWARE SHIPYARD, INC. (SUIT BY GOVERNMENT TO RECOVER UNDER THE 'WRECK ACT').
369 F Supp 714 (DC Md 1974).

Descriptors: *Maryland, *Judicial decisions, *Rivers and Harbors Act, *Neglience, *Navigable waters, Legal aspects, Water law, Legislation, Navigation, Canals, Channels, Inland waterways, Non-consumptive use, Water policy, Federal government, Common law, Law enforcement, Non-structural alternatives, Damages, Administrative agencies, Administration, Adjudication procedure.
Identifiers: Navigation obstructions, Presumptions(Legal).

The United States, pursuant to section 409 of the Rivers and Harbors Act, the 'Wreck Act' sued the defendant corporation to recover costs incurred in raising and removing the defendant's barge from a navigable channel of the Chesapeake and Delaware Canal. The barge had been intentionally sunk and moored by employees of the defendant. One evening the barge inexplicably broke its moorings and settled in the channel. When asked to remove the barge, the defendant's president refused, stating that it was abandoning the barge. The Corps of Engineers subsequently removed the barge. The government asserted that the sunken barge was a 'vessel' under the Wreck Act and that under the doctrine of res ipsa loquitur the defendant was held negligent and therefore liable under the Act. The U.S. District Court of Maryland sustained the government and held that the defendant failed to overcome the inference of negligence under res ipsa loquitur. The court ruled that where a vessel sinks in a navigable waterway due to owner's negligence, thereby creating an obstruction to navigation, the owner may not shift the burden of removing the vessel to the government by abandoning the vessel. Judgment was for the government. (Deckert-Florida)

SCHINE ENTERPRISES, INC. V. ASKEW (DECLARATORY JUDGMENT ACTION CONCERNING FLORIDA INLAND NAVIGATION DISTRICT).
291 So 2d 130 (1st D C A Fla 1974).

Descriptors: *Florida, *Judicial decisions, *Contract administration, *Legislation, *Claims(Contracts), Legal aspects, Water law, Legal review, Equity, State jurisdiction, State governments, Administrative agencies, Water resources development, Constitutional law, Water policy, Comprehensive planning, Inland waterways, Conservation, Recreation, Area redevelopment, Land tenure, Contracts, Land development, Land management.
Identifiers: Declaratory judgments, State policy, Coastal waters, *Coastal zone management.

Plaintiff corporation sought a declaratory judgment as to its rights under a contract which its predecessor had entered into with the Florida Inland Navigation District, a state agency. The contract concerned a parcel of property through which the Intercoastal Waterway ran. The contract was an option agreement giving the plaintiff the right to 'meet and match' any satisfactory purchase offers respecting the property. The plaintiff contended that a dedication of the land to another state agency, made pursuant to a state statute directing development of the property for recreation and conservation purposes, violated the agreement and that the authorizing statute deprived it of property without due process of law. The trial court ruled in favor of the defendants, and the plaintiff appealed. The District Court of Appeal of Florida, affirming the lower court, ruled that the plaintiff's contract right was in the nature of a 'right of first refusal' contingent upon receipt by the District of a satisfactory offer to purchase from a third party. It further held that the dedication agreement was not a transfer within the meaning of the contract, and thus the plaintiff's contractual rights were not impaired. (Deckert-Florida)

CANAL AUTHORITY OF STATE OF FLORIDA V. CALLAWAY (INJUNCTION TO STOP CONSTRUCTION).
489 F 2d 567 (5th Cir Fla 1974).

Descriptors: *Florida, *Judicial decisions, *Environmental effects, *Canal construction, *Inland waterways, Federal government, State governments, Federal jurisdiction, Water management(Applied), Legal aspects, Governmental interrelations, Political aspects, Water law, Flooding, Federal-state water rights conflicts, Ecology, Impoundments, Lakes, Multi-purpose reservoirs, Legal review, Administration, Rivers, Post-impoundment, Administrative decisions, Recreation, Adjudication procedure, Administrative agencies.
Identifiers: Injunctive relief, Presumptions(Legal), Dam effects, National Environmental Policy Act.

The plaintiffs, a state canal authority and others, sought an injunction against several federal agencies to prevent the termination of the Cross Florida Barge Canal project, and also requested a preliminary injunction preventing the proposed drawdown of Lake Ocklawaha which had been created as part of the canal project. The plaintiffs contended that the drawdown would result in the loss of recreational use of the lake, loss of tourism, and alteration of the lake ecology. The defendants argued that creation of the lake had already damaged the original tree swamp ecology of the Ocklawaha Valley and that continued maintenance of the lake would result in the permanent destruction of the Ocklawaha Valley. A federal district court in Florida granted the injunction. When subsequent attempts to have the injunction lifted failed, and defendants appealed. The Fifth Circuit Court of Appeals held that the district court erred in placing the burden on the defendants to prove that their interests would suffer irreparable harm if the preliminary injunction was granted. The appellate court ruled that the burden of persuasion was at all times upon the plaintiffs and instructed the lower court to re-examine its order under the proper standards and without delay. ENVIRONMENTAL DEFENSE FUND, INC. V. CORPS OF ENGINEERS OF THE UNITED STATES ARMY (ACTION TO RESTRAIN CORPS FROM FURTHER CONSTRUCTION OF NAVIGATION PROJECT).
492 F 2d 1123 (5th Cir 1974).

Descriptors: *Judicial decisions, *Federal jurisdiction, *Environmental effects, *Inland waterways, *Canal construction, Canals, Mississippi, Tennessee, Alabama, Water management(Applied), Ecology, Federal government, Administrative agencies, Federal project policy, Project planning, Engineering structures, Legal aspects, Water law, Legal review, Navigation, Rivers, Navigable waters, Administrative decisions, Project benefits, Project purposes, Adjudication procedures.
Identifiers: Injunctive relief, *Environmental impact statement, National Environmental Policy Act, Private interest groups.

Certain individuals and environmental groups sought an injunction against the Army Corps of Engineers and others to halt construction of the Tennessee-Tombigbee Waterway. The project was authorized prior to passage of the National Environmental Policy Act of 1969. Work on the project was halted by a preliminary injunction issued in 1971 by the federal district court for the District of Columbia, and the action was transferred to a federal district court in Mississippi. That court dismissed the complaint and dissolved the preliminary injunction. Construction has been underway since that dissolution. The plaintiffs contended that the Corps had failed to adequately consider environmental factors in its planning decisions and thus had not complied with the requirements of the NEPA. On appeal from the dismissal, the Fifth Circuit Court of Appeals ruled that an environmental impact statement prepared by the Corps complied with the NEPA requirements, and affirmed the lower courts ruling. The court further held that, although it had authority to review substantive agency decisions concerning environmentally controversial projects, Congress itself, by appropriating funds for this project after consideration of its environmental impact, had supplanted the Corps' decision and had thereby precluded such review. (Dekert-Florida)

ENVIRONMENTAL DEFENSE FUND V. TENNESSEE VALLEY AUTHORITY (ACTION TO ENJOIN TVA FROM COMPLETING CONSTRUCTION OF TELLICO DAM).
492 F 2d 466 (6th Cir 1973).

Descriptors: *Tennessee, *Judicial decisions, *Environmental effects, *Tennessee Valley Authority, *Adjudication procedure, Multiple-purpose projects, Rivers, Federal jurisdiction, Legal aspects, Legislation, Law enforcement, Dam construction, Impoundments, Flooding, Water management(Applied), Water law, Legal review, River basin development, Water supply, Watershed management, Multiple-purpose reservoirs, Federal government, Flood control, Recreation, Hydroelectric power.
Identifiers: Dam effects, *Environmental impact statement, Injunctive relief, National Environmental Policy Act, FWPCA Amendments of 1972, Environmental policy, Private interest groups.

An appeal was made from a Federal District Court decision dissolving a preliminary injunction and granting judgment for the defendant. The plaintiff environmental group sought to enjoin the defendant federal agency from completing construction of the Tellico Dam Project. This sixty-nine million dollar project admittedly would entail considerable ecological damage. The lower court granted a preliminary injunction on the finding that the defendant had not complied with the National Environmental Policy Act by filing an adequate impact statement. This preliminary injunction was upheld on appeal. After a hearing on the merits and consideration of the final impact statement, the district court dissolved the injunction and rejected the contention that the project was in violation of the N.E.P.A., or any other federal laws. The Sixth Circuit Court of Appeals affirmed, and held that the district court correctly applied the proper balancing test between ecological damage and economic and social benefits. The court also held that the N.E.P.A. did not require perfection, and that in assessing the adequacy of impact statements, practicability and reasonableness are to be considered along with the broad purpose of the Act. THE INFLUENCE OF RECENT TRENDS IN WATER LEGISLATION ON THE STRUCTURE AND FUNCTIONS OF WATER ADMINISTRATION,
Fordham Univ., Bronx, N.Y. School of Law.
L. A. Teclaff.
Land and Water Law Review, Vol 9, No 1, p 1-19, 1974. 77 ref.

Descriptors: *River basin commissions, *River basin development, *Interstate commissions, *Comprehensive planning, *Water resources development, Governments, Water supply development, Water policy, Water law, Legislation, Local governments, Water pollution, Water pollution control, Water supply, Federal government, Water utilization, Water conservation, Water quality control, Adoption of practices.
Identifiers: *International agreements, Water rights(Non-riparians), Administrative regulations.

Common trends are developing internationally in water legislation. The common increasing demand for water means common problems of regulation. From conferences such as the International Conference on Water for Peace, 1968, a large body of data on water law and administration has become available. The common trends are most clearly manifest in the legalizing of the river basin as the basis for cooperation between states. International commissions of the Nile, Indus, and La Plata have authority only to advise and supervise the execution of previously approved water works. These commissions are more influential upon national water development than upon international cooperation. Both the Niger treaty and the 1972 Ramsar convention were concerned with detrimental effects of water development on other elements of the environment. On a world-wide scale, consolidation of water administration, preferably independent of existing agencies, is taking place very slowly. Recent water law tends to extend administrative control over all water uses. The goal is to co-ordinate the water control activities of a series of river basin agencies under one national water control agency. (Dillingham-Florida)

THE NECESSITY OF ZONING VARIANCE OR AMENDMENTS NOTICE TO THE WISCONSIN DEPARTMENT OF NATURAL RESOURCES UNDER THE SHORELAND ZONING AND NAVIGABLE WATERS PROTECTION ACT,
McBurney, Musolf and Whipple, Madison, Wis.
C. H. Whipple.
Marquette Law Review, Vol 57, p 25-38, 1973. 85 ref.

Descriptors: *Wisconsin, *Judicial decisions, *Riparian rights, *Zoning, *Water pollution, Legal aspects, Navigable waters, Lakes, Navigable rivers, Flood plains, Water quality control, Water quality, State jurisdiction, Land use, Watersheds(Basins), Land management, Riparian land, Water pollution control, Water policy, Water law, Water management(Applied), Water allocation(Policy), Environmental effects.
Identifiers: Private interest groups, Public trust doctrine, Water rights(Non-riparians), State policy.

An important dimension has been added to zoning variance or amendment application procedure for all land either exhibiting or in proximity of navigable waters in Wisconsin. The uses made of land adjacent to water bodies and in flood plains and watersheds affect water quality. The Wisconsin Supreme Court established the state's right as trustee of shorelands to restrict private land use for water quality protection. This trusteeship when considered in light of the Shoreland Zoning Act, places the Department of Natural Resources (DNR) in the role of an interested person within the mandatory notice provision of municipal and county zoning statutes. Notice of application for a zoning variance as a condition precedent to establishing the jurisdiction of the board of review must be given to the DNR. Failure to do so will render void any action taken by the board of review. (Dillingham-Florida)

FISHERY PROPOSALS IN THE UNITED NATIONS SEABED COMMITTEE: AN EVALUATION,
Utrecht Rijksuniversiteit (Netherlands). Inst. of Public International Law.
A. W. Koers.
Journal of Maritime Law and Commerce, Vol 5, No 2, p 183-209, January 1974. 145 ref.

Descriptors: *United Nations, *Organizations, *Fisheries, *Fish management, *International law, *Commercial fishing, *International waters, Foreign trade, Aspects, Law of the sea, Fish conservation, Fish migration, Fish populations, Fish types, Research.
Identifiers: *Resource allocation, *International agreements, *Coastal zone management, *Territorial waters, *Territorial seas(Jurisdiction).

The developed international law of marine fisheries deals with five major problem areas: allocation of marine fisheries resources among the nations of the world; prevention of the exploitation of the living resources of the sea from exceeding biological regenerative potential; full use of the resources; inplementation of economic efficiency of marine fishing operations; and research. Proposals submitted to the United Nations Seabed Committee to deal with these problems are examined. The most important factor in determining the allocation of fishery resources is the width coastal nations have established for exclusive fishery waters. The objective of most international fisheries agreements and organizations to facilitate conservation is to limit the catch of fishery stocks. Effective conservation measures have been applied to only a small number of fishes. The degree of utilization of specific stock should be determined by economic factors. Overcapitalization occurs in most commercially attractive high seas fisheries due partly to non-regulation of fishing operations on the high seas. Research requires international cooperation. Proposals of Kenya, Australia, and New Zealand, Canada, Soviet Union and the United States to deal with fishery problems are included. The respective projects are evaluated by their local and international effects. (Sperling-Florida)

MOSS ROSE MANUFACTURING CO. V. FOSTER (ACTION FOR RECOVERY OF WATER DAMAGE CAUSED BY SEEPAGE).
314 A.2d 25 (1974).

Descriptors: *Pennsylvania, *Judicial decisions, *Water storage, *Cisterns, *Seepage, Storage tanks, Water tanks, Water control, Seepage control, Negligence, Damages, Percolation, Groundwater movement, Percolating water, Subsurface drainage, Adjudication procedure.
Identifiers: Absolute liability, Water rights(Non-riparians).

Appeal was made to the Superior Court of Pennsylvania from a judgment for the plaintiff-appellee for property damage caused by water seepage from appellants' underground cistern. The parties in this action were manufacturing companies located adjacent to each other. Appellants maintained a large cistern below the basement of their premises. It overflowed and the water percolated through the soil column and, seeping into the appellee's basement caused considerable property damage to plaintiff's property. Appellants contend that there was insufficient evidence to support a finding of negligence. Appellees contend that their neighbors are liable on negligence principles for failing to reasonably maintain the cistern. The lower court found appellants liable for negligently maintaining the cistern and on a theory of absolute liability of the landowner. The Superior Court affirmed the negligence count and declined to rule on the absolute liability. (Dillingham-Florida)

PEOPLE V. OCEANA TERMINAL CORP. (PROSECUTION FOR AN OIL SPILL).
352 N.Y.S.2d 818 (1974).

Descriptors: *New York, *Judicial decisions, *Oil spills, *Water pollution sources, *Enforcement, Oil industry, Oil pollution, Legislation, Navigable waters, Water pollution, Water law, Civil law, Storage tanks, Water quality control, Waste disposal, Local governments, Water pollution control, Adjudication procedure, Water rights, Administrative agencies, Adoption of practices, Administrative decisions, Environmental effects, Legal aspects.
Identifiers: *Hazardous substances(Pollution).

An oil storage terminal company was prosecuted for an oil spill. The prosecution alleged that the spill violated the statute proscribing the disposal of offensive matter into navigable waters. The spill occurred when an 8-inch check valve with no prior indicated defect broke at the terminal, leaking a large quantity of oil into the river. The trouble point had been inspected only 20 minutes before the break occurred. The whole system was constantly under surveillance. The prosecution contended that the spill was within the purview of a statute intended to punish the dumping of garbage and like wastes and that terminal owners were civilly liable. The defendants were willing to plead guilty but the court dismissed the case. The court held that the statute proscribing the disposal of waste matter into the river was not intended to include oil spills and that the defendants could not be held civilly liable for environmental damage caused when pipes suddenly break without prior indicated defect. (Dillingham-Florida)

MCCALL V. PRESLEY (SEEKING MANDAMUS FOR ISSUANCE OF BUILDING PERMIT).
512 S.W.2d 693 (Tex App 1974).

Descriptors: *Texas, *Judicial decisions, *Legal aspects, *Regulation, *Water supply, *Construction, Permit, Land tenure, Municipalities, Administrative agencies, Decision making, Adoption of practices, Conduit, Water distribution(Applied), Water shortage, Water system, Administration, Planning, Equity, Adjudication procedure, Water allocation(Policy), Water management(Applied), Comprehensive planning.
Identifiers: *Injunctive relief.

Property owners sought a writ of mandamus requiring the issuance of a building permit. The district court rendered a judgment in favor of the property owners. On appeal the city prevailed. The court held there was not enough water to supply a house which the owners proposed to build. There was also no water line sufficient to provide fire protection for the proposed house. This reversal on appeal was in accordance with the decision of the city board of appeals which denied the permit, notwithstanding an arrangement whereby a neighbor had given owners permission to connect the water facilities of the proposed house to the neighbor's line which was connected with the city water system. Orders of the water commission are presumed legal and valid and the burden is on the party appealing from the order of the commission to show that the order is not reasonably supported by substantial evidence. PEOPLE EX REL GAZLAY V. MURRAY (ACTION TO ENJOIN FILLING PARCEL OF SUBMERGED LAND).
221 N.W.2d 604 (Ct App Mich August 13, 1974).

Descriptors: *Land tenure, *Federal government, *Michigan, *Administrative agencies, *Legal aspects, *Submerged lands, Beds, Bay, Meanders, Ownership of beds, State governments, Land reclamation, Land use, Land development, Real property, Conservation, Natural resources, Water law, Accretion(Legal aspects), Boundaries(Property).
Identifiers: Fill permits.

Action was brought by the Michigan Department of Natural Resources to enjoin the defendant from filling a parcel of submerged land located in Mallard Bay. The circuit court found that the defendant's federal land patent covered neither the Bay nor the land claimed. The court of appeals held that unless the land in question was transfered by the federal government by patent prior to Michigan's admission to the Union, the land in question belonged to the people of the state. The court also held the patent did not cover the land in question, that the state was not estopped from claiming title to the land because it approved the supervisor's plat which contained part of the land in question, and that the Marketable Record Title Act doesn't apply against the state. The federal government did not patent land by entire sections where the section was cut off by navigable water, but only conveyed fractional parts up to a meander line or at most to the water's edge. (Sperling-Florida)
W75-03460

PACIFIC NORTHWEST BELL TELEPHONE CO. V. U.S. (ACTION SEEKING DAMAGES FOR DAMAGE TO SUBMARINE TELEPHONE CABLE).
378 F Supp 297 (WD Wash, July 9, 1974).

Descriptors: *Judicial decisions, United States, *Legal aspects, *Legislation, *Permits, Economic aspects, Washington, Navigation, Ships, Decision making, Conservation, Admiralty, Adoption of practices, Jurisdiction, Lakes, Planning, Federal government, Adjudication procedure.
Identifiers: Liability(Legal aspects), Immunity(Legal aspects), Sovereign immunity.

Action was brought by the Pacific Northwest Bell Telephone Company against the United States of America in the Western District of Washington. The company alleged damage to a submarine telephone cable allegedly caused by the negligence of the United States Coast Guard. There was a clause in the permit to lay submarine telephone cable in navigable waters of the lake, which attempted to immunize the United States from liability from future navigation, conservation or improvement operations. The court held the clause to be invalid, both under the Public Vessels Act, and under the 1960 amendments to the Suits in Admiralty Act. These acts were designed to subject the United States to maritime tort liability to the same extent as private persons, so the clause could not immunize the United States from liability for alleged negligence in causing damage to a cable. (Sperling-Florida)

UNITED STATES V. RAVEN (APPEAL FROM CONVICTION FOR FAILING TO REMOVE SUNKEN VESSEL AND OBSTRUCTING NAVIGABLE WATERWAY).
500 F 2d 728 (US Ct Ap, 5th Cir 1974).

Descriptors: *Florida, United States, *Rivers and Harbors Act, *Judicial decisions, *Navigable waters, Ships, Vessels, Legislation, Safety, Public health, Environmental sanitation, Legal aspects, Channel, Adoption of practices, Decision-making, River, Bodies of water, Water law, Adjudication procedure.
Identifiers: Navigational obstruction, Liability(Legal aspects), Injunctive relief, Information(Prosecution).

An appeal was made of a conviction, in Florida, for failing to properly mark a sunken vessel, obstructing a navigable waterway, and failing to remove a sunken vessel. The court held that the legislation prohibiting obstruction of navigable waters generally applied to a sunken vessel. The Rivers and Harbors Appropriation Act of 1899 prohibited obstruction of navigable waters by vessels. However, this statute is not limited to those vessels that are sunk as the result of wrecks, but extends to derelicts sunk from other causes. If violating this statute requires a deliberate act then proof that the vessel after being severely damaged in a storm was left in a river for three months was sufficient to show a deliberate act. The purpose of the statute, requiring sunken vessels to be marked and removed in a navigable channel is the protection of other vessels plying the same waters. (Sperling-Florida)
W75-03462

JACKSON V. TEXAS WATER RIGHTS COMMISSION (SUIT SEEKING CANCELLATION OF COMM'N. ORDERS DESIGNATING UNDERGROUND WATER CONSERVATION DISTRICT).
512 SW 2d 696 (Tex App 1974).

Descriptors: *Texas, *Judicial decisions, *Legal aspects, *Water conservation, *Administration, *Administrative agencies, Adoption of practices, Planning, Groundwater, Legislation, Decision making, Regulation, Political subdivisions, Water resources, Water resources development, Comprehensive planning, Enforcement, Conservation, Adjudication procedure.
Identifiers: Administrative regulations, State policy, *Environmental policy, Liability(Legal aspects).

Action was brought seeking the cancellation of orders of the Texas Water Rights Commission designating an underground water conservation district. The lower court held against the plaintiffs. On appeal it was held the suit was moot in that the orders were cancelled when an election refused to confirm the district. The Court of Civil Appeals is not empowered to write advisory opinions. Section 51.034(a) of the Texas Water Code provides that if the majority of those voting at an election vote in favor of the confirmation of the district, the district is confirmed and ratified. However, if the majority of those voting at the election vote against the confirmation of the district, the district shall have no further authority, except that any debts incurred shall be paid and the organization of the district shall be maintained until all the debts are paid. (Sperling-Florida)
W75-03463

A. H. SMITH SAND AND GRAVEL CO. V. DEPT. OF WATER RESOURCES (ACTION DEALING WITH FILLING OPERATIONS IN FLOODPLAIN).
313 A 2d 820 (Md App 1974).

Descriptors: *Maryland, *Judicial decisions, *Flood plain, *Flood plain zoning, *Flood control, Deposition(Sediments), Floods, Non-structural alternatives, Eminent domain, State jurisdiction, Legal aspects, Administrative agencies, Water pollution control, Pollution abatement, Industrial effluents, Industrial wastes, Sedimentation, Administrative decisions.
Identifiers: Administrative regulations.

Appeal was made by a sand and gravel company from a Circuit Court order which affirmed the order of the Maryland Department of Water Resources (DWR) requiring that no filling operations should take place on appellant's land which is situated within a fifty-year flood plain. The

court modified DWR's order by redefining the boundaries of the floodplain established by DWR. DWR had appropriated a portion of appellant's land for flood control purposes. Appellant contended that this action constituted an unreasonable restriction upon the use of its property. DWR argued the appropriation was necessary for flood control. The Court of Appeals held that the order did not deny the appellant all reasonable use of its property within compensation. The redetermination of the floodplain boundaries was warranted because new information indicated flood periodicity was less than 50 years. The Circuit Court's decision was affirmed. (Dillingham-Florida)
W75-03464

COMMONWEALTH V. BOROUGH OF GALETON (PETITION TO ENFORCE CLEAN STREAMS LAW).
312 A 2d 812 (1973).

Descriptors: *Pennsylvania, *Judicial decisions, *Law enforcement, *Penalties(Legal), *Water quality control, State governments, Administrative agencies, Local governments, Legislation, Water law, Legal aspects, Management, Legal review, Regulation, Governmental interrelations, Non-structural alternatives, Water resources development, Water policy, Adjudication procedure, Water pollution control, Municipal wastes, Local governments.
Identifiers: State policy.

Petitioner Pennsylvania state agency brought action seeking enforcement of an order issued pursuant to the Clean Streams Law (CSL) and asking that the respondents, the borough and named public officials thereof, be adjudged in contempt pursuant to that law. The respondents filed a motion to strike for petitioner's failure to name all those officials in office at the time the petition was filed. The petition named those individuals in office at the time the original department order was issued. The Commonwealth Court found that the dominant purpose of the contempt procedure under the Clean Streams Law is remedial in nature, as a means of coercing local authorities into compliance. Accordingly, the court ruled that the petitioner must include in its petition all those persons who are members of the concerned local governing body or bodies at the time of the filing of the petition, but need not include former public officials. The petition was dismissed with leave to amend. (Deckert-Florida)

IN RE BARKER SARGENT CORP (APPEAL FROM ENVIRONMENTAL BOARD DECISION).
313 A 2d 669 (Vt 1973).

Descriptors: *Judicial decisions, *Land use, *Landfills, *Sanitary engineering, *Environmental effects, Environmental sanitation, Environmental engineering, Land development, Land management, Air pollution, Aesthetics, Noise pollution, Administrative agencies, *Vermont, Land use, Permits, Public rights, Public benefits, Legal aspects, Administrative decisions, Social aspects, Wildlife, Wildlife conservation, Conservation.
Identifiers: Administrative regulations, State policy, Licenses, Nuisance(Legal aspects).

An appeal was made by adjacent landowners from an administrative decision of the Vermont Environmental Board granting a land use permit to a sanitary landfill in the town of Thetford. In evaluating the validity of the issuance of the land use permit, the court examined the applicable sections of the state statute. The statute provides that the town must show that undue air or water pollution will not result before granting the permit. The appellant argues that the Board was in error in finding that the proposed landfill would not create air pollution. Appellants contend that air pollution can be caused by the creation of noise, and that such noise would be created by development of the landfill. Appellants asserted that wildlife and local scenery would suffer. Appellee argued that any adverse wildlife and visual effects would be minimal, and noise would be subdued. The court sustained the ruling of the Environmental Board concluding that it is necessary to place sanitary landfills somewhere, and merely offending the feelings of adjacent landowners has no validity. (Sperling-Florida)
W75-03466

CAPPTURE REALTY CORP. V. BOARD OF ADJUSTMENT (SUIT CHALLENGING DENIAL OF SPECIAL EXCEPTION USE–CONSTRUCTION IN FLOOD PLAINS).
313 A 2d 624 (1973).

Descriptors: *New Jersey, *Flood plains, *Flood plain zoning, *Flood control, *Judicial decisions, Zoning, Flood protection, Streams, Civil engineering, Drainage systems, Reasonable use, Surface runoff, Comprehensive planning, Long term planning, Decision making, Legislation, Legal aspects, Water law, Administration, Administrative decisions, Water zoning, Water policy, Land use, Land management, Regulation.

Plaintiff landowner was denied a special exception to an interim moratorium for construction in flood prone areas by the defendant Board of Adjustment. In seeking reversal of that denial plaintiff contended that the moratorium, imposed while the municipality considered options for flood control improvements, represented an unconstitutional taking of property under the fourteenth amendment by denying plaintiff the right to improve his lands. The defendant responded that the moratorium was a stopgap measure to allow time for construction and design of adequate flood prevention mechanisms, and as such was a legitimate exercise of police power exercised for the public welfare. The court noted that plaintiff, if allowed to construct his industrial area, would increase rain water runoff into already over-burdened streams as well as subjecting himself to future flooding. The length of the moratorium, limited to one year, was a reasonable exercise of zoning powers to allow proper study and construction of the improvements, and therefore was not an abuse of police powers. However, since the value of the land zoned for industrial use was limited by the moratorium, the court agreed with plaintiff that it was inequitable not to adjust the tax rate imposed on that land for the duration of the moratorium. The considerable problems that periodic flooding posed to the general welfare justified the reasonable imposition of construction limitation through temporary zoning, and plaintiff's claim of right to an exception was denied. (Salley-Florida)
W75-03467

COMMONWEALTH V. WASHINGTON TOWNSHIP (ACTION TO ORDER COMPLIANCE WITH CLEAN STREAMS LAW).
316 A 2d 107 (Pa Cmwlth 1974).

Descriptors: *Pennsylvania, *Judicial decisions, *Sewage effluents, *Local governments, *Adjudication procedure, Streams, Sewerage, Sewage disposal, Sewage treatment, Water pollution, Water pollution sources, Administrative agencies, Ecology, Law enforcement, Penalties(Legal), Jurisdiction, Water law, Water pollution control, Pollution abatement, Legislation Water policy.
Identifiers: Administrative regulations, Effluent limitations, State policy.

An action was brought by the Commonwealth of Pennsylvania against various local government agencies to enforce the final orders of the Department of Environmental Resources (DER) requiring the respondents' agencies to negotiate and enter into agreements for the planning, designing, financing and operating of sewage facilities within their respective territories. The Commonwealth contended that the respondents failed to comply with the various orders of the DER and that they should be compelled to do so under the Clean Streams Law (CSL). The Respondents countered that the pertinent section of CSL did not provide for the enforcement of sewage pollution abatement procedures and that the suit had been brought improperly. The Court held that it did not have the jurisdiction to enter the Commonwealth's petition as filed because the section of the CSL under which the Commonwealth sought relief did not expressly provide for direct enforcement of an order. The Court ordered the case dismissed without prejudice so that the Commonwealth might institute an action under the proper enforcement sections of CSL. (Dillingham-Florida)
W75-03468

MUSUMECI V. STATE (ACTION BY DOWNSTREAM LANDOWNERS TO RECOVER FLOODING DAMAGES CAUSED BY RELOCATION OF HIGHWAY).
351 NY S 2d 211 (1974).

Descriptors: *New York, *Judicial decisions, *Floods, *Streams, *Highway relocation, Highways, Right-of-way, Surface runoff, Vegetation effects, Drainage water, Surface drainage, Riparian land, Riparian rights, Construction, Road construction, Engineering structures, Drainage engineering, Channeling, Culverts, Legal aspects.
Identifiers: Nuisance(Legal), Water rights(Non-riparian).

Action was brought by downstream landowners against the State of New York to recover for damages caused by flooding allegedly caused by the State's relocation of a highway. During the construction and relocation of Route 57 the vegetation on the right-of-way was removed. Drainage ditches collecting surface run-off water from the highway were constructed, and culverts concentrating and channeling these waters into a nearby creek were built. These measures taxed the stream beyond its capacity and caused it to overflow onto the claimants' property. Landowners contended that the flooding was caused by the construction of the highway while the State claimed it was caused by an abnormally heavy rainfall. The New York Supreme Court held that the State has no greater right than an individual to collect surface water from its lands into an artificial channel and to discharge it upon the lands of another, nor has it any legal immunity for creating nuisances. The State was held liable to the downstream owners for the flooding of their lands. (Dillingham-Florida)
W75-03469

SMITH V. HADAD (PETITION TO REGISTER AND CONFIRM TITLE TO LAND).
314 NE 2d 435 (Sup Jud Ct Mass 1974).

Descriptors: *Massachusetts, *Judicial decisions, *Legal aspects, *Land tenure, *Boundary disputes, Streams, State governments, Decision-making, Planning, Adoption of practices, Measurement, Watercourse, Water resources, Water law, Boundaries(Property), Water policy.
Identifiers: Easements.

Action was brought to confirm title to land. The land court ordered registration as applied for except for a thirty-three foot strip. On appeal the court held that in the absence of a clear showing of a contrary intent, where the boundary of a tract was described in a deed as running westerly one-hundred and seventy-five feet from a named street, there was a presumption that the measurement was from the sideline of the street. Massachusett's rights in the street were by way of easement rather than in fee simple absolute. After the taking of an easement for a public way the fee to the underlying land remains in adjoining property owners. The court after reviewing the weight of

authority held in the absence of a clear showing of a contrary intent, a measurement given from a stream or public or private way shall be presumed to begin at the side line of that stream or way. (Sperling-Florida)
W75-03470

JEWETT V. REDWATER IRRIGATING ASSOCIATION (ACTION FOR ADJUDICATION OF WATER RIGHTS).
220 NW 2d 834 (S Ct SD 1974).

Descriptors: *South Dakota, *Judicial decisions, *Water rights, *Water allocation(Policy), *Adjudication procedure, Water requirements, Irrigation, Water demand, Water delivery, Legal aspects, Land tenure, Streamflow, State governments, Rivers, Water resources, Water supply, Water shortage, Water utilization, Legal review, Water distribution(Applied), Water supply development.
Identifiers: Standing(Legal aspects).

An action was brought for the adjudication of water rights against the Redwater Irrigating Association and the South Dakota Water Resources Commission. The plaintiffs demanded delivery of irrigation water from the irrigation association. The Commission sought a declaratory judgment asserting their control over the water rights in the entire river irrigation system. The Circuit Court entered judgment for the plaintiffs. The Supreme Court affirmed holding where plaintiff's predecessor in title to land did not succeed to the water right located by another, the water used for irrigation of the land did not gain the status of an appurtenance. Therefore, the water was not used as a matter of right by the landowner. Where the grant or refusal to grant additional water to plaintiffs did not affect other water users above or below the stream, the state was not required to join the other claimants of water rights as parties in order to obtain a complete adjudication of the entire river irrigation system. (Sperling-Florida)
W75-03471

CAMPBELL V. VILLAGE OF OQUAWKA (ACTION TO ENJOIN CITY FROM MAINTAINING A LEVEE ABUTTING ITS PROPERTY).
307 N.E.2d 418 (Ill App 1974).

Descriptors: *Illinois, *Judicial decisions, *Levees, *Relative rights, *Local governments, Water management(Applied), Flood protection, Legal aspects, Equity, Flood routing, Flood control, Legal review, Public rights, Water policy, Land tenure, Eminent domain.
Identifiers: Injunctions(Mandatory).

Plaintiff landowner sought an injunction against defendant municipal corporation compelling removal of an emergency levee constructed by the defendant along the street abutting the plaintiff's property. The lower court ordered removal of the levee from a portion of the street in front of the plaintiff's premises, but refused to compel removal along the entire block in which the plaintiff's property was located. On appeal by the plaintiff, the Appellate Court of Illinois affirmed the lower court ruling. In a memorandum opinion, the appellate court ruled that owners of property abutting a street have a right to use of their property, including the right of ingress and egress over and by means of the adjacent portion of the street, but the rights of such owners, particularly riparian landowners, are subservient to the public need for protection from floodwaters. In the absence of any arbitrary action or abuse of police power by the village in constructing a levee for emergency flood protection, such owners are limited to an action for damages. (Deckert-Florida)
W75-03472

STATE EX REL. INDIANAPOLIS WATER CO. V. BOONE CIR. CT. (ACTION BY WATER COMPANY FOR WRIT OF PROHIBITION).
307 N.E.2d 870 (Ind 1974).

Descriptors: *Public utilities, *Legal review, *Adjudication procedure, *Administrative decisions, *Indiana, Water law, Legal aspects, Water allocation(Policy), Judicial decisions, Public rights, Equity, Contract administration, Administrative agencies, Water distribution(Applied), Governments, Regulation, Water supply.
Identifiers: Class action suits, Administrative regulations.

Plaintiff, water company and its wholly owned subsidiary, brought action for a writ of prohibition barring the Circuit Court from further proceedings in a pending class action, brought by customers of the water company to recover damages for alleged misconduct and improper rate charging. The realtors contended that the conduct in question was at all times known to the Public Service Commission and the Commission did, in fact, consider the disputed conduct in determining the rates to be charged. The respondents position was that an Indiana statute and prior decisions of the Indiana Supreme Court allowed them to pursue a judicial remedy when dissatisfied with rates charged by a business affected by the public interest. The Supreme Court held that this rule did not apply where the legislature has provided a regulatory structure, in this case the Public Service Commission, and where there was no fraudulent concealment of information on the part of the regulated business. The court held that the proper remedy for the respondents was an administrative appeal from the action of the Commission rather than an action for damages. An alternative writ was issued. ROBERT E. NILLES, INC. V. ILLINOIS POLLUTION CONTROL BD. (ACTION AGAINST POLLUTION CONTROL BOARD FOR DENIAL OF SEWERAGE PERMITS).
308 N.E.2d 640 (Ill App 1974).

Descriptors: *Illinois, *Judicial decisions, *Water quality control, *Non-structural alternatives, *Legal review, Waste water(Pollution), Permits, Water management(Applied), Legal aspects, State governments, Administrative agencies, Legislation, Waste water disposal, Water quality, Water law, Adjudication procedure, Sewage, Water pollution, Water pollution control, Water pollution sources, Water resources development, Adoption of practices.
Identifiers: *Administrative regulations, Presumptions(Legal).

Petitioner corporation sought a variance without hearing from an order of the Illinois Pollution Control Board withdrawing sewer connection permits previously granted to the petitioner. The petition for a variance was summarily dismissed by the Board on the grounds that there was no proof that compliance with the order would impose an arbitrary or unreasonable hardship on the corporation. The Appellate Court of Illinois overturned the Board's decision. The court ruled that the corporation's petition alleged facts sufficient to support a claim of arbitrary or unreasonable hardship and thus petitioner was entitled to a hearing on the merits. A condition imposed on issued permits, that if any statement in the application was found to be incorrect, the permit might be revoked and all rights thereunder lost, did not limit the petitioner's future right to seek a variance or a new permit, nor did it interfere with the petitioner's right to claim equitable estoppel or estoppel in pais. Administrative boards have broad discretionary powers, but such powers must be exercised judiciously, not arbitrarily. (Deckert-Florida)

MEHLING V. DEINES (ACTION TO COMPEL DEFENDANT TO REOPEN DITCH TO PROVIDE PROPER DRAINAGE).
214 N.W.2d 627 (Neb 1974).

Descriptors: *Groundwater, Management, *Nebraska, *Judicial decisions, *Prescriptive rights, *Water law, Water flow, Groundwater movement, Runoff, Water sources, Groundwater runoff, Potential flow, Discharge, Prescriptive rights, Legal aspects, Water rights, Water policy, Irrigation, Irrigation canals, Irrigation ditches, Water management(Applied), Irrigation practices, Administration, State governments.
Identifiers: Presumptions(Legal), Water rights(Non-riparians).

Action was brought by the plaintiff-appellant, a landowner, to compel the defendant-appellee, an adjacent landowner, to reopen a ditch to provide drainage for the plaintiff's land. Defendant closed the ditch after sustaining crop damage from the run-off of plaintiff's irrigation water. Plaintiff contended that he had acquired an easement by prescription to drain water from his land through the extension ditch on the defendant's land. The court affirmed the lower court and held that plaintiff's proof failed to establish his prescriptive right for drainage across the defendant's land. The court explained that the common practice in the local area was to use drainage ditches established by the regional management district to dispose of irrigation waste water. The plaintiff used the ditch on the assumption that it was a district ditch. Therefore the use was permissive and not adverse and no claim of right was established. A use by express or implied permission or license cannot repen into an easement by prescription. (Sperling-Florida)

PIERCE V. RILEY (ACTION BY LAKE OWNERS FOR INJUNCTIVE RELIEF).
215 N.W.2d 759 (Mich App 1974).

Descriptors: *Michigan, *Riparian rights, *Relative rights, *Reasonable use, *Equity, Judicial decisions, Legal aspects, Water law, Land tenure, Non-structural alternatives, Adjacent landowners, Easements, Riparian land, Water rights, Land use, Legal review, Central United States, Canals, Water resources development, Water allocation(Policy), Preferences(Water rights), Water distribution(Applied), Water policy.
Identifiers: Injunctive relief, Water rights(Non-riparian).

Owners of lake property sought declaratory and injunctive relief against owners of a single lot through which a canal was constructed to provide access to the lake to ninety non-riparian lots. These lots were also owned by the defendants and were being developed as if the entire project had riparian rights. This plan would have increased the number of residents having access to the lake by sixty-six percent. The lower court enjoined the defendants from granting any of the non-riparian lot owners right-of-way easements to the canal, but refused the plaintiffs' request that the canal be ordered filled. Plaintiffs appealed, contending the lower court's order could not be effectively enforced. Defendants asserted that since the plaintiffs did not specifically request the canal be filled in their prayer for relief, the courts had no power to issue such an order. The Court of Appeals of Michigan ruled that since this action was equitable in nature, the courts were not bound by the prayer for relief. Finding the proposed project sufficiently injurious to the riparian owners as to constitute an unreasonable use, the Court of Appeals reversed the lower court and ordered the canal filled. (Deckert-Florida)
W75-03476

COMMONWEALTH OF KENTUCKY, DEPARTMENT OF HIGHWAYS V. FITZPATRICK

(EMINENT DOMAIN ACTION FOR TAKING OF RIVER BOTTOM LANDS).
504 S.W.2d 687 (Ky 1974).

Descriptors: *Kentucky, *Judicial decisions, *Road construction, *Property values, *Adjudication procedure, Right-of-way, River basins, Highways, Roads, Market value, Land appraisals, Pricing, Real property, Land tenure, Land use, Evaluation, Land, Eminent domain, Administrative agencies, Administration, Compensation, State policy.

Condemnation action was brought by the Kentucky Department of Highways to acquire right-of-way for construction of a highway through respondent's land. The Circuit Court awarded landowners $150,000.00 The Department on appeal contended that the award was excessive. The landowners countered that the award for taking 29.89 acres of river bottom land and level-to-rolling land located in a county where level land was in short supply was not excessive. The Court of Appeals held that the issue of the award was a jury issue and that the verdict rendered was supported by the evidence. The land, that the state had taken, was a portion of the most valuable in the county and therefore the verdict was not excessive. Judgment was affirmed. (Dillingham-Florida)
W75-03477

BEANE V. PRINCE GEORGE'S COUNTY (ACTION FOR DAMAGES FOR UNNATURAL WATER FLOW).
315 A.2d 777 (Md App 1974).

Descriptors: *Maryland, *Judicial decisions, *Outlets, *Discharge(Water), *Damages, Surface runoff, Surface waters, Drainage, Drainage effects, Drainage systems, Drainage engineering, Local governments, Urban drainage, Drainage water, Road construction, Pipes, Subsurface drains, Legal aspects, Water, Water policy.
Identifiers: Injunctive relief, Nuisance(Legal).

Landowners brought action against owners of adjacent property for alleged invasion of privacy, interference with pursuit of business, and slander of plaintiffs' title. The subject of the controversy was the improvement of a road near the litigants' property which involved installation of catch basins and a metal drainage pipe extending from that road past four residences including defendant's onto plaintiff's property, where it terminated in an outfall. Defendant landowners counterclaimed for water damages whereupon plaintiffs counterclaimed for damages and injunction prohibiting the county from further allowing unnatural surface water to flow on plaintiffs' land. Plaintiffs asserted that the outfall caused continuing damage to his property. The county asserted that there was no actual damage but merely a technical violation whose correction did not justify the county's effort and expense. The court did not agree that of the remedial alternatives proposed by the county none was practicable and at the same time reasonable in cost in proportion to the continuing damage suffered as a result of the continuing discharge of surface water. The court granted injunctive relief to the plaintiffs against the county. (Dillingham-Florida)

OLIVER V. MILLIKEN AND FARWELL, INC. (ACTION INVOLVING DIVISION AMONG RIPARIAN OWNERS OF ALLUVIAL DEPOSITS).
290 So. 2d 738 (La 1974).

Descriptors: *Louisiana, *Judicial decisions, *Accretion(Legal aspects), *Riparian rights, *Ownership of beds, Beds under water, River beds, Bottom sediments, Navigable rivers, Rivers, Navigable waters, Riparian land, Property, Surveys, Legal aspects, Prescriptive rights, Boundaries(Property), Mapping, Topography, Erosion, Sediments, Bank erosion, Beds.

The action involves the division among riparian owners of alluvial deposits known as Solitude Point which contains approximately 3,500 acres and is located on the west bank of the Mississippi River in the Parish of West Baton Rouge. Plaintiff-appellant and defendant-appellee are adjacent plantation owners who both alleged acquisitive prescription of various portions of Solitude Point. The trial court and the 1st Circuit Court of Appeal held that the evidence presented by the principal defendant did not establish its continuous, uninterrupted, actual, physical and corporeal possession of all of the controverted property, nor did it establish the location and extent of the batture that it allegedly possessed for 30 years. The court further held that the alluvion as an entirety should be apportioned as of the time that the suit to divide that alluvion was commenced. In dividing it among riparian owners the frontage to frontage method was properly used where it would produce the fairest results for all of the riparian owners, other methods resulted in inequitable division. (Dillingham-Florida)

ASKEW V. TAYLOR (ACTION FOR EQUITABLE RELIEF AGAINST STATE FOLLOWING DENIAL OF APPLICATION FOR DREDGE AND FILL PERMITS FOR BOTTOMLANDS).
299 So. 2d 72 (1st D.C.A. Fla 1974).

Descriptors: *Florida, *Judicial decisions, *Legal aspects, *Land tenure, *Fill permit, Regulation, Environmental effects, Administration, Planning, Decision making, Economic aspects, Administrative agencies, Water resources, Application methods, Water resources development, Adjudication procedure, Permits, Local governments, Equity, Contracts.
Identifiers: State policy.

Action was brought by a successor in interest to a purchaser of bottomlands against Reuben Askew, the governor of Florida. The plaintiff prevailed in the lower court and on this appeal from that decision in his request for relief against the state following the denial of his application for a dredge and fill permit. Plaintiff's predecessor had paid the purchase price to the Internal Improvement Fund. It was clearly intended that filling would take place out to the then-established bulkhead line and it was on that basis that the trustees fixed the price. Before executing the deed it is assumed the trustees of the fund had made findings to make their acts legal. No loss or legal injury would be suffered by the trustees of the fund of the state by granting relief seven years after the sale of state-owned submerged land. The slight, if any, changes in ecological conditions which had taken place could not impair the legal rights of the plaintiff. (Sperling-Florida)

Identifiers: *National Environmental Policy Act, Environmental policy, Administrative regulations, Environmental impact statement, FWPCA Amendments of 1972.

Many aspects of the Department of Housing and Urban Development's activities are affected by recently passed federal environmental protection legislation. The effects of this legislation upon the Department's present activities and upon the future production and preservation of the nation's housing supply are analyzed. Examined specifically are the effects of the National Environmental Policy Act, Executive Order 11514, and the guidelines promulgated by the Council for Environmental Quality. Also analyzed are the effects of recent legislation and regulatory action in the areas of air and water quality control and waste disposal. Also discussed are the actions taken by the Department to implement the Environmental Protection Act. While the environmental legislation and standards may lead to better quality housing, they may also result in a slow-down in the production of new housing, an increase in housing costs, and increased urban sprawl. Joint Publications Research Service, Arlington, Va.
Available from National Technical Information Service, U.S. Dept. of Commerce, Springfield, Va 22161 as JPRS-61048, $4.00 in paper copy, $2.25 in microfiche. January 23, 1974. 37 p, 10 ref.

Descriptors: *Environmental control, *Pollution, *Ecology, Meteorology, Water quality control, Governments, Pollution sources, Environmental sanitation, Water supply, Wastes, Sewage, Sewage treatment, Disposal, Environmental engineering, Water resources development, Water law, United States, International law, International joint commission, Environmental effects, Pollution abatement, Governmental interrelations, Federal government.
Identifiers: *International agreements, *Environmental policy.

The serial report contains translations from the world press of articles and press commentary on environmental pollution and its effects. Also discussed are pollution control technology, organizations, and programs. The articles were written by authors from Eastern Europe, Latin America, and the Soviet Union. Several themes run through the collection of articles. In order to avert an ecological crisis in the world, cooperation of Soviet and American scientists is necessary. Steps must be taken by both individual governmental entities and by nations working together to overcome rising pollution problems. Related to the world pollution problems is a discussion of the influences of future sanitation works as part of regional pollution abatement plans. Also discussed is the conser-

vation of available natural resources and the restoration of depleted resources where possible in order to protect the health and welfare of all. (Proctor-Florida)

REGULATORY MANAGEMENT PROGRAMS FOR FLORIDA MARINE FISHERMEN,
F. J. Prochaska, and J. R. Baarda.
Florida Sea Grant Publication SUSF-SG-74-003, 1974. 13 p, 1 tab.

Descriptors: *Fish management, *Commercial fishing, *Regulation, *Conservation, *Administration, Florida, Economic aspects, Cost-benefit analysis, Shellfish, Water resources, Administrative agencies, Planning, Aquiculture, Water resources development, Water management(Applied), Economic aspects, Regulation, Comprehensive planning.
Identifiers: Administrative regulations, State policy.

The management of a fishery is very different from the management of a business. Within a given fishing season a fisherman can manage his own operation for the greatest economic benefit to himself. Also, a factor in this business is maintaining the fishery for future production, however, because of a lack of property rights in the fishery resource he cannot, acting alone, manage the fishery resource in the long run. There is a common property ownership among the citizens of the State with fishery resources. As a consequence, management of fisheries falls largely on governmental bodies. The fishery management programs administered by the State of Florida to fishermen, marine extension agents, and others concerned with marine commercial fishing are described. The institutional framework and current regulatory systems of Florida fisheries management programs are summarized. Separate sections deal with lobsters, shrimp, and oysters. (Sperling-Florida)

DI VOSTA RENTALS INC. V. LEE (REVIEW OF DENIAL OF FILL PERMIT).
488 F.2d 674 (5th Cir 1973).

Descriptors: *Judicial decisions, *Florida, *Rivers and Harbors Act, *Legislation, *Decision-making, Adoption of practices, Navigation, Planning, Lakes, Construction, Navigable waters, Legal aspects, Administration, Administrative agencies, Estuarine environment, Water conservation, Water quality control, Water law, Water resources development.
Identifiers: Administrative regulations, Navigation obstructions, Fill permits, *Licenses.

Court action sought review of an order of the Secretary of the Army denying application for a permit to fill navigable waters of a lake. On the filled land an apartment building was to be constructed. The U.S. District Court for the Southern District of Florida ordered the permit issued. The Court of Appeals for the Fifth Circuit held the agency action could not be set aside unless appellee had shown arbitrary, capricious action or an abuse of discretion. The Secretary's denial was not improper in view of objections of other government agencies and private citizens that the filling would damage the lake which was a valuable estuarine area. The Fifth Circuit vacated the prior opinion and held that under the Rivers and Harbors Appropriation Act of 1899, which banned the obstruction of navigable waters, subject only to exceptions authorized by the Secretary of the Army, the court may review the legality of the Secretary's exercise of discretion but may not substitute its own judgment for that of the Secretary. BONELLI CATTLE CO. V. ARIZONA (QUIET TITLE ACTION).
94 S. Ct. 517 (1973).

Descriptors: *Arizona, *Judicial decisions, *Riparian land, *Legal aspects, *Accretion, Channelling, Colorado River Basin, Rivers, River beds, River training, Federal jurisdiction, Avulsion, Navigable rivers, Channels, Width, Riparian rights, Land, Land tenure, Submerged Lands Act, Channel improvement, Public lands, Water law, Water rights, Riparian land, Ownership of beds, Navigable rivers, Navigable waters.
Identifiers: Territorial waters, State policy.

Action was brought by riparian owner against the State of Arizona to quiet title to land which had once been submerged when the Colorado River had moved eastward, but which had reemerged as a result of a federal rechannelling project. Defendant claimed title as the owner of beds under navigable streams within its borders. Plaintiff asserted that whether river changes were accretive or avulsive, he held title as riparian owner. The U.S. Supreme Court granted certiorari and held that the ownership of subject land was governed by federal law. Land emerging by narrowing the river channel belongs not to the defendant state, as owner of the riverbed, but to the plaintiff riparian owner. The state could not claim the land which reemerged following the federal rechannelling project because public purpose was no longer served by state ownership. In view of the respective interests of plaintiff and defendant and in light of the rationale for the federal common law doctrines of accretion and avulsion, the surfacing would be treated as an accretion. Title vests in the riparian owner. (Dillingham-Florida)

LANDS LYING UNDER PUBLIC WATERS.
Vt Stat Ann Title 29, secs 401-409, (1967).

Descriptors: *Vermont, *Legislation, *Water law, *Water resources, *Water management, *Water structures, *Lakes, *Ponds, Land use, Land management, Filling, Dredging, Boundaries, Public rights, Water resources development, Wildlife conservation, Recreation, Recreation demand, Scenery, Dams, Navigation, Structures.
Identifiers: Public trust doctrine.

Public lands lying under lakes and ponds which are public waters of Vermont are a public trust. It is a policy of the state that these lands be managed in the public trust and to promote the general welfare by the Vermont water resources board (board). Unless authorized by the board, a person shall not in any manner place any material in or displace the public or boundary waters of the state with construction, fill or other artificial encroachment. Nor shall any person alter the bed of any lake or pond underlying such public or boundary waters. This act shall not be construed to prohibit erection of temporary removable seasonal type structures or construction of temporary or permanent private piers if ordinary navigation is not impeded. This act shall not apply to construction of dams. Any person desiring to construct a structure, or place any material upon the bed of a lake or pond which is a public water shall apply in writing to the board for authority to do so. In acting upon applications the board shall determine the public good based upon the effect to scenic and recreational values, fish and wildlife, hazards to navigation, and other public uses. (Silber-Florida)

DAMS.
Vt Stat Ann tit 30, secs 401-406, (1967).

Descriptors: *Dams, *Reservoirs, *Water levels, *Legislation, *Vermont, *Water law, *Water fluctuation levels, *Water utilization, Water control, Levees, Water resources, Water storage, Water management, Flood prevention, Watershed protection, Watersheds(Basins), Water management(Applied), Water levels, High water mark, Low water mark.

The Vermont public service board shall determine the maximum and minimum water levels of Lake Seymour, at the outlet, and have these levels certified and recorded. The waters of Lake Seymour shall not by any artificial means be raised higher or drawn lower, or permitted through neglect to become lower or higher, than the maximum and minimum levels established by the board. The board shall establish maximum and minimum levels of Great Averill Pond, Little Averill Pond, and Norton Lake, at their outlets. When such levels are so established, the board shall certify and record these levels. These waters shall not by any artificial means be raised higher or drawn lower, or permitted through neglect to become lower or higher, than the maximum and minimum levels established by the board, and penalties are prescribed for so doing. (Silber-Florida)

SCENERY PRESERVATION COUNCIL.
Vt Stat Ann, Title 10 secs 261-265, (1973).

Descriptors: *Vermont, *Legislation, *Conservation, *Preservation, *Natural resources, Land use, Scenery, Recreation, Resources planning, Natural use, Land resources, Land development, Land management, Land conservation, Scenic highways, Aesthetics.

The scenery preservation council (council) was established to preserve and enhance Vermont's scenic value. In conjunction with this enactment, the departments of highways, parks, fish and game, water resources and the board of historic sites may acquire land or rights and interests

therein to facilitate this goal. These departments may also improve the land acquired as to accommodate the traveling public. The council shall carry on a continuing comprehensive planning process to inventory and classify scenic corridors, areas and sites; to analyze the scenic values including the general location of areas of special need; and to make specific proposals for such new areas. The council shall also advise the state planning director in regard to the scenery preservation plan; encourage and assist in fostering public awareness, understanding, and participation in the objectives and functions of scenery preservation; and report biennially to the governor and general assembly upon the effectiveness of this act and any recommendations regarding scenic preservation. (Silber-Florida)

CONSERVATION--ALTERATION OF STREAMS.
Vt Stat Ann tit 10 sec 671-675, (1973).

Descriptors: *Vermont, *Legislation, *Water law, *Streamflow, *Routing, *Structures, *Alteration of flow, Flood control, Riparian rights, Wildlife conservation, Obstruction to flow, Erosion control, Bank stabilization, Bank protection, Fish, Wildlife, Currents(Water), Streams.

No person or municipality shall change, alter or modify the course, current or cross section of any stream containing ten or more square miles of drainage area, or along the boundaries of Vermont by use of construction equipment or similar mechanical devices. Fill or excavations of ten or more cubic yards is prohibited unless authorized by the water resources department (department). This act shall not apply to proper stream bank stabilization measures for protection of existing property or to construction of dams. A person or municipality proposing to change or diminish the course, current or cross section of a stream shall apply in writing to the department for authority to do so. The fish and game commission shall investigate each application to determine the effect of the proposed change upon the fish life. If the department finds the proposed change is reasonable, will not adversely affect the public safety by increasing flood hazards, will not damage fish, wildlife or the rights of riparian owners and is consistent with the public good, the applications will be approved. (Silber-Florida)

COMPENSATORY STORAGE,
C. J. Beise.
Rocky Mountain Law Review, Vol 22, p 453-461, 1950. 9 ref.

Descriptors: *Legislation, *Colorado River Basin, *Compensation, *Water storage, *Colorado, Water resources development, Reservoirs, Reservoir storage, Water distribution(Applied), Drainage areas, River basins, River basin development, Interagency cooperation, State governments, Legal aspects, Constitutional law, Hydroelectric power, Diversion tunnels, Distribution systems, Water management(Applied), Water distribution(Applied), Rocky Mountain Region.
Identifiers: *Administrative regulations, *Water rights(Non-riparians).

Compensatory storage has had a variety of applications and poses a problem to the full utilization of Colorado's water resources. The term refers to the problem of equitable apportionment of water between various parts of the state, notably the Eastern and Western slopes. Legislation during this century has attempted to provide replacement water through reservoir construction for the slope, from which water has been diverted for either a federal irrigation or hydroelectric power project. The recent Gunnison-Arkansas Project has sought to implement the technique of compensatory storage by creating committees to consider such issues as municipal demands, subordination of irrigation uses to power generation, water available for diversion, engineering problems and the principles of the project's operation. By creating a commission of representatives from the state, the federal government, the East and West slopes, it is hoped that in the public realm the state water distribution program will be based on equitable apportionment rather than priority. The priority doctrine written into the state constitution gives the first in time the first in right. An equitable apportionment policy best serves the interests of the state although its constitutionality can by questioned. (Dillingham-Florida)

OHIO V. WYANDOTTE CHEMICALS CORP., RESTATEMENT OF THE ORIGINAL JURISDICTION OF THE SUPREME COURT OF THE UNITED STATES,
D. K. Lloyd.
Environmental Law, p 358-367, Vol 2, No 2, Spring, 1972. 52 ref.

Descriptors: *Water law, *Judicial decisions, *Legal aspects, *Water pollution, *Ohio, Public rights, Nuisance(Water law), Discharge, Lakes, Pollution, Abatement, Mercury, Water policy, Pollutants, Water pollution sources, Jurisdiction, Federal government, State governments, Federal-state water rights conflict, Political aspects, Industrial waste, Industrial pollution, Regulation, Water management, Natural resources.

The State of Ohio sought to invoke the original jurisdiction of the United States Supreme Court in an action to abate a nuisance. The corporate defendants were all citizens of other states and countries. The alleged nuisance was the defendants' dumping of mercury into streams that eventually entered Lake Erie, resulting in contamination and pollution of the lake's water, vegetation, fish and wildlife. The U.S. Supreme Court declined its jurisdiction, noting probable jurisdiction of the Ohio state courts. Furthermore the Court stated that the capacity of trial courts to engage in fact finding procedures was more developed than that of the Supreme Court, notwithstanding their power to appoint masters and scientific experts to facilitate their own fact finding functions. Without referring to the list of positive and negative implications arising from the Wyandotte decision, the result seems to be an unequivocal statement that, at least in suits to abate nuisances, the Court will refuse to exercise jurisdiction where a state is suing the citizens of another state or country. MISSISSIPPI AND MISSOURI RIVER ISLANDS ARE PROPERTY OF STATE.
Mo Stat Ann, sec 241.291 (Supp 1973).

Descriptors: *Missouri, *Legislation, *Land forming, *Islands, Land, Land tenure, *Mississippi River, *Missouri River, Wildlife, Recreation, Wildlife habitats, Wildlife conservation, Legal aspects, State jurisdiction, State governments.

All lands which belong to the state of Missouri, which have been created by the formation of islands in the Missouri and Mississippi rivers have been granted and transferred to the Missouri conservation commission for wildlife protection purposes. If the islands are deemed to have no present or future value for wildlife use, they shall then be transferred to the state park board for recreational purposes. If they have no value for recreational purposes, they shall be transferred to the counties in which they are located. All islands created and formed in the Missouri and Mississippi rivers subsequent to enactment of this statute are also the property of the state and will be treated as indicated above. Descriptors: *National forests, *Land use, *Preservation, *Water conservation, Forestry, *Watersheds(Basins), Adoption of practices, Environment, Environmental effects, Administrative agencies, Comprehensive planning, Water management(Administrative), Water resources development, Judicial decisions, Project planning, Federal project policy.
Identifiers: *National Environmental Policy Act, *Environmental Impact Statements, *Wilderness Act, Council on Environmental Quality.

The Wilderness Act of 1964 has been interpreted by judicial decision to mean that the Forest Service is obligated to study areas contiguous to primitive areas for possible inclusion in the Wilderness Preservation System. Another court indicated that the above ruling was faulty. The contention that study of contiguous areas is obligatory is not supported by evidence of Congressional intent. The proposed wilderness system is to be confined to those areas of public land that have already been set aside for recreational use. The National Environmental Policy Act of 1969 was not intended to control every action by the Federal Government in the environmental field. Environmental impact statements were not intended to be an end in themselves. The Council on Environmental Quality was not established as an administrative group or to pass judgment on environmental impact statements beyond their completeness. The contention that the Act requires the Council on Environmental Quality to hold public hearings and approve impact statements is not supported by law. The criticism can be analogized to any type of environmental impact statement including those concerned with water use. (Barnes-Florida)

COASTAL ZONE MANAGEMENT IN MAINE: A LEGAL PERSPECTIVE,
Maine State Planning Office, Augusta. Coastal Planning Group.
H. P. Henry.
December 1973. 76 p, 307 ref, 14 photo.

Descriptors: *Maine, *Shorelines, *Comprehensive planning, *Legal aspects, *Adoption of practices, Water management(Applied), Administrative agencies, Decision making, State governments, Legislation, Planning, Water policy, Adjacent landowners, Recreation, Boating, Access routes, Economics, Fishing, Natural resources, Scenery, Tourism, Environmental effects, Water law, Ecology, Resources development, Water resources development, Resource allocation, Property values.
Identifiers: State policy, *Coastal zone management.

A general appraisal is presented of the current conditions, laws, and influences on the use of the Maine coastline, with specific recommendations for legislation to remedy present weaknesses and provide a workable framework for resource protection and conservation. The Maine legislature has expressly designated recreation as the highest and best use for the coastal areas. The effects of tourism in encouraging development and overcrowding are reviewed. To maximize public access to the beaches while minimizing the loss to adjacent landowners, an open beaches act is espoused which would require the state to maintain not only accessibility but also police protection, and conserve the beaches to preclude despoilation by the public. Emphasized is the need for comprehensive state policy and planning to integrate conservation efforts and allocate resources on other than an ad hoc basis. A systematic overview of current state environmental legislation is presented and contrasted against new requirements to bring the state within the federal Coastal Management Act requirements, which would then make available federal financial support for future programs. The analysis concludes with suggestions for a conceptual approach to coastal management and a legal and administrative framework for that management. (Salley-Florida)

WINNIPESAUKEE RIVER BASIN CONTROL.
New Hampshire Session Laws, Ch 41, Subsection 41:1-41:5, p 187-189, 1974.

Descriptors: *New Hampshire, *Governmental interrelations, *Rivers, *Administrative agencies, Administration, Legislation, Planning, Construction, Economic aspects, Government finances, Federal government, State governments, Sewage disposal, Sewage treatment, Water pollution, Treatment facilities, Pumping, Sewage districts, Sewers, Water law, Water policy, Regulation.
Identifiers: Administrative regulations, State policy, Environmental policy.

The New Hampshire water supply and pollution control commission is authorized to acquire plan, construct, and operate any and all sewage and waste disposal facilities eligible for federal and state aid. All operations will be in accordance with basin and regional treatment needs consistent with federal and state requirements. The authority to construct includes all engineering services in addition to the construction of new sewage or waste treatment plants, pumping stations, and intercepting sewers. In order to achieve reliability and efficiency the commission is authorized to locate sewer and related facilities in all public roadways, whether owned or controlled by the municipality or the state. The commission will annually assess each municipality served by the regional sewage disposal facilities a sum sufficient to recover its proportional share of the total costs. (Sperling-Florida)

DAMS AND RESERVOIRS.
Maine Legislative Service, Vol 1, Ch 787, Subsection 251-254, and 180-186, p 332-336, approved April 1, 1974 (1974).

Descriptors: *Maine, *Dams, *Reservoirs, *Regulation, *Safety, *Public health, Legislation, Wildlife conservation, Fisheries, Water quality control, Environmental sanitation, Local governments, Federal government, Administration, Adoption of practices, Water management(Applied), State governments, Administrative agencies, Legal aspects.
Identifiers: Administrative regulations, State policy.

Many dams in Maine have unknown owners. Some dams are in such a state of disrepair that they are dangerous to life and property, including wildlife, fisheries, and waters, as well as the public's health, safety, and welfare. There are people who will accept ownership of these dams, along with maintaining and repairing them. Legislation now provides that any person may petition the Soil and Water Conservation Commission to be awarded ownership of any dam, the owner of which is unknown. The Commission will give notice of the petition to the municipality in which the dam is located, and also by publication. Emergency plans and actions for the safe operation of dams and reservoirs are necessary to protect life and property. No person, except the federal government, will exercise any authority over the emergency regulation of any dams or reservoirs in the state, where such exercise would conflict with the powers and authority vested in the Bureau of Civil Defense. RIVERS, STREAMS AND BROOKS--ALTERATION.
Maine Legislative Service, Vol 1, Ch 786, secs 2206-2212, p 330-331, approved April 1, 1974 (1974).

Descriptors: *Maine, *Permits, Rivers, *Streams, *Dredging, Construction, Regulation, Legal aspects, Legislation, Adoption of practices, Administration, Water supply, Administrative agencies, Decision making, State governments, Wildlife conservation, Recreation, Navigable waters, Soil conservation, Natural flow, Water quality control, Local governments, Water quality, Pollution abatement.
Identifiers: *State policy, *Injunctive relief.

In Maine it is unlawful for any person or state agency to dredge, fill, or construct any structure in the state's rivers, streams, or brooks, without a permit. The applicant for the permit must demonstrate that the proposed activity will not interfere with existing recreational or navigational uses, cause unreasonable soil erosion, interfere with the natural flow of water, harm fish or wildlife, or lower the quality of any waters. If the water source is currently being utilized as a source of water supply by any water company or municipality, then a copy of the application for the permit should be forwarded to the company or municipality. If an application for a permit is denied the applicant may have a hearing within thirty days and within another thirty days appeal to the Superior Court. Anyone who engages in the prescribed activities without a permit will be punished with a fine of $100-$200 for each day in violation. Injunctive relief is also available to compel restoration of the affected area to its condition prior to the occurrence of the violation. (Sperling-Florida)

WATER RESOURCES (AS AMENDED).
Acts of the Kentucky General Assembly, H.B. 67, Approved March 28, 1974, effective June 21, 1974, p 480-485 (1974).

Descriptors: *Kentucky, *Legislation, *Water permits, *Administrative agencies, *Regulation, State governments, Irrigation, Water distribution(Applied), Water demand, Water supply, Industrial water, Administration, Water utilization, Water law, Water resources, Injection wells, Oil industry, Steam turbines, Water allocation(Policy), Water policy.
Identifiers: *Administrative regulations.

Kentucky legislation prohibits any person, business, or political subdivision from withdrawing or diverting public water from a stream, lake, groundwater source, or other body of water. Withdrawals and diversions have been allowed when accompanied by a permit. Permits are issued by the Department for Natural Resources and Environmental Protection, Division of Water Resources. No permit is required with the use of water for agricultural and domestic purposes. Neither will a permit be required when the amount withdrawn or diverted is less than an amount established by regulation. A permit is also not required for water used in steam generating plants or water injected underground for the production of oil and gas. All public water used pursuant to a permit must be recorded and a report submitted to the department. The willful failure to keep records shall subject the permit holder to possible revocation. (Sperling-Florida)

DEPARTMENT OF POLLUTION CONTROL AND ECOLOGY.
Arkansas Stat Ann, Vol 2, Title 5, Ch 9, sec 5-908, p 196-197 (Supp 1971).

Descriptors: *Arkansas, *Legislation, *State governments, *Environmental control, *Administrative agencies, Regulation, Administration, Water law, Water policy, Environment, Conservation, Preservation, Ecology, Control, Pollution abatement, Water pollution control, Legal aspects, Law enforcement, Governmental interrelations, Management, Non-structural alternatives, Environmental effects, Resources development, Jurisdiction, Administrative decisions.
Identifiers: Environmental policy, State policy.

There is hereby created an Arkansas Department of Pollution Control and Ecology. The head of the department shall be the Director of Pollution Control and Ecology, who shall be appointed by the Governor upon nomination by the Commission on Pollution Control and Ecology. The Director shall serve at the will of the Governor. The Pollution Control Commission and its functions, powers, and duties are transferred to the Department of Pollution Control and Ecology. There is hereby created a new Division of Environmental Preservation under this department. The new division shall be responsible for reviewing and making specific ecologically oriented recommendations on all plans, programs, and projects of all other state departments and agencies, and upon all federal actions affecting this state. The Director of the Department, with the advice and consent of the Governor, shall appoint the heads of the respective divisions. Each division shall be under the direction and control of the Director, and the Director may delegate his functions, powers, and duties to various divisions of the Department as he deems desirable. WATER MANAGEMENT DISTRICTS IN NORTH DAKOTA,
K. K. Ayers, and R. E. Beck.
North Dakota Law Review, Vol 43, p 361-381, 1972. 80 ref.

Descriptors: *North Dakota, *Legislation, *Water management(applied), *Water policy, Administrative agencies, Administration, Management, Drainage programs, Irrigation programs, Eminent domain, Jurisdiction, Water resources development, Water allocation(Policy), Watershed management, Planning, Regulation governments, Legal aspects, Water districts, Water conservation.
Identifiers: Administrative regulations, Dam effects, State policy.

Water management districts are meant to provide local guidance in dealing with the water management problems of a specific area. Their most typical problems are the removal of surplus water from agricultural lands, regulating flood waters, augmenting stream flow and constructing dams. In order to construct and maintain these projects, the water management district has the powers of eminent domain, to assess serviced property for moneys to pay for its services and to make rules and regulations concerning recreational, agricultural and industrial water use. Although water is not owned by the landowner, the North Dakota Century Code provides that the landowner receives preferential treatment in organizing or dissolving a water management district. The water management district is an adjunct to the State Water Commission, the Board of county commissioners, and the drainage districts. The latter's functions are to be absorbed into the water management district's functions. If a party is dissatified with a district's determination of the necessity of a particular project, he may contest the district's decision in a hearing before the State Water Commission. U.S. V. COLGATE-PALMOLIVE CO. (ACTION CHARGING UNLAWFUL DISCHARGE OF REFUSE MATTER INTO NAVIGABLE WATERS),
375 F. Supp. 962 (D. Kan. 1974).

Descriptors: *Water pollution sources, *Judicial decisions, *Navigable waters, *Rivers and Harbors Act, Water pollution, Industrial wastes, Waste water disposal, Waste water treatment, Sanitary engineering, Water quality, Water quality control, Rivers, Pollution abatement, Regulation, Water pollution control, Water resources development, Water law, Adjudication procedure.
Identifiers: *Notice, *Liability(Legal aspects).

A soap manufacturer was charged with unlawfully discharging refuse matter into naviagble water in violation of Rivers and Harbors Appropriation Act. Defendant's plant manufactures soap and related products, the byproducts of which are discharged untreated into the Kansas River. Defendant's were warned that the discharges were in violation of Rivers and Harbors Act and have had ample time to comply with the requirements of the statute. The defendant has filed no application for a permit to discharge wastes. The government took samples of discharged materials to determine their environmental impact. Defendant contends that it was misled by alleged government representations that the government would use the samples taken only in civil proceedings for abatement and not in criminal prosecutions. The court determined that the defendant understood that noncompliance might result in both abatement proceedings and criminal prosecution. The court held that the wastes discharged were industrial and therefore not included in the exception to the prohibition against discharges made for some domestic wastes. (Proctor-Florida)

CITY OF NEW YORK V. TRAIN (ACTION BROUGHT TO COMPEL RELEASE OF FUNDS AUTHORIZED UNDER FWPCA),
494 F.2d 1033 (D.C. Cir. 1974).

Descriptors: *Federal Water Pollution Control Act, *Allotments, *Financing, Economics, Administration, Decision making, Investigations, Judicial decisions, New York, Legislation, Adjudication procedure, Government finance, Economic aspects.
Identifiers: FWPCA Amendments of 1972, *Environmental policy.

Class action was brought by the City of New York on behalf of other municipalities against the Administrator of the Environmental Protection Agency to compel the allotments of funds authorized to be appropriated by the Federal Water Pollution Control Act. The Administrator contends that fund allotment is discretionary under the specific terms of the Act. The court examined the relevant statutory language and analyzed the pertinent legislative history in reaching a decision. It held that the specific section of the Act requires the Administrator to allot the full sums authorized to be appropriated. The decision of the trial court that the Administrator was not acting within his discretionary capacity was affirmend. (Proctor-Florida)

STATE EX REL. MCLEOD V. MURRELL'S INLET CAMP AND MARINA, INC. (QUIET TITLE ACTION INVOLVING RIPARIAN LAND),
192 S.E.2d 199 (S.C. 1972).

Descriptors: *South Carolina, *Judicial decisions, *Coastal marshes, *Land fills, *State governments, Land development, Conservation, Land management, Water management(applied), Land use, Administration, Public land, Water law, Water policy, Legal aspects.

Appellant, State of South Carolina, claims jurisdiction over low marshes or tidal marshes that are inundated twice daily. Appellee had backfilled a marsh for its own private use. Appellee contended it had the right to fill because it owned the marsh. Appellee's contention was premised on its assertion that the marsh was not inundated twice daily, but only periodically, and that appellant had no valid claim. The appellant's motion for a direct verdict was denied by the trial court and the jury held for the appellee. The trial judge had excluded from evidence two plats of appellee's property, which identified the high water mark appellant wished to prove. On appeal the South Carolina Supreme Court affirmed the denial of a directed verdict because the issue was one of fact and therefore to be decided by the jury. The court also affirmed the exclusion of the plats from evidence. Since the plats were not drawn to depict the mean high water mark and so were irrelevant, they were properly excluded from evidence. (Barnes-Florida)
W75-03704

STATE OF MINNESOTA V. ENVIRONMENTAL PROTECTION AGENCY (ACTION OF IMPOUNDMENT OF FWPCA FUNDS),
1 Pollution Control Guide, Vol 3, paragraph 15011, p 15122-15129, 1973.

Descriptors: *Judicial decisions, *Government finance, *Jurisdiction, *Administrative agencies, Administration, Budget, Economic aspects, Federal Water Pollution Control Act, Sewerage, Treatment facilities, Waste water treatment, fFederal government, *Minnesota, Legal aspects, Adjudication procedure.
Identifiers: *Sovereign immunity, Impoundment(Legal aspects), Administrative regulations, FWPCA Amendments of 1972.

A federal district court in Minnesota held that the Environmental Protection Agency Administrator is required under the 1972 Amendments to the Federal Water Pollution Control Act to allot all sums Congress authorized to be appropriated, thereby making sums available for sewage treatment works construction approved for federal funding. The court explained whatever discretionary control over the funding of such projects the administrator may have is circumscribed by statutory language. The doctrine of sovereign im-

munity does not bar the court from having jurisdiction where the allegation is that the administrator acted beyond the scope of his authority. In an action for declaratory and injunctive relief, the constitutional requirement of a justiciable case or controversy proscribes hypothetical or political questions. By refusing to make a full allotment of Minnesota sewage treatment construction projects injuries are produced which are sufficiently concrete and interests are created sufficiently adverse to create a justiciable controversy. (Sperling-Florida)

KENTUCKY POLLUTION ABATEMENT AUTHORITY,
Acts of the Kentucky General Assembly, H.B. 560, Approved March 28, 1974, Effective June 21, 1974, p 552-556, 1974.

Descriptors: *Kentucky, *Legislation, *Treatment facilities, *Construction, *Government finance, Waste water treatment, Water pollution control, Economic aspects, Federal government, Administrative agencies, Administration, Public health, Safety, Water resources, Adoption of practices, Water resources development, State governments, Waste treatment, Treatment facilities, Grants, Cost-sharing, Costs.
Identifiers: Administrative regulations, State policy.

The pollution of Kentucky's water resources has endangered the public's health and safety. To preserve the natural water resources, and the economic potential of the state, the state should assist governmental agencies so that waste water treatment works may be constructed. Federal law providing for grants for waste water treatment works provides that in order to obtain maximum federal grant participation, a state must also furnish some aid. Without state aid, governmental agencies undertaking construction of waste water treatment works in the state must receive a smaller proportion of the necessary costs from the federal government. The Kentucky Pollution Abatement Authority will make the grants in a manner calculated to maximize the total amounts of federal grant participation received, or to be received. All governmental agencies are given power to undertake eligible projects, and to apply and receive state and federal grants. (Sperling-Florida)
W75-03707

INTERSTATE MINING COMPACT (AS AMENDED),
Acts of Indiana, Public Law No 51, S. 65, Approved Feb. 12, 1974, Ch. 212, p 214-223, 1974.

Descriptors: *Mining, *Indiana, *Legislation, *Water quality control, *Interstate compacts, State governments, Water pollution sources, Public health, Safety, Mine wastes, Economic, Aspects, Water resources, Water pollution coordination, Soil structure, Standards, Water resources development, Interstate waters, Pollution abatement, Water law, Water policy.
Identifiers: State policy, Environmental policy.

The effects of mining on the availability of water and other resources for other uses present problems which can properly be approached by considering the interests of those engaged in mining, those proposing to use these resources for other purposes, and the public. Variables such as soil structure and composition, physiography, climate, and the needs of the public make impracticable the application to all mining areas of a single standard. The state of Indiana has joined this interstate compact to advance the protection and restoration of water and other resources affected by mining. Other states will be assisted in their efforts to facilitate the use of resources affected by mining so that such use may be consistent with sound land use, public health, and safety. Assistance will also be given in the form of studies and recommendations, and techniques for the improvement, restoration or protection of water and other resources. (Sperling-Florida)
W75-03708

ENVIRONMENTAL PROTECTION ACT (AS AMENDED),
Acts of the Kentucky General Assembly, S.B. 242, Approved March 29, 1974, Effective June 21, 1974, p 445-449, 1974.

Descriptors: *Kentucky, *Legislation, *Planning, *Environmental sanitation, *Environmental effects, Cost-benefit analysis, Water resources, Water allocation(Policy), Water requirements, Water pollution sources, Pesticides, Water quality control, Radioactivity, Thermal pollution, Pollution abatement, Government finance, Monitoring, Federal government, State governments, Administrative agencies, Water resources development, Water quality control.
Identifiers: State policy, Environmental policy, Administrative regulations.

The Kentucky Department of Environmental Protection (DEP) has the authority to develop a comprehensive plan related to the environment. Development which provides the best usage of land areas, maximizes environmental benefits, and minimizes the undesirable environmental effects will be encouraged. A program will be developed for the management of water resources to assure their protection, and to balance their utilization. The Department will provide guidelines for the prevention, abatement, and control of all water pollution including particulates, pesticides, radiation, and heated liquids. The DEP also has the power to administer grants of other funds or gifts from public and provate agencies including the federal government for the purpose of carrying out any functions of the department. The environment will be monitored to afford more effective and efficient control practices, to identify changes and conditions in ecological systems, and to warn of emergency conditions. (Sperling-Florida)

COMMITTEE FOR THE CONSIDERATION OF THE JONES FALLS SEWAGE SYSTEM V. TRAIN (ACTION SEEKING INJUNCTIVE RELIEF RESTRAINING THE GRANTING OF SEWER HOOK-UP PERMITS),
375 F. Supp. 1148 (D. Maryland 1974).

Descriptors: *Water pollution sources, *Sewage, *Sanitary engineering, *Sewage effluents, Sewage treatment, Water pollution, Sewage disposal, Waste water disposal, Judicial decisions, Water quality, Water quality control, Water law, Water resources development, Adjudication procedure, treatment facilities, Federal Water Pollution Control Act.
Identifiers: *Injunction, *Nuisance(Lega aspects), FWPCA Amendments of 1972, *Immunity(Legal aspects), Private interest groups.

Action was brought by individuals and citizens associations for injunctive relief to restrain defendant city and Environmental Protection Agency (EPA) from granting permits for sewer hookups into the sewer system and requiring them to revoke certain existing hookup permits. Plaintiffs also sought an order to compel the Administrator of the EPA to require the owner or operator of any point source to maintain records, sample effluents, and provide other information in accordance with the Federal Water Pollution Control Act Amendments of 1972. The defendants, a private citizen and the Mayor and City Council of Baltimore submitted a motion to dismiss the complaint. The District Court held that the discharge permit application filed by the city for the waste water treatment plant included the sanitary sewer system and pumping stations for the purposes of the statute granting immunity from suit. The Court further held that the cause of action for public nuisance would not extend to private plaintiffs. The plaintiffs would be allowed to amend the complaint to assert that discharges constituted an eminent danger to the health of persons under the FWPCA. (Proctor-Florida)

YONGE V. ASKEW (CERTIORARI TO REVIEW DENIAL OF APPLICATION TO DREDGE NAVIGABLE WATERS),
293 So. 2d 395 (Fla. App. 1974).

Descriptors: *Florida, *Judicial decisions, *Dredging, *Permits, *Legal review, Administrative agencies, Environmental effects, Water resources development, Navigation, Rivers, Water law, Legal aspects, Riparian rights, Water policy, Preservation, Water management(Applied), Land tenure, Water rights, Water utilization, State jurisdiction, Control, Adjudication procedure, Regulation, Environmental control, Governments, Adoption of practices.
Identifiers: Administrative regulations, Declaratory judgements, Environmental policy.

Petitioner landowner brought action seeking a writ of certiorari to review an order rendered by a state administrative agency, the trustees of which are respondents herein. The order denied petitioner's request for a permit to dredge three navigational connections into the Crystal River. The connections were part of petitioner's plans for development of 700 acres of uplands owned by the petitioner. The petitioner contended that the application met all requirements of law and therefore the respondents were mandatorily required to issue the permit as a ministerial duty. In the alternative, the petitioners contended that the respondents' refusal to grant the permit was an abuse of discretion in that it was unsupportable by any competent or substantial evidence. The First District Court of Appeal ruled that the order rendered by the respondent was not subject to judicial review under the Administrative Procedure Act. In addition, the court ruled that the issuance of the permit was not a ministerial duty and that the petitioner had failed to meet its burden of showing that the works requested were in the public interest. Thus the denial was not an abuse of discretionary power. Certiorari was denied and petitioned dismissed. (Deckert-Florida)
W75-03711

JONES V. SCOTT (ACTION CLAIMING PRESCRIPTIVE RIGHT IN PUBLIC OVER NAVIGABLE WATER).
509 S. W. 2d 831 (Sup. Ct. Ark. 1974).

Descriptors: *Arkansas, *Judicial decisions, *Prescriptive rights, *Public access, Water law, Land tenure, Legal aspects, State jurisdiction, Legal review, Public rights, Easements, Real property, Common law, Equity, Recreation, Navigable waters, Right-of-way, Adjudication procedure, Public rights.
Identifiers: *Water rights(Non-riparians), *Public trust doctrine.

Plaintiffs, appellees in this action, brought su against the defendant landowner claimi prescriptive rights in public with respect to the u of a gravel bar outside a 30-foot right-of-way. T gravel bar had been used for more than 30 yea for launching of boats, fishing, camping and oth activities. Such use had continued until recent when defendant had erected a fence. The defe dant contended that the use of the land had be permissive and not adverse. The trial court fou no prescriptive right to camp, picnic, or fish, b did find a prescriptive right to launch boats. On a peal, the Supreme Court of Arkansas reversed t lower court and ruled that the evidence tended show all use to be permissive on the part of t landowner and not of such frequency that owner would be presumed to know that such us was adverse. The court also ruled that

vidence failed to establish the navigability of the iver and that a flowage easement obtained by the overnment in connection with construction of a am did not give the public any right to use the nd. (Deckert-Florida)

WATER QUALITY MANGEMENT PLANS--PROPOSED RULES.
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol 38, No 99, p 13567-13571, May 23, 1973.

Descriptors: *Federal Water Pollution Control Act, *Regulation, *Planning, *State governments, *Adoption of practices, Federal government, Administrative agencies, Administration, Coordination, Decision making, Water quality control, Treatment facilities, Natural resources, Standards, Water resources, Water pollution control, Water management(Applied), Water conservation, Water utilization, Water treatment, Water allocation(Policy).
Identifiers: *Administrative regulations, *Effluent limitations.

The Environmental Protection Agency has proposed regulations designed to assist the states in the preparation of water management plans. The Federal Water Pollution Control Act requires each state to have a continuing planning process for pollution control. The purpose of preparing basin plans is to provide the information which the states will need to make centralized coordinated water quality management decisions. Another purpose is to encourage adoption of water quality objectives which take into account overall state policies and programs, including those for land use and other related natural resources. The regulations describe the preparation of plans and the procedures governing plan adoption, submission, revision, and approval. The relationship of plans with agency grants and the national permit system is also described. Water quality will be classified according to the severity of the pollution. Federal properties, facilities, and activities are subject to federal, state, interstate, and local standards and effluent limitations for control and abatement of pollution. (Sperling-Florida)
W75-03718

BEAUNIT V. ALABAMA POWER CO. (ACTION AGAINST CORPORATION FOR LOWERING RIVER LEVEL BY DAM).
370 F. Supp. 1044 (D.C. N.D. Ala. 1974).

Descriptors: *Alabama, *Judicial decisions, *Relative rights, *Natural flow doctrine, *Reasonable use, Land tenure, Federal jurisdiction, Discharge(Water), Water consumption, Water management(Applied), Water rights, Water law, Legal aspects, Riparian rights, Regulated flow, Water allocation(Policy), Water utilization, Rivers, Water quality control, Alteration of flow, Competing uses, Hydroelectric power, Adjudication procedure.
Identifiers: Nuisance(Legal aspects), Statute of limitations, Dam effects.

Plaintiff lower riparian landowner sued defendant public utility for certain alleged property damage suffered by the plaintiff due to the defendant's operation of an upstream dam as a peaking power plant. The defendant's operation of the dam resulted in a decreased flow of water past the plaintiff's property. The plaintiff contended that Alabama recognized his riparian right in the continuous and uninterrupted flow of the river, and that the defendant was therefore liable for certain damages incurred by the plaintiff as a result of the decreased flow. The United States District Court disagreed, stating that the plaintiff would have a cause of action only if the defendant had been negligent in the operation of its dam or if such operation was not a 'reasonable use' of the river. The court found that the defendant's use of the river incident to its operation of the dam and generating facilities was a reasonable exercise of its riparian rights, and ruled that the plaintiff's cause of action for nuisance accrued more than one year before commencement of this action, and therefore was barred by the statute of limitations. (Deckert-Florida)

GULF OIL CORPORATION, ET AL. V. MORTON (ACTION FOR WRIT OF MANDAMUS).
1 Pollution Control Guide, Vol 3, paragraph 15026, p 15232-15238, 1974.

Descriptors: *Leases, *Judicial decisions, *Legal review, *Water pollution sources, Decision making, Oil industry, Legislation, Drilling, Exploration, United States, Administrative agencies, Administration, Environmental effects, Continental shelf, Adoption of practices, Standards, Water pollution, Legal aspects, Administrative decisions, Water quality standards, Federal government, Exploitation.
Identifiers: *Administrative regulations.

A suit asked the court to declare invalid the Secretary of the Interior's order which suspended exploration and drilling operations on leaseswhich permit the recovery of mineral resources from the Outer Continental Shelf. The Secretary has the power to suspend operations under existing leases whenever he determines that the risk to the marine environment outweighs the immediate national interest in exploring and drilling for oil and gas. The scope of review requires an inquiry which identifies the range of choices available to an administrative official and which determines whether on the facts the official's decision falls within that

range. In this case drilling had not yet begun so the Secretary asked Congress to terminate certain leases and require their abandonment. A United States Geological Survey report indicated that the environmental risks involved in continued operation were unacceptable since the operations were subject to abandonment in the near future. The court held the Secretary's actions valid and in accordance with law. (Sperling-Florida)
W75-03721

GROUNDWATER USE ACT OF 1972.
Code of Georgia Annotated, Title 17, Ch 17-11, secs 17-510 thru 17-521.2, p 21-31 (Supp 1972).

Descriptors: *Georgia, *Legislation, *Water resources, *Regulation, *Planning, Water supply, Water resources development, Waterutilization, Water requirements, Conservation, Groundwater, Sea water, Water demand, Administrative agencies, Adoption of practices, Pumping, Wells, Aquifers, Permit, Aquifer management, Water supply development, Water conservation, Environmental control.
Identifiers: *Environmental policy, *Administrative regulations.

The water resources of the state of Georgia should be put to beneficial use to fullest extent possible, subject to reasonable regulation. This regulation will be aimed at conserving these resources and to provide and maintain conditions which are conducive to the development and use of water resources. The Environmental Protection Division of the Department of Natural Resources will prepare proposed regulations concerning the use of groundwaters. Water users will submit reports concerning the quality of water used, the sources of water, and the nature of the use. Provisions will be made to protect against or abate saltwater encroachment, as well as adverse effects on other water users. Regulations concerning well depth, pumping levels, and pumping rates in wells or aquifers will be promulgated. Permits will be required for the use of groundwater in excess of 100,000 gallons per day. Procedures for obtaining the permit from the division, and the criteria the division should consider are described. (Sperling-Florida)
W75-03722

U.S. V. CAPPAERT (ACTION BY U.S. TO HAVE ITS RIGHTS TO USE OF APPURTENANT WATERS DECLARED).
375 F Supp 456 (D Nev 1974).

Descriptors: *Nevada, *Fish, *Wildlife, *Fish conservation, *Fish populations, Judicial decisions, Wildlife conservation, Fish management, Water loss, Water management(Applied), Legal aspects, Landowners, Jurisdiction, Public rights, Water law, Water resources development, Parks, National parks, Recreation facilities, Conservation, Natural resources, Federal government, Adjudication procedure, Appropriation, Groundwater mining, Groundwater potential, Preservation.
Identifiers: Environmental policy, Water rights(Non-riparians).

Action was brought by the United States to have its rights declared to use the waters appurtenant to land known as Devil's Hole, Death Valley National Monument, to the extent that it is necessary to maintain a pool and the desert pupfish therein. The government also seeks an injunction restraining landowners from pumping water except for domestic purposes. The plaintiff alleges that this excess pumping is detrimental to the water rights of the public and the survival of the pupfish. The defendants own lands and claim the water rights within the area near Devil's Hole, which claimed rights conflict with the claimed rights of the United States. The Federal District Court held that the patents to which the defendants trace their ownership to the lands surrounding the hole passed title to the land, but U.S. title is superior in time and right. It further held that the defendants' pumping underground water had drawn water from underground sources which supplied Devil's Hole. This action threatened the survival of the pupfish. Since the public had an interest in protecting this endangered species, an injunction was granted. (Sperling-Florida)
W75-03723

TAXATION--EXEMPTION--PROPERTY USED FOR POLLUTION CONTROL OR WATER IMPOUNDMENT.
Iowa Legislative Service, Senate File 321, Vol 3, p 660-662, approved June 3, 1974 (1974).

Descriptors: *Iowa, *Legislation, *Impoundments, *Taxes, *Tax rates, *Assessments, *Water pollution, Treatment facilities, Water storage, Water pollution control, Permits, Adoption of practices, Administration, Regulation, Economic aspects, Water pollution control, Water treatment, Abatement, Water quality, Water quality control, Pollution abatement, Economics, Legal aspects.
Identifiers: State policy, Administrative regulations.

A limited exemption from property taxation for property used to control air or water pollution and an exemption for certain property used for water impoundments are provided. The exemptions apply to new installations of pollution control property for a period of ten years beginning on January first after the construction of installation of the property is completed. The exemption will apply with respect to each of the ten annual assessments within the ten year exemption period and the property taxes payable on the basis of each of such ten annual assessments. This exemption is limited to the market value of the pollution control property. If the pollution control property is assessed with other property as a unit, this exemption is limited to the net market value added by the pollution control property. Exemptions for impoundment structures and underlying land are available on application which will include a copy of the water storage permit approved by the water commissioner of the Iowa natural resources council. (Sperling-Florida)
W75-03724

ILLINOIS AND MICHIGAN CANAL.
Smith-Hurd Annotated (Illinois), Ch 19, secs 8-47e, p 5-14, Supp 1972.

Descriptors: *Illinois, *Canals, *Legislation, *Administrative agencies, *Michigan, Basins, Dams, Navigation, Adoption of practices, Regulation, Decision making, State governments, Legal aspects, Water power, Leases, Construction, Water rights, Cost-benefit analysis, Governmental interrelations, Water law, Water management(Applied), Water resources development, Economic aspects, Interstate.
Identifiers: Administrative regulations, State policy.

The Illinois Department of Conservation has control and management of the Illinois and Michigan canal including feeders, basins, appurtenances, and locks, dams, and other improvements for navigation. The Department can prescribe reasonable rules and regulations in respect to all matters connected with the navigation and use of the canal, locks and dams, as well as traffic through them. The Department will establish reasonable toll rates for passage. The Department can lease to the highest bidder any water power and lands connected with the canal. No lease shall be for more than twenty years. All leases of water power are subject to the right of the Department to resume, without compensation to the lesee, the use of any such water power for the purpose of the canal. Also, the work by the construction of which created the water privilege may be abandoned or destroyed, whenever such work in the opinion of the legislature is no longer advantageous to the State. (Sperling-Florida)
W75-03725

WATER RECREATION ACT OF 1973.
Code of Georgia Annotated, Title 17, Ch 17-21, secs 17-1201 thru 17-1205, p 31-32 (Supp 1973).

Descriptors: *Recreation, *Water resources, *Georgia, *Legislation, Regulation, Natural resources, Water demand, Adoption of practices, Decision making, Administration, Economic aspects, Administrative agencies, Lakes, Watercourses, Legal aspects, Water resources development, Water management(Applied), Administrative decisions.
Identifiers: Administrative regulations, State policy, Liability(Legal aspects), Environmental policy.

Massive water-related recreational events may cause considerable damages to natural resources if improperly handled. The increasing popularity of water related recreation will cause in increase in the number and intensity of such events. A person sponsoring a water event in Georgia is to provide a bond. A water event is one that is advertised and likely to attract over five thousand people onto state waters other than lakes. The bond is to be provided to the Georgia Department of Natural Resources, not exceeding ten thousand dollars, issued by a surety company authorized to do business in the state. The Department is to be the sole judge as to the performance. All existing rights to bring a civil action for damages to person or property remain intact. (Sperling-Florida)
W75-03726

UNITED STATES V. REPUBLIC STEEL CORP. (REFUSE DISCHARGE INTO NAVIGABLE WATERS).
1 Pollution Control Guide (Vol 3) paragraph 15034, p 15280-15282, 1974.

Descriptors: *Legal aspects, *Federal Water Pollution Control Act, *Rivers and Harbors Act, *Oil wastes, *Judicial decisions, Ohio, United States, Navigable waters, Adoption of practices, Administrative agencies, Water pollution control, Waste water disposal, Water pollution sources, Rivers, Water quality control, Industrial waste, Adjudication procedure, Legislation, Pollution abatement, Water policy.
Identifiers: Notice, Environmental policy, Refuse Act of 1899, Evidence.

The U.S. Sixth Circuit Court of Appeals recently affirmed the U.S. District for the Northern District of Ohio, holding that a corporation giving immediate notice to an agency of the federal government of a discharge of oil into navigable waters cannot be prosecuted by the use of such information. This use of information was precluded by provision of the Federal Water Pollution Control Act. The purpose of the provision is to control water pollution by requiring immediate reporting of discharges of oil, and to provide an incentive for such reporting. The language of the Act was construed as protecting corporations as well as natural persons. A steel company had dumped coal tar into the Mahoning River. This was a violation of a provision of the Rivers and Harbors Act of 1899 which makes it unlawful to discharge any refuse matter of any kind into navigable waters of the United States. The Court granted the company's motion to suppress the notice it had sent to the Coast Guard informing the government of the discharge. The notice by the company was the only evidence of violation. (Sperling-Florida)
W75-03727

POLLUTANT SPILL PREVENTION AND CONTROL ACT (AS AMENDED).
Florida Sess Laws, Vol 4, Ch 74-336, p 812-822, approved June 27, 1974, effective July 1, 1974 (1974).

Descriptors: *Water pollution, *Water pollution sources, *Oil pollution, *Legislation, *Florida, Public health, Social aspects, Ships, Enforcement, Regulations, Legal aspects, Governments, Pollution abatement, Environmental effects, Pollution taxes(Charges), Water quality control, Water quality standards, State governments.
Identifiers: Coastal waters, Coastal zone management, State policy, Environmental policy, Liability(Legal aspects), Effluent charges.

The act provides for the prevention and control of the discharge of pollutants in Florida. The legislature finds that the transfer of pollutants between vessels, between onshore facilities and vessels, and between offshore facilities and vessels is hazardous. The policy is to preserve the public use of navigable waters and to promote the general health, safety, and welfare. Provisions require registration certificates for all terminal facilities. The Department of Natural Resources is empowered to adopt and enforce regulations relating to the discharge of pollution into state waters and onto state coasts. Any person discharging effluents shall remove the pollutant. In the alternative, provisions for a department cleanup exist. A fund is established to provide monies for cleanup and rehabilitation after a pollutant has been discharged. An excise tax upon terminal facilities shall be levied to help maintain the fund. Any vessel or its agents which permits or suffers a prohibited discharge within state jurisdiction shall be liable to the fund for cleanup costs up to a fixed limit. Enforcement and penalties for violators are set forth. (Proctor-Florida)
W75-03728

PORT AUTHORITIES--ESTABLISHMENT.
Missouri Leg Service, Vol 2, Act 88, HB No 1646, p 227-231, approved June 18, 1974 (1974).

Descriptors: *Missouri, *Legislation, *Port authorities, *Adoption of practices, *Administration, Legal aspects, Rivers, Economic aspects, Government finance, Kansas, Boundaries(Property), Navigable waters, State governments, Administrative agencies, Political aspects, Local governments, Governmental interrelations, Standards, Water law, Economic aspects, Regulation, Interstate waters.
Identifiers: State policy.

The state of Missouri has authorized each city or county which has within its boundaries a navigable waterway to form a port authority. Upon the approval of the Director of the Transportation Commission of Missouri, the port authority will become a political subdivision of the state government. The Director is authorized to accept applications, conduct hearings, and approve or disapprove applications for creating city or county port authorities. Various criteria to be considered in passing upon the application are set out. Included in the criteria are: the population of the city or county submitting the application; the desirability or economic feasibility of having more than one authority in the same area; technical and economic capability to carry out port development; and the actual and potential river traffic and economic impact. Any application will be granted if the subdivision has a 300,000 population and a common boundary with the state of Kansas. (Sperling-Florida)
W75-03729

INLAND LAKES PROTECTION AND REHABILITATION.
Wisconsin Legis Service, Vol 2, Ch 301, AB 766, p 344-355, effective June 19, 1974 (1973).

Descriptors: *Lakes, *Eutrophication, *Planning, *Wisconsin, *Economic aspects, Recreation, Aesthetics, Environmental sanitation, Wildlife conservation, Public health, Water pollution, Water quality control, State governments, Local governments, Government finance, Water resources, Water law, Administration, Legislation, Water resources development, Surface waters, Water pollution control, Abatement.
Identifiers: State policy.

Environmental values, wildlife, public rights in navigable waters, and the public welfare are threatened by the deterioration of natural lakes. The current state effort in Wisconsin to abate water pollution will not undo the eutrophic and other deteriorated conditions of many lakes. Lakes form an important basis for the state's recreation industry. The increasing recreational usage of the waters of this state justifies state action to enhance and restore the potential of the inland lakes. A state effort of research, analysis, planning, and financing, and a local effort undertaken by lake rehabilitation and protection districts of planning and plan implementation is necessary. The local districts will be formed by persons directly affected by the deteriorated condition of inland waters and willing to assist financially, or through other means, in remedying lake problems. (Sperling-Florida)
W75-03730

POLLUTION CONTROL AWARDS PROGRAM.
Florida Sess Laws, Vol 1, Ch 74-60, p 64-65, app May 22, 1974, effective-immediately (1974).

Descriptors: *Pollution abatement, *Air pollution, *Water pollution control, *State governments, Environmental sanitation, *Water law, Environmental quality, Legislation, *Florida, Administration, Social aspects, Aesthetics, Water resources development, Political aspects, Water policy.
Identifiers: Environmental policy, State policy.

A pollution control awards program is established to be administered by the Florida Department of Commerce. Awards may be granted to governmental or private entities for efforts in preventing or cleaning up of pollution as provided by the rules promulgated by the Department of Commerce. Special awards may be given for outstanding effort and achievements in these endeavors. Awards or special awards may be presented in the categories of water pollution, air pollution, noise pollution and communication media on pollution problems. (Proctor-Florida)

CLIO NODS: ARIZONA V. CALIFORNIA AND THE BOULDER CANYON ACT - A REASSESSMENT,
California Univ., Los Angeles. Dept. of History.
N. Hundley, Jr.
The Western Historical Quarterly, Vol III, No 1, p 17-51, January 1972, (California Water Resources Center Project UCAL-WRC-W-145).

Descriptors: *Water rights, *Federal-State Water Rights Conflicts, *Legal aspects, Streamflow, *Arizona, *California, *Interstate rivers.
Identifiers: *Boulder Canyon(Ariz-Calif).

The Boulder Canyon Project Act of 1928 is reviewed in the light of implications of the decision in Arizona v. California, 373 U. S. 546 (1963). The decision increased the power of the federal government by declaring that Congress could divide the waters of interstate streams. The implications of this effect--and the possible misinterpretations that might have led to what may be a faulty conclusion--are reviewed. Whereas it has been generally believed that Arizona v. California has resolved and settled most of the conflict issues, it is suggested that possible misinterpretations of the original 1928 Act may lead to continued conflict and court actions. COSTS - EXERCISING EQUITABLE POWERS TO AWARD ATTORNEY'S FEES TO LOSING PARTY SEEKING COMPLIANCE WITH THE NATIONAL ENVIRONMENTAL POLICY ACT. SIERRA CLUB V. LYNN, 364 F. SUPP. 834 (W.D. TEX. 1973),
G. Zunker.
Land and Water Law Review, Vol 9, No 2, p 553-563, 1974.

Descriptors: Legal aspects, *Texas, Legislation, *Costs, Environment.
Identifiers: *Environmental impact statements, *National Environmental Policy Act.

A recent federal district court case in Texas resulted in allowing a plaintiff who unsuccessfully challenged environmental impact statements prepared by the Department of Housing and Urban Development (HUD) for a housing development to recover his costs of litigation, including attorney fees. This holding is contrary to the general rule under which courts neither award attorneys' fees as a part of costs to the prevailing party, nor permit direct recovery of which fees as a part of damages. The allowance of such fees in Sierra Club v. Lynn was based upon recognized exceptions to the general rule due to the fact that the plaintiff in the case was acting as a 'private attorney general' in seeking compliance with the National Environmental Policy Act and that there were overriding circumstances in view of the fact that the suit, although unsuccessful, encouraged remedial action by HUD and served to educate the public to the environmental implications of the proposed project. The court's holding is criticized in that the costs are awarded against the private land developer rather than HUD which is charged with statutory responsibility for the preparation of environmental impact statements. The statute barring such recovery from HUD is viewed an an impediment to the internalization of social and economic costs generated by the inadequate studies originally made by HUD.

AMES RESERVOIR ENVIRONMENTAL STUDY, APPENDIX 1. NATURAL AND ARCHAEOLOGICAL RESOURCES OF THE RESERVOIR SITE AND STREAM SYSTEM.
Iowa State Water Resources Research Inst., Ames; and Iowa State Univ., Ames. Engineering Research Inst.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 623, $10.00 in paper copy, $2.25 in microfiche. Vol 1, 343 p, 1973. OWRT A-999-IA(8a). DACW25-72-C-0033.

Descriptors: *Land management, *Recreation, *Iowa, Planning, *Land use, Environmental effects, Aesthetics, *Landscaping.
Identifiers: *Ames Reservoir(Ia), Resource design.

A landscape overview of Iowa's Ames Reservoir site is presented in this report, one of several evaluating the social, economic and environmental impacts of the proposed reservoir. The first phase of the landscape overview was a visual analysis. The reservoir study was interpreted photographically and by artists' sketches to show potential changes brought about by alternative reservoir configurations. In the second phase a computer bank of resource information pertinent to the project area was created. The data was programmed in computer graphics or tabular form to enable researchers to quantify and qualify patterns of resource changes resulting from the proposed project. The third phase utilizes the accumulated resource information to illustrate patterns of land types for various reservoir associated uses. The fourth phase was to quantify changes in timber resources associated with alternative reservoir designs. Results of the study indicate that the 34 section study area contains 25% of the county's natural woodland. The proposed reservoir pool will inundate 15% of the county's natural woodland and 1.2% of the county's land area. The proposed landscapes would afford greater opportunity to recreate through more physical activities then are afforded now; but would yield a less diverse range of activities. Delaware Univ., Newark. Academy of Natural Sciences; and Rutgers - the State Univ., New Brunswick, N.J. Work Group on Economic and Social Problems of the Delaware Estuary Region.
P. G. Gosselink.
Report to NSF RANN Program, September 1973. 42 p, 2 fig, 24 tab, 13 ref.

Descriptors: *Rivers, *Delaware River, Water resources development, Planning, Recreation, Basins, *Water quality, *Estuaries, Delaware, New Jersey, Pennsylvania, New York.

Several social, economic, and environmental relationships are explored for the Delaware River basin. Secondary data is utilized to identify existing conditions and trends and future research needs. The basin extends from Capes May and Henlopen to the Trenton, N.J., tidewaters. A review of natural characteristics and land use indicate basin landscapes are primarily composed of rolling hills and undulated lands. Nearly 50% of the total land area was in forest, 22% in cropland, and 10% in urban uses. Economic projections forecast that the basin's population and employment will double over the 1955-2010 period, with personal income quadrupling. The basin's ports also handled over 116,000,000 short tons of sea commerce in 1968. River quality varies with industrial effluents and oil releases from vessels and the surrounding seven refineries that contribute to the degradation. The basin provides over 137,000 acres of recreational land and water to service over 25 million recreationalists. Growing demand and already overtaxed facilities suggest the need for expansion. Design and cost configurations are projected to meet this demand under three alternative developmental goals. Social, economic, and environmental impacts of port development and electric plants addition are also noted. (Schroeder-Wisconsin)

ENVIRONMENTAL POLLUTION IN A RAPIDLY GROWING ECONOMY,
Y. Iwata.
The Developing Economies, Vol 10, No 4, December 1972. p 479-495, 3 fig, 4 tab, 9 ref.

Descriptors: *Economic impact, *Environmental effects, *Pollution abatement, Industrial wastes, Industrial production.
Identifiers: *Japan.

Environmental pollution in Japan has undergone radical changes since 1955. Pollution has come to affect increasingly greater areas and is causing damage not only to property, but to humans as well. Damage is no longer confined to direct injuries; secondary and tertiary damage in ecological terms have become increasingly important. Finally, pollution is viewed as a serious economic problem because of the rapidly rising social costs of environmental degradation. A number of factors have been associated with the rapid spread and rising complexity of environmental deterioration and resultant economic burdens in Japan since 1965: (1) increasing congestion in the Japanese economy; (2) shifts in Japan's industrial structures to often more pollution prone industries; (3) greater sophistication of consumption resulting in greater refuse and (4) inadequate investments in social overhead capital. Projections for 1985 estimate that if trends continue, sulfate oxides, BOD and refuse levels will grow from 400,000 to 16,811,000 (1955-85) 543,000 to 16,977,000 (1955-85) and 24.9 to 78.9 million (1965-85) tons respectively. Greater pollution standards may lead to shifts in the industrial structure with machinery manufacturing increasing and oil refining and pulp industries declining. (Schroeder-Wisconsin)

EVACUATION RISKS - AN EVALUATION,
National Environmental Research Center, Las Vegas, Nev.
J. M. Hans, Jr., and T. C. Sell.
Report No EPA-520/6-74-002, June 1974. 166 p, 1 fig, 16 tab, 52 ref, 1 biblio, 8 append.

Descriptors: *Accidents, *Damages, *Hazards, *Civil defense, *Radiation, Radioactivity, *Radioactivity effects, Lethal limit, Public health, Safety, Risks, Disasters, Evaluation, Population, Costs, Air pollution, Water pollution, Water pollution sources, Nuclear energy, Benefit-cost theory.

A study was conducted to assess the risk of death, injury, and cost associated with an evacuation of population groups affected by an incident at a fixed nuclear facility. Data and information were obtained by contacting persons and organizations involved with previous evacuations precipitated by natural or man-made causes and from available literature. Frequencies of 8.9 times 10 to the minus 8th power deaths per person-mile and 4.4 times 10 to the minus 8th power injuries per person-mile were derived from data representing vehicle evacuations involving approximately 5.5 times 100,000 persons. National Safety Council (NSC) data for motor vehicle accidents indicate frequencies of 2.4 times 10 to the minus 8th power deaths per person-mile and 9.0 times 10 to the minus 7th power injuries per person-mile. Because of the small number of deaths and injuries derived from the study of evacuations, no statistical comparison with NSC information could be made; however, strong subjective information suggests that NSC data can be used for estimating the risk of injury or death. Identifiers: *Delaware Estuary, *Philadelphia(Pa), Trenton(Del), Wilmington(Del).

Important marshlands in the Delaware Estuary are described in terms of their common emergent vegetation. Human activities that might disturb these marshes are also identified. Aquatic life in each marsh area was examined to determine the kinds of aquatic communities supported and disturbed. Throughout the upper part of the estuary, extending from Trenton to Wilmington, the emerging vegetation is characteristic of freshwater marshland. Examination of aquatic life in the upper estuary produced evidence of organic enrichment, and there were also indications of toxic pollution and/or periods of low dissolved oxygen concentration, evidenced by reduction in numbers of fish in upper estuarine waters. Effects of thermal pollution have not been identified yet. On the seaward side, aquatic flora and fauna approached more natural conditions, but there were sites showing pollution effects from sewage treatment plants, landfills, or industry. However, these impacts are local, not widespread. The upper part of the estuary is the severely impacted zone, with degradation greatest near Philadelphia. While natural marshland has been eliminated in the upper reaches, large natural marshes still support flora and fauna in the lower estuary. (See also W75-03440) (Grden-North Carolina)

LEGAL AND ECOLOGICAL ASPECTS OF THE INTERNATIONAL ENERGY SITUATION,
Department of State, Washington, D.C.
J. D. Muir.
International Lawyer, Vol 8, No 1, p 1-10, January 1974. 16 ref.

Descriptors: *Pollution sources, *Energy production, *Energy consumption, *Oil resources, *Environmental effects, *Natural resources, Environment, Technical problems, Radiation, Thermal energy, Environmental impact, Oil pollution, Federal Quality Control Act, Legislation, Jurisdiction, Adoption of practices, Nuclear energy, Breeder reactors, Social benefits, Natural resources, Legal aspects, Oceans, Water resources development, Water law, Water policy, International law.
Identifiers: *International agreements, *Territorial waters.

The current energy situation is to a considerable degree the result of increases in consumption and inclusion of ecological considerations in policy making. Production and consumption of energy are major sources of pollution. The increased consumption now projected for the immediate future will increase the incidence and magnitude of these environmental problems. Conflicts between environmentalists and industrialists over increased energy needs and environmental restrictions have spawned tension. The United States is increasing its dependence on foreign oil and this creates problems requiring international solutions. As oil prices rise, demands for increased use of coal, which is a major source of pollution, are heard. The development of nuclear energy for commercial use has also encountered environmental and technical problems relating to radiation release. It is hoped that the development of fusion technology will permit the use of seawater as an energy source. Considerable law has developed with respect to ecological considerations affecting neighboring countries, including liability for oil pollution damage. These developments are in addition to actions taken by state and federal jurisdictions in the United States through the Federal Water Quality Improvement Act. (Sperling-Florida)

Descriptors: *Data collections, *Data storage and retrieval, *Hydrologic data, Streamflow, Rainfall, Dams, Safety, Computer programs, Data processing, *North Carolina, Information retrieval.

HISARS, an acronym for Hydrologic Information Storage and Retrieval System, is an electronic digital computer system that stores, retrieves and analyzes streamflow, rainfall, temperature, snow fall, and evaporation data as recorded at numerous stations in North Carolina. Also included is the Register of Dams and Damsites of North Carolina. Meteorological data are being updated to include calendar year 1971 and the streamflow data is updated to September 1972. Operations in HISARS are divided into three main divisions: Access, Processing, and Management. The Management function enables the user to add new records and correct or modify stored records. The Access function provides for various listing of stored data and the Processing function provides a statistical analysis of the stored data. Included in the Processing function are standard statistical calculations for daily values, monthly values, correlation analyses, frequency analyses, mass flow analyses and flow duration analyses. Data are stored on magnetic disc packs. Updating of the data base continues as the information becomes available. The HISARS program is written in PL-1. The system is operational on the IBM 370-165 computer at Triangle Universities Computation Center. A remote terminal to the computer is available at the North Carolina Office of Water and Air Resources. (McJunkin-North Carolina State)

HAWAII'S FLOATING CITY DEVELOPMENT PROGRAM. STRUCTURAL SIZING OF FLOTATION MODULES AND CONSTRUCTION BARGE,
Hawaii Univ., Honolulu. Dept. of Ocean Engineering.
I. R. Yumori.
Available from the National Technical Information Service, Springfield, Va 22161, as COM-74-11047, $5.25 in paper copy, $2.25 in microfiche. Technical Report No 5, UNIHI-SEAGRANT-CR-74-03. March, 1974. 105 p, 32 fig, 2 tab, 3 append, 8 ref. SG-2-35243.

Descriptors: *Computer programs, *Structural models, *Offshore platforms, Structural engineering, *Structural design, *Hawaii, Structural analysis, *Hydraulic structures, Programs, Data processing, Structures, Coastal structures, Shores, Architecture, Civil engineering, Construction, Design, Stress analysis, Structural behavior, Bodies of water, Harbors, Engineering structures, Planning.
Identifiers: *Honolulu(Hawaii), *Floating City, Floating platforms, Flotation modules, Construction barges.

The preliminary structural sizing of modules for a proposed Floating City in Hawaii is presented. The City would be constructed aboard a large deep-sea floating platform and would house domestic, commercial, recreational, industrial, and public activities, linked to Honolulu by transportation and communication. Effects of draft, waterplane area, material strength, and weight distribution on stability characteristics and structural design are discussed. Also considered are structural integrity, seakeeping, cost, and feasibility of the modules. Design and sizing of a construction barge is also required; it serves as a working surface, a transportation barge, and a loading platform. A computer program is developed to size the structure of the flotation chambers and module and to calculate stability characteristics of the individual modules and completed ring platform. Required inputs are standard flotation chamber dimensions, structural material, and weight distribution. The program varies the upper cylinder diameter, which determines waterplane area. The final design configuration of the floating chamber uses 8,000 psi concrete, 240-feet draft, 62-foot upper cylinder diameter, and a 2:1 bottom aspect ratio. All results are shown in graphic form, and the program listing is provided. (See also W75-03443) (Grden-North Carolina)

HAWAII'S FLOATING CITY DEVELOPMENT PROGRAM. CONSTRUCTION SITE SELECTION,
Hawaii Univ., Honolulu.
R. M. Kontingsberger, and S. B. Ribakoff.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74-11046, $4.25 in paper copy, $2.25 in microfiche. Technical Report No 6, UNIHI-SEAGRANT-CR-74-04, 1974. SG-2-35243.

Descriptors: *Offshore platforms, *Structural engineering, *Structural design, *Environmental effects, *Hawaii, Land use, Structures, Coastal structures, Shores, Construction, Civil engineering, Design, Bodies of water, Harbors, Planning, Comprehensive planning, Sites, Locating, Urbanization, Environment, Oceans, Islands, Water resources, Cities, Floating.
Identifiers: Barber's Point(Hawaii), Oahu(Hawaii), *Floating City, Floating platforms, Floating modules, Honolulu(Hawaii).

Criteria for selecting a construction site for a Floating City in Hawaii are presented. The city would be constructed aboard a large, deep-sea floating platform and would house domestic, commercial, recreational, industrial, and public activities, linked to Honolulu by transportation and communication. Criteria include: adequate area of sheltered water; channel negotiable by the constuction barge; access to skilled labor force, transportation and capital resources; and minimum environmental consequences. Three adequate sites were located - Kawaihae on Hawaii, Port Allen on Kauai, and Barber's Point on Oahu. Barber's Point is preferred since a deep draft harbor is needed and is being planned, the district is zoned for heavy industry, no incompatible land uses exist, and the site is on Oahu, where most of the State's capital and human resources are located. Arguing for another site, however, is the non-existence of the harbor and the continued lopsided trend toward high density and overdevelopment on Oahu. If financing for a deep harbor cannot be obtained independently of the project, other sites will be less expensive since they possess suitable harbors. (See also W75-03442) (Grden-North Carolina)
W75-03443

PVC SEWER PIPE MEETS TIGHT SPECIFICATIONS.
Public Works, Vol 105, No 7, p 84, July, 1974.

Descriptors: *Plastic pipes, *Sewers, Construction materials, Delaware, Water pollution control, Treatment facilities, Design.
Identifiers: *PVC sewer pipes, New Castle County(Del).

Twenty-five sewer construction projects are underway in New Castle County, Delaware, in anticipation of a rise in population. Johns-Manville Ring-Tite PVC sewer pipes in 8-inch to 12-inch sizes are being selected due to their availability and reliance in meeting the strict infiltration/exfiltration limitations. Also the pipe's light weight and 20-foot lengths allow trenches to be opened and closed quickly. (Sandoski-FIRL)

PREDICTING THE FLOW OF WATER WITHIN A CHANNEL BOUNDARY OF GRAVEL,
Mississippi State Univ., State College. Dept. of Agricultural and Biological Engineering.
Y. K. Tang.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 636, $4.25 in paper copy, $2.25 in microfiche. Ms Thesis, May 1973. 50 p, 10 fig, 5 tab, 12 ref, append. OWRT A-057-MISS(2).

Descriptors: *Open channel flow, *Boundaries(Surfaces), *Porous media, Free surfaces, Gravels, Flow, Channel erosion, Flumes, Velocity, Shear, Slopes, Gradients(Streams), Protection, Darcys law, Chezy equation, Mannings equation, Regression analysis, Roughness(Hydraulic), Reynolds number, Porosity, Particle size, Laboratory tests.
Identifiers: Flow depth, Average discharge velocity, Seepage velocity.

An empirical relationship was developed describing the discharge velocity of water flowing within a channel boundary of gravel as a function of the gravel size, channel slope, and flow depth above a gravel layer of uniform thickness of 4.5 inches. The nature of the function was determined from the analysis of laboratory observations. The laboratory tests were conducted in a 50 ft long, 1 ft wide, and 1 ft deep rectangular channel. Observations were made by varying one independent variable and holding the other independent variables constant. Three sizes of gravel ranging between 0.25 and 1.5 inches in diameter, six channel slopes between 0.00125 and 0.00750, and six flow depths between 0.5 and 5.5 inches were used. The discharge velocities within the gravel layer were measured with a hot-film anemometer. Multiple regression techniques were utilized to obtain the prediction equation. The analysis of variance and the coefficient of determination showed that the prediction is a good predictor. (Visocky-ISWS)

HYDRODYNAMIC EFFECTS ON FLOW THROUGH SCREENS AT INTAKES,
Bechtel, Inc., Gaithersburg, Md.
A. M. Alsaffar.
Water Research, Vol 8, No 9, p 617-622, September 1974. 7 fig, 10 ref.

Descriptors: *Screens, *Fish barriers, *Head loss, *Intakes, Hydraulics, Drag, *Hydrodynamics, Continuity equation, Velocity, Momentum equation, Flow resistance, Fish conservation.
Identifiers: Grids.

Screens placed at intakes to protect fish were investigated. The effects of approach velocity, wire area, and screen angles less than 90 degrees to the flow were considered. Equations were developed for the pressure drop coefficient and for the flow angle downstream from the screen. These parameters were found to depend on the drag coefficient and the three conditions initially considered. Results were presented in a form useful for design of fish protective screens at intakes. (Adams-ISWS)

ANTI-HEAVE PROTECTIVE SYSTEM,
Compagnie Generale pour les Developpements Operationnels des Richesses Sous-Marines, Paris (France). (assignee)
J. E. Lamy.
US Patent No 3,849,990, 4 p, 17 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 928, No 4, p 1447, November 26, 1974.

Descriptors: *Patents, *Shore protection, *Breakwaters, *Pollution abatement, Waves(Water), Offshore platforms, Oil industry, Heaving.
Identifiers: Wave effects, *Heave effects, Port facilities, Offshore facilities, Submarine deposits, Underwater mining.

A wall is provided with projecting studs arranged in staggered relation. The studs are adapted to slow ascending and descending water flows against the wall exposed to wave and heave action. Circulation-generating fluid deviations and end eddies are introduced. The studs can consist of pipes draining water through the apertures of a perforated wall of a breakwater of a perforated caisson type. (Sinha-OEIS)

BOUNDARY EFFECTS ON DILUTION OF BUOYANT JETS,
Memorial Univ. of Newfoundland, St. John's. Faculty of Engineering and Applied Science.
J. J. Sharp, and G. Wang.
In: Water Pollution Research in Canada 1973, Vol 8, p 168-177, 6 fig, 8 ref.

Descriptors: *Jets, *Waste dilution, *Outfall sewers, Coasts, Mixing.
Identifiers: Buoyant jets.

Large marine outfalls are laid on the ocean bed with jets discharging horizontally at right angles to the pipe axis. When first installed the jet discharges at a distance above the bed equal to half the pipe diameter but subsequent current scour may bring the jet into much closer proximity with the floor, or in soft sediments, with time, the jets will discharge at or below the sea bed level. The dilution achieved in a single jet under such conditions was investigated with resultant conclusions that the dilution of a buoyant jet discharged in close proximity to a horizontal floor, is considerably greater than that obtained in a free jet. The magnitude of the increase in dilution varies depending on the values of relevant parameters but comparisons indicate that an increase in the order of 200% to 500% would not be uncommon. As the jet leaves the discharge nozzle it tends to cling to the floor before rising, thus changing the shape of the trajectory and increasing dilution. The implications are that, for the type of ocean outfall described, settlement of the discharge pipe due to scour will have a beneficial effect on the dilution achieved between outfall and surface. (See also W75-03770) (Auen-Wisconsin)
W75-03780

OIL-IN-WATER EMULSIONS AND THEIR FLOW PROPERTIES IN POROUS MEDIA,
Chevron Research Co., Richmond, Calif.
C. D. McAuliffe.
Journal of Petroleum Technology, Vol 25, p 727-733, June, 1973. 10 fig, 3 tab, 16 ref.

Descriptors: Porosity, *Emulsions, *Groundwater, Oil reservoirs, Drilling fluids, Injection wells, Sandstones, Penetration, Heterogeneity, Displacement, Capillary action, Asphalt, Viscosity, Drops(Fluids), Equipment, Flow, Permeability, Cores, Saturated flow.
Identifiers: *Oil-in-water emulsions, Porous media, Emulsion flow, Waterfloods, Oil recovery, Producing wells, Fingering, Jamin effect, Crude oil, Droplets, Pseudo non-Newtonian flow.

In waterfloods, the rapid channeling of water from injection to producing wells through the more permeable portions of the reservoir gives low oil recovery. Laboratory investigations were undertaken to determine the properties of oil-in-water emulsions and to study the flow of emulsions through porous media. Samples of core material can be considered as miniature reservoirs and the cores are heterogeneous. The following conclusions were drawn: (1) Crude oil-in-water emulsions can be easily prepared from some asphaltic crude oils and dilute solutions of sodium hydroxide. (2) Emulsions containing up to 50% oil have viscosities in bulk that are less than 20 times that of water, even though the oil viscosities may range up to 1 million cp at room temperature. (3) Emulsions prepared from various asphaltic crude oils have droplets of different sizes. (4) Oil-in-water emulsions can effectively reduce the water permeabilities of sandstone cores if the initial water permeabilities are less than 2 darcies. (5) The permeability reduction caused by injecting emulsion is retained even when the emulsion is followed by many pore volumes of water. (6) Flow of oil-in-water emulsions through porous media is pseudo non-Newtonian, regardless of how much oil the emulsion contains. (7) In these experiments, with cores of different permeabilities mounted in parallel, oil-in-water emulsion proportionally reduced the permeability in high-permeability cores more than in cores of lower permeability. (Campbell-NWWA)

MONITORING OF EARTH-ROCK DAMS,
Snowy Mountains Engineering Corp., Cooma (Australia). Materials Branch.
A. D. Hosking.
Australian Geomechanics Journal, Vol G4, No 1, p 1-12, 1974. 14 fig, 15 ref.

Descriptors: *Design data, *Instrumentation, *Monitoring, *Rockfill dams, Dam design, Design criteria, Dams, Dam construction, Earth dams, Reservoir operation, Pressure measuring instruments, Strain measurement, Seismic properties, Structures, *Australia.
Identifiers: Snowy Mountains Hydroelectric Scheme(Aust).

Dams are monitored during construction to check on the predictions of design factors and allow for modification of designs where necessary, and during their operational life to ensure their safety, and determine the effects of operational practices and external influences. Data are also derived for the design of future dams. The data required are principally related to neutral and total stresses, and to movements and strains; the response of the dam to seismic shock may also be required. The types of instruments employed, both embedded and surface-installed, are reviewed and discussed. An outline of methods of presenting the data obtained is provided, with illustrative examples covering several of the earth-rock dams of the Snowy Mountains Scheme. The frequency of observations is discussed. (Levick-CSIRO)

STRUCTURAL BEHAVIOR OF A FLEXIBLE METAL CULVERT UNDER A DEEP EARTH EMBANKMENT USING METHOD A BACKFILL,
California State Div. of Highways, Sacramento. Bridge Dept.
D. W. Spannagel, R. E. Davis, and A. E. Bacher.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-233 589, $7.00 in paper copy, $2.25 in microfiche. Report No CA-Hy-BD-624111-73-6, June 1973. 220 p, 120 fig, 13 tab, 17 ref, 1 append. D-4-24.

Descriptors: *Culverts, *Embankments, *On-site data collections, *Design, *Backfill, Structural design, Engineering structures, Roads, Highways, Instrumentation, Structural behavior, Investigations, Analytical techniques, Evaluation, Prototype tests, Earth pressure, Stress, Stress analysis, Hydraulic structures, Soil mechanics, Soil pressure, Steel pipe.
Identifiers: Flexible culverts, Structural-steel plate pipe.

A culvert consisting of twin 108-inch-nominal-diameter structural steel plate pipes was buried under 160 feet of highway embankment at Apple Canyon using Method A (soil) backfill. Two cross-sections were extensively instrumented to determine soil pressures, displacements, strains, and settlements at various fill heights and following construction completion. Results indicated that the soil pressures were linear functions of fill height and produced fairly uniform peripheral distributions. Displacements were small. Stresses exceeding the specified minimum yield were observed without apparent structural damage. Theoretical analysis procedures were applied to the installation to determine their relative merit. The finite element procedure proved the best, although sufficient soil property data were not available to predict accurately pipe displacements and stresses. Comparisons were made between this installation and a similar structural plate pipe at Chadd Creek using Method B (baled straw) backfill. The Method A backfill technique was found to be superior to Method B due to the uniformity of pressures, stresses, and moments obtained. (Humphreys-ISWS)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-231 912, $9.50 in paper copy, $2.25 in microfiche. Report No UILU-ENG 73 2013, August 1973. 320 p, 109 fig, 23 tab, 48 ref, 4 append. DOT FR-20020.

Descriptors: *Tunnels, *Laboratory tests, *Tunnel linings, *Concrete technology, Testing, Evaluation, Concrete additives, Concrete testing, Concrete mixes, Prototypes.
Identifiers: *Tunnel supports, *Large scale tests, Steel fiber, Regulated-set concrete, Precast polymer concrete segments.

Presented were the results of engineering studies related to the development of new and improved tunnel support systems. Steel fiber reinforced regulated-set concrete was proposed for use as a slipformed concrete lining which can be placed immediately behind a tunnel boring machine. Mix design studies and field pumping tests for this new concrete were described. The results of a cooperative research effort carried out with the U.S. Bureau of Reclamation on precast polymer concrete segmented tunnel support systems included an evaluation of the structural aspects of the system, an analysis of potential heat and fire hazards, and an evaluation of the cost of the promising new support system. The design, construction, and operation of a large-scale test facility to test both circular and horseshoe-shaped tunnel supports with a span of 10 feet were described. These tests are expected to result in the adoption of more effective and economical liners and supports. Large-scale tests which will evaluate the structural behavior of steel fiber regulated-set concrete were described. These tests are being conducted in connection with the development of an extruded liner tunneling system. (Humphreys-ISWS)

NEW RUBBER EXPANSION JOINTS FOR PIPELINES.
Water Services, Vol 18, No 935, p 21, January, 1974.

Descriptors: *Expansion joints, *Rubber, *Pipelines, Design data, Flexibility.
Identifiers: United Kingdom.

Rubber expansion joints for pipelines are being marketed in the United Kingdom by United Flexible Metallic Tubing Company, Limited. The joints are available in a variety of qualities of rubber and can be fitted for aggressive chemicals. They have a strong multi-ply nylon fabric carcass with wire reinforced collars and a weather proof external cover. Sizes range from 32-300 mm bore. The over length is 130 mm. Total axial movement possible is plus or minus 30 mm from the normal free length. Maximum lateral offset is from 20-30 mm depending on diameter. The joints provide a versatile and economic means of achieving flexibility in pipelines conveying fluids under pressure or vacuum. All forms of movement can be compensated for, and they also serve to dampen vibrations and prevent the transmission of noise. (Merritt-FIRL)

8H. Rapid Excavation

SELECTED PHYSICOCHEMICAL PROPERTIES OF BASALTIC ROCKS, LIQUIDS, AND GLASSES,
Los Alamos Scientific Lab., N. Mex.
M. C. Krupka.
Available from the National Technical Information Service, Springfield, Va. 22161, as Rept. No LA-5540-MS;, $4.00 in paper copy, $2.25 in microfiche. Report No LA-5540-MS, March 1974. 11 p, 18 fig, 9 tab, 27 ref.

Descriptors: *Basalts, *Physicochemical properties, *Physical properties, *Chemical properties, *Thermodynamic behavior, *Rock properties, *Liquids, *Melting, Radioactivity, Research and development, Viscosity, Density, Thermal capacity, Thermal conductivity, Geothermal studies, Thermal expansion, Mechanical properties, Specific heat, Waste disposal, Systems analysis.
Identifiers: *Glasses.

Rock-melting systems are under development. Based on the concept of progressive localized melting of the rock encountered in forward motion and subsequent chilling of the melt to a glass, these systems, when fully developed, have the potential of contributing significant improvements to the general field of excavation technology. Selected physicochemical properties of basaltic rocks, liquids, and glasses are presented including viscosity, thermal diffusivity, thermal conductivity, specific heat, density, thermal expansion coefficient, and average chemical composition. FOOD SELECTION BY LABEOROHITA (HAM.) AND ITS FEEDING RELATIONSHIP WITH OTHER MAJOR CARPS,
Aligarh Muslim Univ. (India). Dept. of Zoology.
Rashid A. Khan, and A. Qayyum Siddiqui.
Hydrobiologia, Vol 43, No 3/4, p 429-442, 1973, Illus.
Identifiers: Algae, *Carps, Catla-catla, Cirrhina-mrigala, Crustacea, Growth, *Labeo-rohita, Phytoplankton, Ponds, Protozoa, Rivers, Rotifers, Vegetation, Zooplankton, Fish ponds, *Fish food organisms.

Selectivity of food by L. rohita was studied in a stocking pond (Moat), by calculating an electivity index (E) for each food organism as described by Ivlev. L. rohita was definitely selective in its feeding. In case of fingerlings, there was a strong selection for zooplanktonic organisms (Arcella and Dif-

flugia among protozoans, Keratella and Brachionus among rotifer and Daphnia and Cyclops among crustaceans) and smaller algae (Cosmarium and Closterium among desmids, Euglena and Volvox among phytoflagellates and algal spores and zygotes) while most of the phytoplanktonic organisms, belonging to green algae, diatoms and blue green algae, were avoided. In case of adults, a strong negative selection was observed for all zooplanktonic organisms and a strong positive selection for most of the green algae and diatoms (Ankistrodesmus, Zygnema, Spirogyra, Selenastrum, Pediastrum, Scenedesmus, Tetraspora, Stephanodiscus, Naviculla, Diatoma, Synedra and Nitzchia). However, all blue green algae were avoided. The feeding relationship of L. rohita with other major carps, Cirrhina mrigala and Catla catla was studied in 2 different habitats, pond and river. The adults of L. rohita fed mainly on phytoplankton and macrovegetation, the main food of adult C. mrigala was decayed organic matter, sand and mud supplemented by plankton, while the food of adult C. catla was chiefly composed of zooplankton, and some phytoplankton.--Copyright 1974, Biological Abstracts, Inc.
W75-03496

OBSERVATIONS ON A BREEDING PAIR OF TILAPIA RENDALLI RENDALLI BOULENGER 1896 IN AN EXPERIMENTAL TANK AT LAKE KARIBA FISHERIES RESEARCH INSTITUTE,
D. H. S. Kenmuir.
Hydrobiologia, Vol 43, No 3/4, p 365-370, 1973, Illus.
Identifiers: *Breeding, Climates, Fisheries, Lakes, *Rhodesia(Lake Kariba), Temperature, *Tilapia-rendalli-rendalli, Weeds, *Fish ponds, Fish management.

A pair of breeding T. r. randalli were installed in a tank at the Lake Kariba Fisheries Research Institute (Rhodesia) in order to determine the number of times they would breed in a yr under Kariba climatic conditions. The pair bred almost monthly from Jan. until May, when temperatures in the tank dropped below 20C, the minimum temperature at which this species will breed. Breeding commenced again in Sept., when temperatures were above 20C and continued monthly to the end of the yr. A total of 8 breedings in the calendar yr of 1971 were recorded. T. rendalli could breed at least 8 times a yr in the Lake. This represents a considerable capacity for increase and in view of the destructive weed-eating habits of T. r. rendalli effort should be made to find a way to crop this species, which is not effectively caught by gill nets.--Copyright 1974, Biological Abstracts, Inc.
W75-03501

THE PLANKTON OF NEW TRANSFER-PONDS AT THE GOLYSZ FARM,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
L. Krzeczkowska-Woloszyn.
Acta Hydrobiol, Vol 15, No 4, p 427-436, 1973, Illus.
Identifiers: Algae, *Carp production, *Fertilization, *Phytoplankton, *Poland(Golysz Farm), Ponds, *Zooplankton, Fish ponds, *Fish transfer ponds, Fish foods, Fish management.

Earlier investigations are continued on the plankton of the 1st and 2nd transfer-ponds in the 1st yr after their construction (for carp production). It discusses the development of plankton with the application of another type of fertilization. The observed changes in the phyto- and zooplankton indicate a structure more consistent with that occurring in water bodies utilized for a longer time. The analyses of the fertilization did not reveal any influence on the numbers of plankton. Among other factors, some role was probably played by its composition, chiefly among the algae.--Copyright 1974, Biological Abstracts, Inc.

HYDRODYNAMIC EFFECTS ON FLOW THROUGH SCREENS AT INTAKES,
Bechtel, Inc., Gaithersburg, Md.
For primary bibliographic entry see Field 8B.
W75-03659

FLOATING WATER SCREEN,
FMC Corp., San Jose, Calif. (assignee)
R. G. Bottorf.
U.S. Patent No. 3,843,520, 5 p, 7 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 927, No 4, p 1637, October 22, 1974.

Descriptors: *Patents, Water treatment, *Screens, *Fish barriers, *Fish conservation, Equipment, Conservation, Water level fluctuations.
Identifiers: *Ice formation, *Fish screens, Floating water screens.

A floating water screen installation for use in bodies of water in which the water level varies comprises an anchoring structure on the bed of such a water body. It includes a fixed vertical hollow central column and an outlet pipe in communication with the column. A buoyantly supported generally cylindrical screen structure, having an enclosed bottom, is mounted in a surrounding relationship to the column for vertical sliding motion on the column in response to changes in water level, and for rotation about the column. Long vertical slots are provided in the central column to admit only screened water to the outlet pipe. Rotary drive and screen backwash systems are also described. One object of this device is intended to be the protection and conservation of fish. This is accomplished by the provision of a screening structure with a low velocity water flow through the screen areas to permit fish to swim away and the elimination of pockets and areas in which the fish may be trapped. Additional objects include the provision of rotating drives which reduce ice formation around the floating screen structure and multiple removable screen panels for simplified maintenance and repair. (Sinha-OEIS)
W75-03745

MARINE FISH CULTURE IN BRITAIN: IX. GROWTH OF CULTURED PLAICE TO MARKETABLE SIZE IN THE LABORATORY,
Marine Biological Station, Port Erin, Isle of Man (England).
A. B. Bowers.
J Cons Cons Int Explor Mer. Vol 35, No 2, p 149-157, Illus 1974.

Descriptors: Europe, Sea water, Fish, *Fish management, Fish populations, Fish reproduction, *Fish growth.
Identifiers: Great Britain, *Plaice, Pleuronectes-Platessa.

Plaice (Pleuronectes platessa) were reared in unheated sea water in the laboratory through 2 generations. Selected 2nd generation plaice were measured and weighed every 2 mo. One group of fish cultured at a density of 13 fish/m2 of tank area gave a yield of 11.6 kg of marketable plaice 21 mo. from hatching for a food consumption of 56 kg. Plaice cultured in laboratory tanks grew faster than wild plaice in the sea and were heavier for their length. Seasonal variations in growth of cultured plaice were similar to those shown by wild plaice in the sea.--Copyright 1974, Biological Abstracts, Inc.
W75-03759

AN ELECTRICAL BARRIER FOR PREVENTING MIGRATION OF FRESHWATER CRAYFISH IN RUNNING WATER: A METHOD TO STOP THE SPREAD OF THE CRAYFISH PLAGUE,
Uppsala Univ. (Sweden). Inst. for Physiologic Botany.
T. Unestam, C. Nestell, and S. Abrahamsson.
Rep Inst Freshwater Res Drottningholm 52, 199-203, Illus. 1972.

Descriptors: *Water pollution control, Fish control agents, *Crayfish, Aquatic animals, Aquatic life, Crustaceaus, Electronic equipment, Europe, Freshwater, Rivers, Running waters, Streams, *Fish barriers, Barriers, Fish migration.
Identifiers: Astacus-astacus, Sweden.

The electronic device described was tested in a stream of the River Tidan, Vastergotland, Sweden. Crayfish up to 1 m from the device were paralyzed; since the plague fungus survives only several weeks after all crayfish have succumbed, the time necessary to maintain the barrier is short.--Copyright 1974, Biological Abstracts, Inc.

SEA GRANT PROGRAM 1973, STATE UNIVERSITY SYSTEM OF FLORIDA.
Florida Univ., Gainesville. Marine Advisory Program.
(1973). 24 p, 12 photo, 2 tab, 26 ref.

Descriptors: *Florida, *Government finance, *Estuaries, *Research and development, Comprehensive planning, Economics, Decision-making, Grants, Projects, Water resources development, Federal government, State governments, Local governments, Fisheries, Fishing, Fish management, Environmental effects, Coasts, Resources development, Economic aspects, Wetlands, Coastal marshes, Conservation.
Identifiers: Coastal waters, Coastal zone management, State policy.

Research has contributed information to decisions such as the Florida state purchase of coastal lands, siting of a sewage outfall and an oil well, cutting an inlet, and redesigning a commercial fishing trawl. Increasing the number of participating universities to five, developing closer ties with other marine-oriented organizations, and establishment of a quality publications series, all strengthened Sea Grant in Florida. Research concerning estuarine management, fisheries resources, ocean engineering, and aquaculture is reported. Research was done on some Gulf coast estuaries to develop information to decide how to balance the many uses of these areas. Florid's fisheries resources make possible a far-flung economic enterprise with local, state, national and international interests. Three projects were designed to provide information for the harvesting, handling, and utilization of renewable fisheries resources. (Sperling-Florida)

PUBLICATIONS LIST OF THE IDAHO WATER RESOURCES RESEARCH INSTITUTE.
Idaho Univ., Moscow. Water Resources Research Inst.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 633, $4.25 in paper copy, $2.25 in microfiche. Research Report, April 1974. 44 p, 1 append. OWRT A-999-IDA(5).

Descriptors: *Publications, *Water Resources Institute, *Bibliographies, Information retrieval, *Research and development, Indexing, Documentation, *Idaho.

The various publications, thesis and papers prepared in conjunction with the Idaho Water Resources Research Institute activities were listed. All entries listed are either contained in the Institute's Reading Room or in the project file. Some of the publications are available free of charge, but photo copies of all publications are available at five cents per page. To assist in referring to any particular report or group of reports, the listing was subdivided into four basic categories: OWRR allotment projects, OWRR matching grants, Title II grants, and Miscellaneous publications. Each entry was referenced in both an author index and a research category index. A detailed description of the FCST research category descriptions was provided as an appendix to explain the use of the research cateogry index. It was hoped that these publications will increase the exchange of ideas, that interest in water related research and training will be encouraged, and that academic cooperation and communication with all interested parties will be enhanced as a result of the added knowledge on water and its management. AIR POLLUTION

Sources of Phosphorus Inputs from the Atmosphere and Their Significance to Oligotrophic Lakes,
W75-03304 5B

Air and Water Pollution Control in Crude Tall Oil Manufacture in the Pulp and Paper Industry,
W75-03598 5D

On the Spring Maximum of the Concentration of Trace Constituents in Atmospheric Precipitation,
W75-03621 5B

Determination of Lead in Atmospheric Particulates by Furnace Atomic Absorption,
W75-03624 5A

Removing Three Air Pollutants at Once.
W75-03631 5D

The Application of Repro-Modeling to the Analysis of a Photochemical Air Pollution Model,
W75-03633 5B

Pollution Control Awards Program.
W75-03731 6E

AIR POLLUTION CONTROL

A Sludge Cake Incineration Process and Air Pollution Control System,
W75-03546 5D

AIR TEMPERATURE

Lucerne in Wet Soils: The Effect of Stage of Regrowth, Cultivar, Air Temperature and Root Temperature,
W75-03847 2I

ALABAMA

Altering Alabama's History,
W75-03688 4A

Beaunit v. Alabama Power Co. (Action Against Corporation for Lowering River Level by Dam).
W75-03719 6E

ALASKA

Soil Moisture-Vegetation-Temperature Relationships in Central Alaska,
W75-03657 2G

ALGAE

Accumulation Experiments with Lindane in a Culture of Dunaliella for Standardization of an Algae Test. (Akkumulationsversuche von Linden in einer Kulter von Dunnaliella spec. zur Standarisierung eines Algentestes),
W75-03508 5C

Investigations on the Incorporation of Different Algae by Some Zooplankton-Species, (In German),
W75-03643 5C

Algal Nutrient Limitation in Lake Ontario and Tributary Waters,
W75-03757 5C

Heavy Metal Tolerance in Algae Isolated from Polluted Lakes Near the Sudbury, Ontario Smelters,
W75-03781 5C

Observations on the Nutrition of Larvae of Chironomus f.l. Plumosus in the Waters of the Danube Flood Area, (In Romanian),
W75-03827 2I

ALGAL TOXINS
Purification of Aphanizomenon flos-aquae Toxin and Its Chemical and Physiological Properties,
W75-03324 5C

ALGORITHMS
Use of Interactive Computer Graphics in Water Resources Planning and Management,
W75-03301 6A

Optimal Identification of Parameters in an Inhomogeneous Medium with Quadratic Programming,
W75-03804 2F

ALKALI METALS
The Extraction of Nickel from Various Salt Solutions with Oxine in Chloroform,
W75-03630 2K

ALLOTMENTS
City of New York V. Train (Action Brought to Compel Release of Funds Authorized Under FWPCA),
W75-03703 6E

ALSEA RIVER (ORE)
1971 Alsea River Estuary Resource Use Study,
W75-03346 6C

ALTERATION OF FLOW
Conservation--Alteration of Streams.
W75-03675 6E

ALTERNATIVE COSTS
Economic Evaluation and Determination of Plant Capacity and Dam Height,
W75-03328 6B

ALTERNATIVE WATER USE
Opportunities for Watershed Management in Wyoming,
W75-03326 4D

ALUM
New Concepts for Clarification of Water Using Some Alternatives to Alum,
W75-03374 5D

Water Treatment Plant Wastes Disposal-Part 2,
W75-03444 5D

ALUM RECOVERY
Alum Recovery from Water and Wastewater Treatment Plant Sludges,
W75-03542 5D

ALUM SLUDGE
Disposal of Alum Sludge to the Existing Activated Sludge Wastewater Treatment Plant,
W75-03774 5D

ALUMINUM
Removing Three Air Pollutants at Once.
W75-03631 5D

AMBERLITE RESINS
Decolorizing Dye Wastes,
W75-03608 5D

AMES RESERVOIR (IA)
Ames Reservoir Environmental Study, Appendix 1. Natural and Archaeological Resources of the Reservoir Site and Stream System.
W75-03318 6G

AMINO ACIDS
Determination of the Composition and the Stability Constants of Complexes of Mercury (II) With Amino Acids,
W75-03798 5A

AMMONIA
Content of Chemical Substances in Farm Crops Grown on Soil Irrigated with Waste Waters of Coke By-Product Plants, (In Russian),
W75-03846 5B

ANAEROBIC DIGESTION
Anaerobic Digestion of Organic Matter,
W75-03371 5D

Treatment Facility Incorporates Unique Design Features,
W75-03379 5D

Anaerobic Digestion of Primary Sludge Containing Iron Phosphate,
W75-03776 5D

ANAEROBIC TREATMENT
Temperature-Substrate Interactions in Biological Treatment,
W75-03445 5D

ANALYSIS
Determination of the Size Distribution of Dissoved Organics in Effluents,
W75-03771 5D

ANALYTICAL TECHNIQUES
Gas Chromatography of Volatile Metal Chelates: Application of a New Technique to Metal Analysis in Natural Waters,
W75-03305 5A

Determination of Mercury in Water and Plant Material by Flameless Atomic Absorption,
W75-03504 5A

The Planning Audit: A Framework with Particular References to River Basin Planning,
W75-03525 6B

Automatic Dosage of Sulfates by an Improved Nephelometric Method (Dosage Automatique des Sulfates par une Methode Nephelometrique Amelioree),
W75-03536 5A

Determination of Total Water Hardness by Conductometric Titration with Complexing Agents (Determinarea duritatii toale a apei prin titrari conductometrice cu complexoni),
W75-03604 5A

The Determination of Arsenic by Non-Dispersive Atomic Fluorescence Spectrometry with a Gas Sampling Technique,
W75-03612 5A

A Study of Adsorption Characteristics of Traces of Chromium(III) and (VI) on Selected Surfaces,
W75-03613 5A

The Opening Up of Insoluble Oxides (Tantalum, Niobium, Chromium, Aluminium, and Others), With Liquid Selenium Dioxide,
W75-03614 5A

Mercury Determination at the Microgram Level by a Reduction-Aeration Method of Concentration,
W75-03617 5A

Atomic Absorption Spectrophotometric Determination of Microgram Levels of CO, NI, CU, PB, and ZN in Soil and Sediment Extracts Containing Large Amounts of MN and FE,
W75-03618 5A

Radiorespirometry: Rapid Toxicological Screening of Environmental Pollutants,
W75-03619 5A

Selective Determination of Iron in Alloys by Reaction with 2,3-Pyridinediol and Ring Colorimetry,
W75-03623 2K

Determination of Lead in Atmospheric Particulates by Furnace Atomic Absorption,
W75-03624 5A

Kinetic-Coulometric Determination of Mercury in Biological Samples,
W75-03627 5A

Photometric Titration of Beryllium(II) with 5-Sulfosalicylic Acid,
W75-03629 2K

Chemical Analyses for Water Quality - Training Manual.
W75-03785 5A

Gravimetric Estimation of Silver as Diamminesilver (I) Tetraisothiocyanatodianilinechromate (III),
W75-03790 5A

Method for Determination of Selenium, Arsenic, Zinc, Cadmium, and Mercury in Environmental Matrices by Neutron Activation Analysis,
W75-03792 5A

Determination of Mercury in Fluorspar Mining Survey Samples,
W75-03794 5A

Bacteriophages as Viral Pollution Indicators,
W75-03816 5A

ANIMAL METABOLISM
Selenium Biochemistry,
W75-03620 5C

ANIMAL PHYSIOLOGY
Renal Concentration of Citrate as a Negative Modulator of Diuretic Response to Mercurials,
W75-03616 5C

ANIMAL POPULATIONS
Vertebrates of the Enterprise Forest: A General Survey,
W75-03413 5C

Snail Population in Running Water,
W75-03803 2I

ANTARCTIC
Subglacial Geomorphology Surrounding the Ice-Free Valleys of Southern Victoria Land, Antarctica,
W75-03667 2C

ANTHROPOLOGICAL ANALYSIS
Displacement of Persons by Major Public Works, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures---Phase 5,
W75-03308 6B

ANTIMONY
Peat: New Medium for Treating Dye House Effluent,
W75-03577 5D

APHANIZOMENON FLOS-AQUAE
Purification of Aphanizomenon flos-aquae Toxin and Its Chemical and Physiological Properties,
W75-03324 5C

AQUARIA
Tidal Aquarium for Laboratory Studies of Environmental Effects on Marine Organisms,
W75-03521 5C

AQUATIC ANIMALS
Specific Production of Aquatic Invertebrates,
W75-03327 5C

Determination of Mercury in Commercially Important Aquatic Organisms,
W75-03796 5B

AQUATIC HABITATS
The Delaware Estuary System, Environmental Impacts and Socio-Economic Effects. Delaware River Estuarine Marsh Survey,
W75-03441 6G

AQUATIC POPULATIONS
Population Dynamics of Hoplolaimus Sp. at Various Levels of Soil Moisture,
W75-03832 5C

AQUATIC WEED CONTROL
Aquatic Weed Harvesting Costs and Equipment--1972,
W75-03391 4A

AQUATIC WEEDS
Static Pressure Fractionation Characteristics of Water Hyacinth,
W75-03302 4A

AQUEOUS SOLUTIONS
On the Choice of Methods for the Prediction of the Water-Activity and Activity Coefficient for Multicomponent Aqueous Solutions,
W75-03540 2K

The Extraction of Nickel from Various Salt Solutions with Oxine in Chloroform,
W75-03630 2K

AQUICULTURE
The Role of Aquaculture in Fishery Development and Management,
W75-03355 6C

Alternatives in Aquacultural Development: Consideration of Extensive Versus Intensive Methods,
W75-03398 6B

The Use of Pollutants for Aquaculture - Conditioning of Wastes for Aquaculture,
W75-03514 5D

Preliminary Experiments on the Effect of Thiodan and Endrin on Fish Culture in Indonesia,
W75-03515 5C

Recent Developments in the New Zealand Rock Oyster Farming Industry (1970-72) and Problems Regarding Aquatic Pollution,
W75-03516 5C

Sewage and Aquacultural Production,
W75-03524 5D

AQUIFER CHARACTERISTICS
Collection and Analysis of Pump Test Data for Transmissivity Values,
W75-03421 5B

AQUIFERS
Optimal Identification of Parameters in an Inhomogeneous Medium with Quadratic Programming,
W75-03804 2F

(ARCH. HYDROBIOL. 66:1-36
A Critical Review of Vollenweider's Nutrient Budget Model and Other Related Models,

Recent Limnological Studies of Okanagan Basin Lakes and Their Contribution to Comprehensive Water Resource Planning,
W75-03769 2H

Water Pollution Research in Canada 1973,
W75-03770 5D

CANADA (HUDSON BAY)
Snow-Vegetation Relationships in the Forest Tundra of Nouveau-Quebec, Hudson Bay, (In French),
W75-03849 2I

CANADA (MATAMEK RIVER)
Observations on the Ecology of Lacrustrine Populations of the Threespine Stickleback (Gasterosteus Aculeatus L., 1758) in the Matamek River System, Quebec,
W75-03625 5C

CANADA (ONTARIO)
Organochlorine Insecticide Residues in Sediment and Fish Tissues, Ontario, Canada,
W75-03495 5C

CANADA (ROCKY MOUNTAIN REGION)
Effects of Experimental Soil Moisture Fluctuations on Turnover Rates of Testacea,
W75-03681 2G

CANAL CONSTRUCTION
Canal Authority of State of Florida v. Callaway (Injunction to Stop Construction).
W75-03360 6E

Environmental Defense Fund, Inc. v. Corps of Engineers of the United States Army (Action to Restrain Corps from Further Construction of Navigation Project).
W75-03361 6E

CANALS
Illinois and Michigan Canal.
W75-03725 6E

CANOPY
Properties of the Tree Flora in the Forest Transition from Aspen to Maple-Birch Type,
W75-03409 5C

CAPILLARY CONDUCTIVITY
Determination of Liquid Conductivity of Capillary Porous Solids,
W75-03532 2G

CARBOHYDRATES
Effect of BOD(5) Loads and Carbohydrate Concentration on Waste Waters on the Development of Filamentous Bacteria (Vliyanie nagruzok po BPK(5) i kontsentratsii uglevodov v stochnykh vodakh na razvitie nitchatoi bakterii),
W75-03583 5D

CARBON
High Rate Biological Denitrification Using a Granular Fluidized Bed,
W75-03382 5D

CARBON-14 TRACERS
Investigations on the Incorporation of Different Algae by Some Zooplankton-Species, (In German),
W75-03643 5C

CARP
Toxicity of 2-(Digeranylamino)-Ethanol, A Candidate Selective Fish Toxicant,
W75-03509 5C

CARP PRODUCTION
The Plankton of New Transfer-Ponds at the Golysz Farm,
W75-03502 8I

CARPS
Food Selection by Labeorohita (Ham.) and Its Feeding Relationship with Other Major Carps,
W75-03496 8I

CATCHMENTS
Ecology of River Narmada Upper Catchment Area in Central India: I. Introduction, Situation, Terrain, Lithology, Climate, General Forests and Methods of Vegetational Analysis,
W75-03826 4D

CATION EXCHANGE
An Automated Method for Determination of Chloride and Sulfate in Freshwater Using Cation Exchange and Measurement of Electrical Conductance,
W75-03576 5A

Separation of Copper (II) from Uranium (VI) and Many Other Elements by Cation-Exchange Chromatography in Acetone-Hydrobromic Acid Media - Improved Selective Separation of Copper,
W75-03628 5A

CATIONIC POLYMERS
New Concepts for Clarification of Water Using Some Alternatives to Alum,
W75-03374 5D

CATS
Subacute Toxicity of Methylmercury in the Adult Cat,
W75-03448 5C

CATTAILS
Heavy Metal Tolerance in Typha Latifolia Without the Evolution of Tolerant Races,
W75-03513 5C

CATTLE
Production and Utilization of Fodder and Grain Sorghum as Forage for Cattle in the Ord River Valley, Western Australia,
W75-03830 3F

CELLULOSE
Modified Cellulose Adsorbent for Removal of Mercury From Aqueous Solutions,
W75-03579 5D

CENSUS
Vertebrates of the Enterprise Forest: A General Survey,
W75-03413 5C

Small-Mammal Populations in Site 1 and the Control Area,
W75-03414 5C

CENTRIFUGES
Lime Sludge: Some Problems--Some Solutions,
W75-03378 5D

CESIUM
The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies.
W75-03401 5C

The Enterprise Radiation Forest Research Facility,
W75-03402 5C

Predicted Effects of Chronic Gamma Irradiation on Northern Forest Communities,
W75-03410 5C

Small-Mammal Populations in Site 1 and the Control Area,
W75-03414 5C

CHAPARRAL
Chaparral Conversion Potential in Arizona. I. Water Yield Response and Effects on Other Resources,
W75-03572 3B

Chaparral Conversion Potential in Arizona. II. An Economic Analysis,
W75-03573 3B

CHELATION
Gas Chromatography of Volatile Metal Chelates: Application of a New Technique to Metal Analysis in Natural Waters,
W75-03305 5A

Photometric Titration of Beryllium(II) with 5-Sulfosalicylic Acid,
W75-03629 2K

CHEMICAL ANALYSIS
Physiological and Ecological Significance of the Chemical Instability of the Uric Acid and

CHEMICAL ANALYSIS

Related Purines in Sea Water and Marine Algal Culture Medium,
W75-03512 5C

Chemical Analyses for Water Quality - Training Manual.
W75-03785 5A

Determination of the Composition and the Stability Constants of Complexes of Mercury (II) With Amino Acids,
W75-03798 5A

CHEMICAL-BIOLOGICAL TREATMENT
Combined Chemical-Biological Treatment Studies,
W75-03383 5D

CHEMICAL DEGRADATION
Physiological and Ecological Significance of the Chemical Instability of the Uric Acid and Related Purines in Sea Water and Marine Algal Culture Medium,
W75-03512 5C

Light-Energized Oxidation of Organic Wastes,
W75-03578 5D

CHEMICAL OXYGEN DEMAND
Ultrafiltration Offers 'Good' Removal of Color, COD, BOD.
W75-03600 5D

CHEMICAL PRECIPITATION
Process for Waste Water Purification (Verfahren zum Reinigen von Abwasser),
W75-03582 5D

Method of Decolorizing Waste Process Liquid Discharged by a Paper Mill,
W75-03595 5D

Method of Decolorizing Paper Mill Effluent Liquid,
W75-03596 5D

CHEMICAL PROPERTIES
Selected Physicochemical Properties of Basaltic Rocks, Liquids, and Glasses,
W75-03419 8H

The Dissolution of Pu-238 in Environmental and Biological Systems,
W75-03431 5B

CHEMICAL REACTIONS
Estimation Theoretic Approach to Analysis, Synthesis, and Solution of Dynamic Systems, Part II,
W75-03388 5D

Physiological and Ecological Significance of the Chemical Instability of the Uric Acid and Related Purines in Sea Water and Marine Algal Culture Medium,
W75-03512 5C

Hydrogen Evolution on Beta III Titanium Alloy,
W75-03809 2K

CHEMICAL RECOVERY
Pulping Process Prevents Pollution,
W75-03588 5D

CHEMICAL STUDIES
Study of the Hydrographic and Chemical Conditions in the Water of the Lagoon of Tacarigua, (In Spanish),
W75-03335 5B

CHEMICAL TREATMENT
Some Effects of Nitrogen and Phosphorus Limitation on a Biological-Chemical Wastewater Treatment Process,
W75-03543 5D

Treatment of Sewage,
W75-03746 5D

Liquid Waste Treatment,
W75-03754 5D

CHEMICAL WASTES
Nonbiodegradable and Other Recalcitrant Molecules,
W75-03497 5B

Peat: New Medium for Treating Dye House Effluent,
W75-03577 5D

Biochemical Purification of Waste Waters at the Syavsk (Wood-Pyrolysis) Combine (Biokhimicheskaya ochistka stochnykh vod na Syavskom Kombinate),
W75-03606 5D

Decolorizing Dye Wastes,
W75-03608 5D

CHEMICALS
The Role of the Chemical Industry in the Fight Against Water Pollution in the Paper Industry (Role de l'industrie chimique dans la lutte contre la pollution des eaux en papeterie),
W75-03567 5G

CHEMISTRY
Chemistry of Some Sedgeland Waters: Lake Pedder, South-West Tasmania,
W75-03390 5B

CHESAPEAKE BAY
A Check List of the Biota of Lower Chesapeake Bay,
W75-03786 5C

CHICAGO (ILL)
Sources of Phosphorus Inputs from the Atmosphere and Their Significance to Oligotrophic Lakes,
W75-03304 5B

CHINOOK SALMON
Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

CHIRONOMUS-PLUMOSUS
Observations on the Nutrition of Larvae of Chironomus f.l. Plumosus in the Waters of the Danube Flood Area, (In Romanian),
W75-03827 2I

CHLORIDES
An Automated Method for Determination of Chloride and Sulfate in Freshwater Using Cation Exchange and Measurement of Electrical Conductance,
W75-03576 5A

Content of Chemical Substances in Farm Crops Grown on Soil Irrigated with Waste Waters of Coke By-Product Plants, (In Russian),
W75-03846 5B

CHLORINATION
Bacteriology of Chlorinated and Unchlorinated Wastewater Effluents,
W75-03366 5D

Disinfection,
W75-03369 5D

CHROMATOGRAPHY
Separation of Copper (II) from Uranium (VI) and Many Other Elements by Cation-Exchange Chromatography in Acetone-Hydrobromic Acid Media - Improved Selective Separation of Copper,
W75-03628 5A

CHROMIUM
A Study of Adsorption Characteristics of Traces of Chromium(III) and (VI) on Selected Surfaces,
W75-03613 5A

CILIOPHORA
Marine Flora and Fauna of the Northeastern United States. Protozoa: Ciliophora,
W75-03787 5C

CIRCULATION
Remote Sensing of Algal Blooms by Aircraft and Satellite in Lake Erie and Utah Lake,
W75-03760 5A

CISTERNS
Moss Rose Manufacturing Co. v. Foster (Action for Recovery of Water Damage Caused by Seepage).
W75-03455 6E

CIVIL DEFENSE
Evacuation Risks - An Evaluation,
W75-03424 6G

CLAIMS (CONTRACTS)
Schine Enterprises, Inc. v. Askew (Declaratory Judgment Action Concerning Florida Inland Navigation District).
W75-03359 6E

CLASSIFICATIONS
Report of Proceedings at Public Hearing Concerning the Reclassification of Various Streams in the Cape Fear (Lower Section), Lumber, Neuse and White Oak River Basins.
W75-03717 4A

CLIMATES
Some Predicted Climatic Effects of a Simulated Sahara Lake,
W75-03635 2B

CLIMATIC DATA
A One-Dimensional Numerical Model of Precipitation Scavenging With Application to Rainout of Radioactive Debris,
W75-03427 5B

CLOUD SEEDING MODEL
Twelve Basin Investigation: Analysis of Potential Increases in Precipitation and Streamflow Resulting from Modification of Cold Orographic Clouds in Selected River Basins of the Western United States. Volume 2,
W75-03639 3B

COAGULATION
Treatment for Oily Waste Water Using Magnetic Powder, (In Japanese).
W75-03551 5D

Process for Waste Water Purification (Verfahren zum Reinigen von Abwasser),
W75-03582 5D

Liquid Waste Treatment,
W75-03754 5D

COASTAL MARSHES
The Delaware Estuary System, Environmental Impacts and Socio-Economic Effects Delaware River Estuarine Marsh Survey,
W75-03441 6C

State Ex Rel. McLeod V. Murrell's Inlet Camp and Marina, Inc. (Quiet Title Action Involving Riparian Land),

W75-03738 2J

COASTAL WATERS
Perspectives on Coastal Management--Marine Trades and the Coastal Crisis,
W75-03458 6B

Humboldt Harbor and Bay Jetties and Dredging, (Final Environmental Inpact Statement).
W75-03706 4A

COASTAL ZONE MANAGEMENT
Schine Enterprises, Inc. v. Askew (Declaratory Judgment Action Concerning Florida Inland Navigation District).
W75-03359 6E

Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

Perspectives on Coastal Management--Marine Trades and the Coastal Crisis,
W75-03458 6B

Unnatural Shoreline,
W75-03459 5G

Coastal Zone Management in Maine: A Legal Perspective,
W75-03689 6E

COASTS
Perspectives on Coastal Management--Marine Trades and the Coastal Crisis,
W75-03458 6B

The Coastal Upwelling Cycle on a Beta-Plane: Hydrodynamics and Thermodynamics,
W75-03642 2L

COHO SALMON
Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

COLD REGIONS
Growth of Engelmann Spruce (Picea Engelmannii) Unaffected by Increased Snowpack,
W75-03844 2I

COLLOIDS
A Review of Turbidity Removal Associated With Biological Treatment of Paper Mill Wastewaters,
W75-03574 5D

COLOR
Method of Decolorizing Waste Process Liquid Discharged by a Paper Mill,
W75-03595 5D

Method of Decolorizing Paper Mill Effluent Liquid,
W75-03596 5D

Ultrafiltration Offers 'Good' Removal of Color, COD, BOD.
W75-03600 5D

COLORADO
Ground-Water Quality Study,
W75-03534 5B

Compensatory Storage,
W75-03676 6E

COLORADO RIVER BASIN
Compensatory Storage,
W75-03676 6E

COLORIMETRY
Automated Phosphate Analysis in the Presence of Arsenic,
W75-03607 5A

Selective Determination of Iron in Alloys by Reaction with 2,3-Pyridinediol and Ring Colorimetry,
W75-03623 2K

Kinetic-Coulometric Determination of Mercury in Biological Samples,
W75-03627 5A

COMBINATION LIMESTONE-LIME TREATMENT
Combination Limestone-Lime Treatment of Acid Mine Drainage,
W75-03559 5D

COMMERCIAL FISH
Mercury Content of Fish and Shrimps Caught Off the Belgian Coast,
W75-03518 5C

COMMERCIAL FISHING
Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

Regulatory Management Programs for Florida Marine Fishermen,
W75-03487 6E

COMMERCIAL SHELLFISH
Commercial Oyster Fishery Development Investigation,
W75-03350 6C

Recent Developments in the New Zealand Rock Oyster Farming Industry (1970-72) and Problems Regarding Aquatic Pollution,
W75-03516 5C

COMPENSATION
Compensatory Storage,
W75-03676 6E

COMPETING USES
Perspectives on Coastal Management--Marine Trades and the Coastal Crisis,
W75-03458 6B

COMPLEXES (MERCURY)
Determination of the Composition and the Stability Constants of Complexes of Mercury (II) With Amino Acids,
W75-03798 5A

COMPOSTING

DIELDRIN
Organochlorine Insecticide Residues in Sediment and Fish Tissues, Ontario, Canada,
W75-03495 5C

DIET (FISH)
The Biology of a Landlocked Form of the Normally Catadromous Salmoniform Fish Galaxias Maculatus (Jonyns): V. Composition of the Diet,
W75-03597 2H

DIFFUSION
Diffusion of Ions in Sea Water and in Deep-Sea Sediments,
W75-03611 5B

DIGESTER SYSTEMS
Anaerobic Digestion of Organic Matter,
W75-03371 5D

DIGESTION TANKS
Anaerobic Digestion of Organic Matter,
W75-03371 5D

DISCHARGE (WATER)
Beane v. Prince George's County (Action for Damages for Unnatural Water Flow).
W75-03478 6E

DISINFECTION
Disinfection,
W75-03369 5D

Treatment of Sewage,
W75-03746 5D

DISPERSION
Hydrocarbon Dispersion in Ground Water: Significance and Characteristics,
W75-03662 5B

DISSOLVED OXYGEN
Dissolved Oxygen Requirements of Newly-Hatched Larvae of the Striped Blenny (Chasmodes Bosuianus), the Naked Goby (Gobiosoma Bosci), and the Skilletfish (Gobiesox Strumosus),
W75-03519 5C

Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

A Device for Maintaining Constant Oxygen Concentration in Flowing Water,
W75-03522 5G

DISTILLATION
Distillation Apparatus,
W75-03735 3A

Multistage Flash Distillation,
W75-03739 3A

DISTRIBUTION
Perspectives on Coastal Management--Marine Trades and the Coastal Crisis,
W75-03458 6B

Accumulation, Distribution, Transformation and Elimination of DDT-14C in Solea Solea (Pisces: Soleidae), (In German),
W75-03494 5C

DISTRIBUTION PATTERNS
The Nature of Water Potential Gradients in Trees, (In German),
W75-03336 2I

Distribution of Potential Mosquito Vectors in the Imperial Valley, California, 1971-1972,
W75-03498 5G

Mercury in Tunas: A Review,
W75-03622 5C

Fitting a Three-Parameter Log-Normal Distribution by Least Squares,
W75-03651 2E

Determination of Mercury in Commercially Important Aquatic Organisms,
W75-03796 5B

DOLANIA AMERICANA
Temperature Effects on Growth and Respiration Rates of Dolania Americana (Ephemeroptera),
W75-03510 5C

DOMESTIC WASTES
The Use of Pollutants for Aquaculture - Conditioning of Wastes for Aquaculture,
W75-03514 5D

DOVER SOLE
Environmental Aspects of Fin Erosion and Tumors in Southern California Dover Sole,
W75-03517 5C

DRAINAGE BASINS
Unnatural Shoreline,
W75-03459 5G

DRAINAGE EFFECTS
Miller Land Co., Inc. v. Liberty Township (Action for Injunction to Remove Drain Tile and Restore Condition of Land).
W75-03713 6E

DRAINAGE ENGINEERING
Agriculture's Pollution Solution for Lake Apopka,
W75-03686 5C

DRAINAGE PATTERNS (GEOLOGIC)
Study of Drainage Patterns in the Mahanadi Catchment (Above Hirakud Dam),
W75-03835 4D

DRAINAGE SYSTEMS
Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Fifth Annual Report, Year Ended 30th June 1973.
W75-03432 5G

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Second Annual Report Year Ended June 1970.
W75-03433 5G

Columbia Drainage and Levee District No 3, Monroe County, Illinois (Final Environmental Statement),
W75-03452 4A

DREDGE SPOIL DISPOSAL
Guidelines for Development of Criteria for Control of Ocean Waste Disposal.
W75-03632 5E

DREDGING
Rivers, Streams and Brooks--Alteration.
W75-03698 6E

Humboldt Harbor and Bay Jetties and Dredging, (Final Environmental Inpact Statement).
W75-03706 4A

Yonge V. Askew (Certiorari to Review Denial of Application to Dredge Navigable Waters),
W75-03711 6E

DRIFT (SEA ICE)
Differential Sea-Ice Drift. I. Spatial and Temporal Variations in Sea-Ice Deformation,
W75-03649 2C

Differential Sea-Ice Drift. II. Comparison of Mesoscale Strain Measurements to Linear Drift Theory Predictions,
W75-03650 2C

DRY MATTER PRODUCTION
Response of Mycorrhizal and Nonmycorrhizal Rooted Cuttings of Heather (Calluna Vulgaris(L.) Hull) to Variations in Nutrient and Water Regimes,
W75-03842 3F

DRYING
Static Pressure Fractionation Characteristics of Water Hyacinth,
W75-03302 4A

DUNALIELLA
Accumulation Experiments with Lindane in a Culture of Dunaliella for Standardization of an Algae Test. (Akkumulationsversuche von Linden in einer Kulter von Dunnaliella spec. zur Standarisierung eines Algentestes),
W75-03508 5C

DWARF WHEATS
Productivity in Dwarf Wheats in a Silt-Loam Soil as Influenced by Soil-Moisture Regimes and Nitrogen Fertilization Under Shallow Water Table Conditions,
W75-03557 3F

DYES
Peat: New Medium for Treating Dye House Effluent,
W75-03577 5D

Decolorizing Dye Wastes,
W75-03608 5D

E COLI
Bacteriophages as Viral Pollution Indicators,
W75-03816 5A

EARTHQUAKES
A Geological and Seismological Investigation of the Lawrence Livermore Laboratory Site,
W75-03429 5B

EAST BRIMFIELD DAM (MASS)
East Brimfield and Westville Reservoirs. Quantity and Value of Water Supply Storage. Quinebaug River--Massachusetts.
W75-03437 6D

ECOLOGICAL DISTRIBUTION
Temporal and Spatial Patterns of Pretreatment Litter Production in Site 1 and the Control Area,
W75-03411 5C

A Check List of the Biota of Lower Chesapeake Bay,
W75-03786 5C

ECOLOGY
Changes in the Economy and Ecology at Proposed Lake Sites in the Salt River Basin, Kentucky, During Early Construction of the Dam for Taylorsville Lake,
W75-03309 5C

The Enterprise Radiation Forest Research Facility,
W75-03402 5C

Flora of the Enterprise Radiation Forest,
W75-03406 5C

Translations on Environmental Quality, No. 7.
W75-03486 6E

Observations on the Ecology of Lacrustrine Populations of the Threespine Stickleback (Gasterosteus Aculeatus L., 1758) in the Matamek River System, Quebec,
W75-03625 5C

Ecology and the Problem of Rehabilitating Wastes from Mineral Extraction,
W75-03626 5G

Translations on Environmental Quality No. 8.
W75-03696 5G

Ecology of River Narmada Upper Catchment Area in Central India: I. Introduction, Situation, Terrain, Lithology, Climate, General Forests and Methods of Vegetational Analysis,
W75-03826 4D

ECONOMIC ASPECTS
Inland Lakes Protection and Rehabilitation.
W75-03730 6E

ECONOMIC EFFICIENCY
On Taxation as a Pollution Control Policy,
W75-03329 5G

A Performance Study of Aerobic Sludge Digestion,
W75-03773 5D

ECONOMIC FEASIBILITY
The Transition from Small-Scale to Large-Scale Industry,
W75-03351 6C

ECONOMIC IMPACT
Economic Development and Water Resources Investments,
W75-03343 6B

Environmental Pollution in a Rapidly Growing Economy,
W75-03353 6G

The Economic Effects of the 1971 Florida Red Tide and the Damage it Presages for Future Occurrences,
W75-03393 5G

Alternatives in Aquacultural Development: Consideration of Extensive Versus Intensive Methods,
W75-03398 6B

Perspectives on Coastal Management--Marine Trades and the Coastal Crisis,
W75-03458 6B

Federal Action for Environmental Protection and Its Potential Significance for Housing.
W75-03485 6E

CONOMIC IMPACTS
Distributional Impacts of Environmental Management: Federal Grants for Water Pollution Control,
W75-03354 5G

CONOMIC JUSTIFICATION
Chaparral Conversion Potential in Arizona. II. An Economic Analysis,
W75-03573 3B

COSYSTEMS
Energy Evaluation of Water Management Alternatives in the Upper St. Johns River Basin of Florida,
W75-03436 6A

Snail Population in Running Water,
W75-03803 2I

COTYPES
Heavy Metal Tolerance in Typha Latifolia Without the Evolution of Tolerant Races,
W75-03513 5C

FFLUENT LIMITATIONS
Regulation of Great Lakes Water Levels--Appendix G--Regulatory Works--Report to the International Joint Commission.
W75-03682 4A

Water Quality Mangement Plans--Proposed Rules.
W75-03718 6E

FFLUENTS
Mill Effluent and its Utilisation for Crop Cultivation Purposes,
W75-03585 5D

LECTRIC POWER DEMAND
Electric Energy Requirements for Environmental Protection,
W75-03399 6D

LECTRICAL CONDUCTANCE
An Automated Method for Determination of Chloride and Sulfate in Freshwater Using Cation Exchange and Measurement of Electrical Conductance,
W75-03576 5A

LECTRICAL EQUIPMENT
A simple Device for Analyzing the Energy Load and Intensity of Rainstorms,
W75-03838 2B

ELECTROLYTES
On the Choice of Methods for the Prediction of the Water-Activity and Activity Coefficient for Multicomponent Aqueous Solutions,
W75-03540 2K

EMBANKMENTS
Structural Behavior of a Flexible Metal Culvert Under a Deep Earth Embankment Using Method A Backfill,
W75-03641 8D

EMULSIONS
Oil-In-Water Emulsions and Their Flow Properties in Porous Media,
W75-03812 8B

ENDRIN
Preliminary Experiments on the Effect of Thiodan and Endrin on Fish Culture in Indonesia,
W75-03515 5C

ENERGY
Electric Energy Requirements for Environmental Protection,
W75-03399 6D

Energy Evaluation of Water Management Alternatives in the Upper St. Johns River Basin of Florida,
W75-03436 6A

ENERGY BUDGET
Calculation of Temperature Variations of Small Mountain Streams,
W75-03655 2E

ENERGY CONSUMPTION
Legal and Ecological Aspects of the International Energy Situation,
W75-03490 6G

ENERGY PRODUCTION
Legal and Ecological Aspects of the International Energy Situation,
W75-03490 6G

ENFORCEMENT
People v. Oceana Terminal Corp. (Prosecution for an Oil Spill).
W75-03456 6E

The New Federal Water Pollution Control Law,
W75-03715 5G

ENGINEERING STRUCTURES
Regulation of Great Lakes Water Levels--Appendix G--Regulatory Works--Report to the International Joint Commission.
W75-03682 4A

ENTERIC BACTERIA
Bacteriophages as Viral Pollution Indicators,
W75-03816 5A

ENTERPRISE RADIATION FOREST
The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies.
W75-03401 5C

ENTOBACTERIN
Effect of Biotic and Abiotic Factors on the Toxicity of Entobacterin for Larvae of Blood-Sucking Mosquitoes and Biting Midges, (In Russian),
W75-03845 5C

ENVIRONMENTAL CONTROL
A Survey of International Customary Rules of Environmental Protection,
W75-03453 5G

Federal Action for Environmental Protection and Its Potential Significance for Housing.
W75-03485 6E

Translations on Environmental Quality, No. 7.

Floating Water Screen,
W75-03745 8I

FISH CONTROL AGENTS
Toxicity of 2-(Digeranylamino)-Ethanol, A Candidate Selective Fish Toxicant,
W75-03509 5C

FISH DISEASES
Environmental Aspects of Fin Erosion and Tumors in Southern California Dover Sole,
W75-03517 5C

FISH FARMING
Preliminary Experiments on the Effect of Thiodan and Endrin on Fish Culture in Indonesia,
W75-03515 5C

FISH FOOD ORGANISMS
Food Selection by Labeorohita (Ham.) and Its Feeding Relationship with Other Major Carps,
W75-03496 8I

FISH GROWTH
Marine Fish Culture in Britain: IX. Growth of Cultured Plaice to Marketable Size in the Laboratory,
W75-03759 8I

FISH MANAGEMENT
Financing Resources for Fishery Development,
W75-03339 6C

Expansion and Evaluation of an Artificial Reef Off Murrell's Inlet, South Carolina,
W75-03348 6C

The Transition from Small-Scale to Large-Scale Industry,
W75-03351 6C

The Role of Aquaculture in Fishery Development and Management,
W75-03355 6C

Reconciling Conflicts Among Different Economic Interest Groups in the Management of Fisheries,
W75-03392 6B

Alternatives in Aquacultural Development: Consideration of Extensive Versus Intensive Methods,
W75-03398 6B

Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

Regulatory Management Programs for Florida Marine Fishermen,
W75-03487 6E

Marine Fish Culture in Britain: IX. Growth of Cultured Plaice to Marketable Size in the Laboratory,
W75-03759 8I

FISH PHYSIOLOGY
Temperature Effect on Brain Glycogen of Fish,
W75-03447 5C

FISH PONDS
Observations on a Breeding Pair of Tilapia Rendalli Rendalli Boulenger 1896 in an Experimental Tank at Lake Kariba Fisheries Research Institute,
W75-03501 8I

FISH POPULATIONS
U.S. v. Cappaert (Action by U.S. to Have its Rights to Use of Appurtenant Waters Declared).
W75-03723 6E

FISH SCREENS
Floating Water Screen,
W75-03745 8I

FISH TISSUE
Organochlorine Insecticide Residues in Sediment and Fish Tissues, Ontario, Canada,
W75-03495 5C

FISH TRANSFER PONDS
The Plankton of New Transfer-Ponds at the Golysz Farm,
W75-03502 8I

FISHERIES
1971 Salmon River Estuary Resource Use Study,
W75-03344 6C

1971 Sand Lake Estuary Resource Use Study,
W75-03345 6C

1971 Alsea River Estuary Resource Use Study,
W75-03346 6C

The Transition from Small-Scale to Large-Scale Industry,
W75-03351 6C

Reconciling Conflicts Among Different Economic Interest Groups in the Management of Fisheries,
W75-03392 6B

Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

FISHERIES FINANCING
Financing Resources for Fishery Development,
W75-03339 6C

FISHERY DEVELOPMENT
Financing Resources for Fishery Development,
W75-03339 6C

FISHING
Expansion and Evaluation of an Artificial Reef Off Murrell's Inlet, South Carolina,
W75-03348 6C

State University System of Florida Sea Grant Program 1972.
W75-03714 6

FISHING INDUSTRY
The Transition from Small-Scale to Large-Scale Industry,
W75-03351 6C

FLASH DISTILLATION
Wastewater Degassing by Adiabatic Flashing,
W75-03446 5

Multistage Flash Distillation,
W75-03739 3

New Multi-Probe Temperature-Profile Measurement System--The 'Thermistor Comb',
W75-03811 7

FLIES
Manure Stack Fly Breeding Depends on the Amount of Manure Added Daily,
W75-03815 5B

FLOATING
Method and Apparatus for Recovering a Substance Floating as a Sheet on the Surface of a Liquid Mass,
W75-03449 5G

FLOATING CITY
Hawaii's Floating City Development Program. Structural Sizing of Flotation Modules and Construction Barge,
W75-03442 8A

Hawaii's Floating City Development Program. Construction Site Selection,
W75-03443 8A

FLOCCULANT
Lime Sludge: Some Problems--Some Solutions,
W75-03378 5D

FLOCCULATION
Treatment of Industrial Effluents by Flotation (Traitement d'effluents industriels par flottation),
W75-03569 5D

Process for Waste Water Purification (Verfahren zum Reinigen von Abwasser),
W75-03582 5D

Novel Methods of Freshwater Preparation and Waste Water Purification in Pulp and Paper Mills (Neuere Methoden zur Frischwasseraufbereitung und Abwasserreinigung in Zellstoff- und Papierfakriken),
W75-03602 5D

Liquid Waste Treatment,
W75-03754 5D

Waste Water Purification System,
W75-03755 5D

FLOOD CONTROL
Rapid Creek Flood Hazard Analyses-(Including Inman Creek and West Fork Creek Tributaries) Bannock County, Idaho.
W75-03438 4A

Flood Hazard Analyses - City of Lisbon, Ransom County, North Dakota.
W75-03439 4A

A. H. Smith Sand and Gravel Co. v. Dept. of Water Resources (Action Dealing With Filling Operations in Floodplain).
W75-03464 6E

Cappture Realty Corp. v. Board of Adjustment (Suit Challenging Denial of Special Exception Use--Construction in Flood Plains).
W75-03467 6E

FLOOD DATA
Rapid Creek Flood Hazard Analyses-(Including Inman Creek and West Fork Creek Tributaries) Bannock County, Idaho.
W75-03438 4A

FLOOD PLAIN
A. H. Smith Sand and Gravel Co. v. Dept. of Water Resources (Action Dealing With Filling Operations in Floodplain).
W75-03464 6E

FLOOD PLAIN MANAGEMENT
Flood Hazard Analyses - City of Lisbon, Ransom County, North Dakota.
W75-03439 4A

FLOOD PLAIN ZONING
Rapid Creek Flood Hazard Analyses-(Including Inman Creek and West Fork Creek Tributaries) Bannock County, Idaho.
W75-03438 4A

A. H. Smith Sand and Gravel Co. v. Dept. of Water Resources (Action Dealing With Filling Operations in Floodplain).
W75-03464 6E

Cappture Realty Corp. v. Board of Adjustment (Suit Challenging Denial of Special Exception Use--Construction in Flood Plains).
W75-03467 6E

FLOOD PLAINS
Cappture Realty Corp. v. Board of Adjustment (Suit Challenging Denial of Special Exception Use--Construction in Flood Plains).
W75-03467 6E

FLOOD PROFILES
Rapid Creek Flood Hazard Analyses-(Including Inman Creek and West Fork Creek Tributaries) Bannock County, Idaho.
W75-03438 4A

FLOOD PROTECTION
Flood Hazard Analyses - City of Lisbon, Ransom County, North Dakota.
W75-03439 4A

FLOODS
Musumeci v. State (Action by Downstream Landowners to Recover Flooding Damages Caused by Relocation of Highway).
W75-03469 6E

FLORIDA
Schine Enterprises, Inc. v. Askew (Declaratory Judgment Action Concerning Florida Inland Navigation District).
W75-03359 6E

Canal Authority of State of Florida v. Callaway (Injunction to Stop Construction).
W75-03360 6E

Environmental Law--Oil Pollution Control--in the Absence of Federal Preemption and Any Fatal Conflict Between Statutory Schemes, a State May Constitutionally Exercise its Police Power to Provide for Cleanup of Oil Spillage and for Recoupement of Costs Concurrently With the Federal Government,
W75-03365 5G

The Economic Effects of the 1971 Florida Red Tide and the Damage it Presages for Future Occurrences,
W75-03393 5G

Energy Evaluation of Water Management Alternatives in the Upper St. Johns River Basin of Florida,
W75-03436 6A

United States v. Raven (Appeal from Conviction for Failing to Remove Sunken Vessel and Obstructing Navigable Waterway).
W75-03462 6E

Askew v. Taylor (Action for Equitable Relief Against State Following Denial of Application for Dredge and Fill Permits for Bottomlands).
W75-03482 6E

Di Vosta Rentals Inc. v. Lee (Review of Denial of Fill Permit).
W75-03492 6E

Yonge V. Askew (Certiorari to Review Denial of Application to Dredge Navigable Waters),
W75-03711 6E

State University System of Florida Sea Grant Program 1972.
W75-03714 6E

Sea Grant Program 1973, State University System of Florida.
W75-03720 9A

Pollutant Spill Prevention and Control Act (As Amended).
W75-03728 6E

Pollution Control Awards Program.
W75-03731 6E

FLORIDA (LOXAHATCHEE NATIONAL WILDLIFE REFUGE)
Monitoring 2,4-D Residues at Loxahatchee National Wildlife Refuge,
W75-03506 5A

FLOTATION
Study of the Removal of Copper Ion and Cadmium Ion from Waste Water by Flotation Method Utilizing Xanthate, (In Japanese),
W75-03552 5D

Treatment of Industrial Effluents by Flotation (Traitement d'effluents industriels par flottation),
W75-03569 5D

Process for Waste Water Purification (Verfahren zum Reinigen von Abwasser),
W75-03582 5D

Novel Methods of Freshwater Preparation and Waste Water Purification in Pulp and Paper Mills (Neuere Methoden zur Frischwasseraufbereitung und Abwasserreinigung in Zellstoff- und Papierfakriken),
W75-03602 5D

FLOTSAM
Rotary Skimmer,
W75-03736 5G

FLOW AUGMENTATION
Columbia Drainage and Levee District No 3, Monroe County, Illinois (Final Environmental Statement),
W75-03452 4A

FLUID MECHANICS
Talking Tankers.
W75-03560 5E

FLUORESCENCE
The Determination of Arsenic by Non-Dispersive Atomic Fluorescence Spectrometry with a Gas Sampling Technique,
W75-03612 5A

FLUORSPAR
Determination of Mercury in Fluorspar Mining Survey Samples,
W75-03794 5A

FLUTES
Observations on the Internal Structure and Origin of Some Flutes in Glacio-Fluvial Sediments, Blomstrandbreen, North-West Spitsbergen,
W75-03647 2C

FOAMING
New Concepts for Clarification of Water Using Some Alternatives to Alum,
W75-03374 5D

FOOD CHAINS
Accumulation Experiments with Lindane in a Culture of Dunaliella for Standardization of an Algae Test. (Akkumulationsversuche von Linden in einer Kulter von Dunnaliella spec. zur Standarisierung eines Algentestes),
W75-03508 5C

FORAGE GRASSES
Production and Utilization of Fodder and Grain Sorghum as Forage for Cattle in the Ord River Valley, Western Australia,
W75-03830 3F

FORAGE SORGHUM
Production and Utilization of Fodder and Grain Sorghum as Forage for Cattle in the Ord River Valley, Western Australia,
W75-03830 3F

FORECASTING
Relationships Between Moisture Availability and Nitrogen Response in Winter Wheat,
W75-03307 3F

Predicted Effects of Chronic Gamma Irradiation on Northern Forest Communities,
W75-03410 5C

The Problem of Determining the Maximum Storm Runoff Yield in Small Rivers (In problema determinarii debitelor maxime din ploi pe riuri mici),
W75-03535 2A

FOREST FIRES
Watershed Behavior After Forest Fire in Washington,
W75-03820 4C

Firt Year Vegetation After Fire, Reseeding, and Fertilization on the Entiat Experimental Forest,
W75-03823 4D

FOREST MANAGEMENT
The Enterprise Radiation Forest Research Facility,
W75-03402 5C

Solar Radiation Measurements in the Enterprise Radiation Forest,
W75-03404 5C

Lichens of the Enterprise Radiation Forest,
W75-03405 5C

Flora of the Enterprise Radiation Forest,
W75-03406 5C

Water: Its Quality Often Depends on the Forester,
W75-03589 5B

Microclimate and Thermal Stress of Man in an Aleppo Pine Plantation and an Oak Scrub,
W75-03834 2I

FOREST TUNDRA
Snow-Vegetation Relationships in the Forest Tundra of Nouveau-Quebec, Hudson Bay, (In French),
W75-03849 2I

FOREST WATERSHEDS
Watershed Behavior After Forest Fire in Washington,
W75-03820 4C

FORESTS
The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies.
W75-03401 5C

Description and Classification of Plant Communities in Site 1 and the Control Area,
W75-03407 5C

Physical Condition and Dimensions of Trees in Site 1 and the Control Area,
W75-03408 5C

Properties of the Tree Flora in the Forest Transition from Aspen to Maple-Birch Type,
W75-03409 5C

Predicted Effects of Chronic Gamma Irradiation on Northern Forest Communities,
W75-03410 5C

Temporal and Spatial Patterns of Pretreatment Litter Production in Site 1 and the Control Area,
W75-03411 5C

Vertebrates of the Enterprise Forest: A General Survey,
W75-03413 5C

Rainfall Interception in a Forest in the Velen Hydrological Representative Basin,
W75-03654 2I

FRESHWATER MARSHES
Tacna Marsh. Natural Area Report No. 35,
W75-03400 6B

FROTH FLOTATION
Recycling Milling Water in Missouri's New Lead Belt,
W75-03799 5D

FRY
Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

FUEL REPROCESSING
Argonne National Laboratory, Waste Management Programs Quarterly Report, October-December 1973,
W75-03415 5D

FUEL REPROCESSING WASTES
Storage of Tritium and Noble Gases,
W75-03418 5D

FUELS
Consolidation Techniques for Fuel Cladding Hulls,
W75-03416 5D

FUNCTIONAL TRANSFORM
Fitting a Three-Parameter Log-Normal Distribution by Least Squares,
W75-03651 2E

FUNGI
Lichens of the Enterprise Radiation Forest,
W75-03405 5C

Removal of Resin Acids from Culture Media and Kraft-Mill Effluents by Yeasts and Some Other Fungi,
W75-03599 5D

FUNGICIDES
Mercury Levels in Fishes from Some Missouri Lakes With and Without Known Mercury Pollution,
W75-03323 5B

FWPCA AMENDMENTS OF 1972
Explanatory Statement: Implementation of NPDES, (EPA).
W75-03693 5G

GALAXIAS-MACULATUS
The Biology of a Landlocked Form of the Normally Catadromous Salmoniform Fish Galaxias Maculatus (Jonyns): V. Composition of the Diet,
W75-03597 2H

GAMMA RADIATION
The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies.
W75-03401 5C

GAS BUBBLE DISEASE
Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

GAS CHROMATOGRAPHY
Gas Chromatography of Volatile Metal Chelates: Application of a New Technique to Metal Analysis in Natural Waters,
W75-03305 5A

GENETICS
Lichens of the Enterprise Radiation Forest,
W75-03405 5C

Description and Classification of Plant Communities in Site 1 and the Control Area,
W75-03407 5C

Temporal and Spatial Patterns of Pretreatment Litter Production in Site 1 and the Control Area,
W75-03411 5C

GEOGRIA
Evaluation of the Georgia Water Supply Program.
W75-03435 5F

GEOLOGIC INVESTIGATIONS
A Geological and Seismological Investigation of the Lawrence Livermore Laboratory Site,
W75-03429 5B

GEOLOGY
A Study: Effects of Geology and Nutrients on Water Quality Development,
W75-03539 5G

GEOMORPHOLOGY
Observations on the Internal Structure and Origin of Some Flutes in Glacio-Fluvial Sediments, Blomstrandbreen, North-West Spitsbergen,
W75-03647 2C

Subglacial Geomorphology Surrounding the Ice-Free Valleys of Southern Victoria Land, Antarctica,
W75-03667 2C

GEORGIA
Temperature Effects on Growth and Respiration Rates of Dolania Americana (Ephemeroptera),
W75-03510 5C

Groundwater Use Act of 1972.
W75-03722 6E

Water Recreation Act of 1973.
W75-03726 6E

GEOTHERMAL HEAT
Power Generation From Hot Brines,
W75-03737 4B

GEOTHERMAL WELLS
Power Generation From Hot Brines,
W75-03737 4B

GLACIAL SEDIMENTS
Observations on the Internal Structure and Origin of Some Flutes in Glacio-Fluvial Sediments, Blomstrandbreen, North-West Spitsbergen,
W75-03647 2C

GLACIATION
Advance of the Greenland Ice Sheet on to North-Eastern Ellesmere Island,
W75-03645 2C

Observations on the Internal Structure and Origin of Some Flutes in Glacio-Fluvial Sediments, Blomstrandbreen, North-West Spitsbergen,
W75-03647 2C

GLACIERS
A Study of Glacier Flow for an Open-Pit Mine: An Exercise in Applied Glaciology,
W75-03663 2C

Multivariate Statistical Analysis of Glacier Annual Balances,
W75-03664 2C

Variations in the Sliding of a Temperate Glacier,
W75-03666 2C

Subglacial Geomorphology Surrounding the Ice-Free Valleys of Southern Victoria Land, Antarctica,
W75-03667 2C

GLACIOLOGY
Advance of the Greenland Ice Sheet on to North-Eastern Ellesmere Island,
W75-03645 2C

A Study of Glacier Flow for an Open-Pit Mine: An Exercise in Applied Glaciology,
W75-03663 2C

Multivariate Statistical Analysis of Glacier Annual Balances,
W75-03664 2C

Variations in the Sliding of a Temperate Glacier,
W75-03666 2C

GLASSES
Selected Physicochemical Properties of Basaltic Rocks, Liquids, and Glasses,
W75-03419 8H

GOLDFISH
Temperature Effect on Brain Glycogen of Fish,
W75-03447 5C

GOLDSTREAM VALLEY (ALAS)
Soil Moisture-Vegetation-Temperature Relationships in Central Alaska,
W75-03657 2G

GOLF GREENS DRAINAGE
Mercury Levels in Fishes from Some Missouri Lakes With and Without Known Mercury Pollution,
W75-03323 5B

GOVERNMENT FINANCE
Distributional Impacts of Environmental Management: Federal Grants for Water Pollution Control,
W75-03354 5G

State of Minnesota V. Environmental Protection Agency (Action of Impoundment of FWPCA Funds),
W75-03705 6E

Kentucky Pollution Abatement Authority,
W75-03707 6E

State University System of Florida Sea Grant Program 1972.
W75-03714 6E

Sea Grant Program 1973, State University System of Florida.
W75-03720 9A

GOVERNMENTAL INTERRELATIONS
Winnipesaukee River Basin Control.
W75-03690 6E

GRAIN CROPS
Water Conservation in Three Grain Crops in the Zambezi Valley,
W75-03332 3F

GRAIN SORGHUM
Production and Utilization of Fodder and Grain Sorghum as Forage for Cattle in the Ord River Valley, Western Australia,
W75-03830 3F

GRANITES
Effect of Fluid Content on the Mechanical Properties of Westerly Granite,
W75-03428 5B

GRANTS
Distributional Impacts of Environmental Management: Federal Grants for Water Pollution Control,
W75-03354 5G

GRAPHICAL ANALYSIS
Use of Interactive Computer Graphics in Water Resources Planning and Management,
W75-03301 6A

GRAPHICAL TECHNIQUES
Use of Interactive Computer Graphics in Water Resources Planning and Management,
W75-03301 6A

GREAT LAKES
Great Lakes-St. Lawrence Seaway System and the Mid-Continent Economy,
W75-03394 6B

Great Lakes Water Quality, 1973 Annual Report to the International Joint Commission.
W75-03640 5G

Regulation of Great Lakes Water Levels--Appendix G--Regulatory Works--Report to the International Joint Commission.
W75-03682 4A

GREAT LAKES REGION
The Enterprise, Wisconsin, Radiation Forest - Preirradiation Ecological Studies.
W75-03401 5C

Predicted Effects of Chronic Gamma Irradiation on Northern Forest Communities,
W75-03410 5C

GREAT PLAINS
Nitrogen Budgets of Great Plains Impoundments,
W75-03758 5C

GREENLAND (ISUA)
A Study of Glacier Flow for an Open-Pit Mine: An Exercise in Applied Glaciology,
W75-03663 2C

GROUNDWATER
Influence of Fertilizer Practices on Water and the Quality of the Environment (Phase II),
W75-03315 5B

Mehling v. Deines (Action to Compel Defendant to Reopen Ditch to Provide Proper Drainage).
W75-03475 6E

Proposed Legislation for Artificial Groundwater Recharge,
W75-03489 4B

Ground-Water Quality Study,
W75-03534 5B

Ground-Water Quality Modeling,
W75-03661 5B

Power Generation From Hot Brines,
W75-03737 4B

Reclamation of Hydrocarbon Contaminated Ground Waters,
W75-03750 5D

Oil-In-Water Emulsions and Their Flow Properties in Porous Media,
W75-03812 8B

Evaluating Well Construction, (Part II),
W75-03813 5B

GROUNDWATER MOVEMENT
Estimation of Groundwater Accession to and Evaporation from a South Australian Lake Using Environmental Tritium,
W75-03528 2H

Hydrocarbon Dispersion in Ground Water: Significance and Characteristics,
W75-03662 5B

GROUNDWATER RESOURCES
A Program for the Future--Water and Sewer in Rural America.
W75-03488 5D

GROWTH RATES
Population Growth, Resource Availability and Environmental Quality,
W75-03331 6B

Temperature Effects on Growth and Respiration Rates of Dolania Americana (Ephemeroptera),
W75-03510 5C

Effect of Water on Bacterial Multiplication in Plant Tissue,
W75-03831 5C

Population Dynamics of Hoplolaimus Sp. at Various Levels of Soil Moisture,
W75-03832 5C

Growth of Engelmann Spruce (Picea Engelmannii) Unaffected by Increased Snowpack,
W75-03844 2I

GYMNODINIUM
The Economic Effects of the 1971 Florida Red Tide and the Damage it Presages for Future Occurrences,
W75-03393 5G

HABITATS
Description of Experimental Plot Design of Site 1 and the Control Area,
W75-03403 5C

HARBORS
Humboldt Harbor and Bay Jetties and Dredging, (Final Environmental Inpact Statement).
W75-03706 4A

HARDNESS (WATER)
Determination of Total Water Hardness by Conductometric Titration with Complexing Agents (Determinarea duritatii toale a apei prin titrari conductometrice cu complexoni),
W75-03604 5A

HARMONIC ANALYSIS
On the Variability of Seasonal Parameters in Hydrologic Time Series,
W75-03658 2E

HARVESTING
Aquatic Weed Harvesting Costs and Equipment--1972,
W75-03391 4A

HATCHET BROOK WATERSHED (MASS)
East Brimfield and Westville Reservoirs. Quantity and Value of Water Supply Storage. Quinebaug River--Massachusetts.
W75-03437 6D

HAWAII
Commercial Oyster Fishery Development Investigation,
W75-03350 6C

Hawaii's Floating City Development Program. Structural Sizing of Flotation Modules and Construction Barge,
W75-03442 8A

Hawaii's Floating City Development Program. Construction Site Selection,
W75-03443 8A

HAZARDOUS SUBSTANCES (POLLUTION)
People v. Oceana Terminal Corp. (Prosecution for an Oil Spill).
W75-03456 6E

Advisory Report on Health Effects of Nitrates in Water.
W75-03484 5C

HAZARDS
Evacuation Risks - An Evaluation,
W75-03424 6G

HEAD LOSS
Hydrodynamic Effects on Flow Through Screens at Intakes,
W75-03659 8B

HEAT EXCHANGERS
Power Generation From Hot Brines,
W75-03737 4B

HEAT FLOW
Power Generation From Hot Brines,
W75-03737 4B

HEAT TRANSFER
Power Generation From Hot Brines,
W75-03737 4B

HEATHER
Response of Mycorrhizal and Nonmycorrhizal Rooted Cuttings of Heather (Calluna Vulgaris(L.) Hull) to Variations in Nutrient and Water Regimes,
W75-03842 3F

HEAVE EFFECTS
Anti-Heave Protective System,
W75-03732 8B

HEAVY METALS
Liquid Waste Treatment Method Using Microorganism as Adsorbent (Biseibutsu o kyuchakuzai to shita haisui shoriho),
W75-03367 5D

Heavy Metal Tolerance in Typha Latifolia Without the Evolution of Tolerant Races,
W75-03513 5C

Peat: New Medium for Treating Dye House Effluent,
W75-03577 5D

Removal of Trace Metals from Waste Water by Treatment with Lime and Discarded Automotive Tires,
W75-03591 5D

A Study of Adsorption Characteristics of Traces of Chromium(III) and (VI) on Selected Surfaces,
W75-03613 5A

Atomic Absorption Spectrophotometric Determination of Microgram Levels of CO, NI, CU, PB, and ZN in Soil and Sediment Extracts Containing Large Amounts of MN and FE,
W75-03618 5A

Kinetic-Coulometric Determination of Mercury in Biological Samples,
W75-03627 5A

Comparative Studies of the Toxicity of Heavy Metals to Phytoplankton and Their Synergistic Interactions,
W75-03775 5C

Heavy Metal Tolerance in Algae Isolated from Polluted Lakes Near the Sudbury, Ontario Smelters,
W75-03781 5C

Method for Determination of Selenium, Arsenic, Zinc, Cadmium, and Mercury in Environmental Matrices by Neutron Activation Analysis,
W75-03792 5A

Hydrometallurgy,
W75-03793 3E

Heavy Metal Contents in Taiwan's Cultured Fish,
W75-03850 5A

HEMLOCK
Hydration of Eastern Hemlock as Influenced by Waxing and Weather,
W75-03500 2I

HERBACEOUS PLANTS
Changes in Stem Diameter of Herbaceous and Woody Plants as a Measure of Internal Water Balance,
W75-03840 2I

HERBICIDES
Mobility and Deactivation of Herbicides in Soil-Water Systems,
W75-03314 5B

Determination of N,N-Dialkyl Dithiocarbamates in Waste Water by Thin-Layer Densitometry,
W75-03537 5A

Water: Its Quality Often Depends on the Forester,
W75-03589 5B

HIERARCHICAL MODELING
Multilevel Approach for Regional Water Resources Planning and Management, Volume I,
W75-03434 6A

HIGHWAY RELOCATION
Musumeci v. State (Action by Downstream Landowners to Recover Flooding Damages Caused by Relocation of Highway).
W75-03469 6E

HISTOGRAMS
Fitting a Three-Parameter Log-Normal Distribution by Least Squares,
W75-03651 2E

HONOLULU (HAWAII)
Hawaii's Floating City Development Program. Structural Sizing of Flotation Modules and Construction Barge,
W75-03442 8A

HUMAN HAIR
On the Lead Content of Human Hair (1871-1971),
W75-03789 5A

HUMAN PATHOLOGY
Epidemiological Survey of Workers Exposed to Cadmium, Effect on Lung, Kidney, and Several Biological Indices,
W75-03795 5C

HUMAN PHYSIOLOGY
Epidemiological Survey of Workers Exposed to Cadmium, Effect on Lung, Kidney, and Several Biological Indices,
W75-03795 5C

HUMAN POPULATION
Displacement of Persons by Major Public Works, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures---Phase 5,
W75-03308 6

HUMBOLDT BAY (CALIF)
Humboldt Harbor and Bay Jetties and Dredging, (Final Environmental Inpact Statement).
W75-03706 4

HUNGARY
On the Spring Maximum of the Concentration of Trace Constituents in Atmospheric Precipitation,
W75-03621 5

HYDRATION
Hydration of Eastern Hemlock as Influenced by Waxing and Weather,
W75-03500

HYDRAULIC CONDUCTIVITY
Determination of Liquid Conductivity of Capillary Porous Solids,
W75-03532

HYDRAULIC STRUCTURES
Hawaii's Floating City Development Program. Structural Sizing of Flotation Modules and Construction Barge,

Mehling v. Deines (Action to Compel Defendant to Reopen Ditch to Provide Proper Drainage).
W75-03475 6E

NEEDLE WATER POTENTIAL
Effects of Thinning on Needle Water Potential in Red Pine,
W75-03499 2I

NEGLIENCE
United States v. Chesapeake and Delaware Shipyard, Inc. (Suit by Government to Recover Under the 'Wreck Act').
W75-03358 6E

NEMATODES
Population Dynamics of Hoplolaimus Sp. at Various Levels of Soil Moisture,
W75-03832 5C

NEPHELOMETRIC METHODS
Automatic Dosage of Sulfates by an Improved Nephelometric Method (Dosage Automatique des Sulfates par une Methode Nephelometrique Amelioree),
W75-03536 5A

NETWORKS
Binary Tree Model Simulation of the Behavior of Urban Hydrologic Systems,
W75-03541 2A

NEUTRALIZATION
Combination Limestone-Lime Treatment of Acid Mine Drainage,
W75-03559 5D

NEUTRON ACTIVATION ANALYSIS
Cadmium Uptake by Wheat from Sewage Sludge Used as a Plant Nutrient Source: A Comparative Study Using Flameless Atomic Absorption and Neutron Activation Analysis,
W75-03503 5A

Rare Earth Elements in Ferromanganese Nodules and Other Marine Phases,
W75-03615 5B

Method for Determination of Selenium, Arsenic, Zinc, Cadmium, and Mercury in Environmental Matrices by Neutron Activation Analysis,
W75-03792 5A

NEVADA
National Environmental Research Center - Las Vegas: A Staff Study,
W75-03347 5A

U.S. v. Cappaert (Action by U.S. to Have its Rights to Use of Appurtenant Waters Declared).
W75-03723 6E

NEW ENGLAND
Marine Flora and Fauna of the Northeastern United States. Protozoa: Ciliophora,
W75-03787 5C

NEW HAMPSHIRE
Purification of Aphanizomenon flos-aquae Toxin and Its Chemical and Physiological Properties,
W75-03324 5C

Winnipesaukee River Basin Control.
W75-03690 6E

NEW JERSEY
Cappture Realty Corp. v. Board of Adjustment (Suit Challenging Denial of Special Exception Use--Construction in Flood Plains).
W75-03467 6E

NEW MEXICO
Potential Containment Failure Mechanisms and Their Consequences at a Radioactive Waste Repository in Bedded Salt in New Mexico,
W75-03425 5B

Growth of Engelmann Spruce (Picea Engelmannii) Unaffected by Increased Snowpack,
W75-03844 2I

NEW YORK
People v. Oceana Terminal Corp. (Prosecution for an Oil Spill).
W75-03456 6E

Musumeci v. State (Action by Downstream Landowners to Recover Flooding Damages Caused by Relocation of Highway).
W75-03469 6E

Nutrient Uptake Kinetics in Phytoplankton: A Basis for Niche Separation,
W75-03766 5C

Nitrogen and Phosphorus Availability in Lake Ontario Tributary Waters During IFYGL,
W75-03768 5C

NEW ZEALAND
Recent Developments in the New Zealand Rock Oyster Farming Industry (1970-72) and Problems Regarding Aquatic Pollution,
W75-03516 5C

NICHES
Nutrient Uptake Kinetics in Phytoplankton: A Basis for Niche Separation,
W75-03766 5C

NICKEL
The Extraction of Nickel from Various Salt Solutions with Oxine in Chloroform,
W75-03630 2K

NIGERIA (SAMARU)
The Hydrology of a Small Catchment Basin at Samaru, Nigeria: III. Assessment of Surface Run-Off Under Varied Land Management and Vegetation Cover,
W75-03765 4A

NISQUALLY GLACIER
Variations in the Sliding of a Temperate Glacier,
W75-03666 2C

NITRATES
Advisory Report on Health Effects of Nitrates in Water.
W75-03484 5C

Stream Chemistry Following a Forest Fire and Urea Fertilization in North-Central Washington,
W75-03822 2K

Content of Chemical Substances in Farm Crops Grown on Soil Irrigated with Waste Waters of Coke By-Product Plants, (In Russian),
W75-03846 5B

NITRIFICATION
A Basic Study of Biological Nitrification and Denitrification, (In Japanese),
W75-03550 5D

NITRILOTRIACETIC ACID
A Study of Nitrilotriacetic Acid (NTA) Degradation in a Receiving Stream,
W75-03601 5B

NITROGEN
Relationships Between Moisture Availability and Nitrogen Response in Winter Wheat,
W75-03307 3F

Influence of Fertilizer Practices on Water and the Quality of the Environment (Phase II),
W75-03315 5B

High Rate Biological Denitrification Using a Granular Fluidized Bed,
W75-03382 5D

Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

Some Effects of Nitrogen and Phosphorus Limitation on a Biological-Chemical Wastewater Treatment Process,
W75-03543 5D

The Three Sludge System for Nitrogen and Phosphorus Removal,
W75-03556 5D

Nitrogen Budgets of Great Plains Impoundments,
W75-03758 5C

Stream Chemistry Following a Forest Fire and Urea Fertilization in North-Central Washington,
W75-03822 2K

Comparative Study of Nitrogen Sources for Fertilisation of Rainfed Bajra,
W75-03829 3F

NITROGEN COMPOUNDS
Physiological and Ecological Significance of the Chemical Instability of the Uric Acid and Related Purines in Sea Water and Marine Algal Culture Medium,
W75-03512 5C

Nitrogen and Phosphorus Availability in Lake Ontario Tributary Waters During IFYGL,
W75-03768 5C

NITROGEN SOURCES
Nitrogen Budgets of Great Plains Impoundments,
W75-03758 5C

NOBLE GASES
Storage of Tritium and Noble Gases,
W75-03418 5D

NON-STRUCTURAL ALTERNATIVES
Robert E. Nilles, Inc. v. Illinois Pollution Control Bd. (Action Against Pollution Control Board for Denial of Sewerage Permits).
W75-03474 6E

NORTH ATLANTIC REGION
Multilevel Approach for Regional Water Resources Planning and Management, Volume I,
W75-03434 6A

NORTH CAROLINA
Hydrologic Information Storage and Retrieval System,
W75-03316 7C

Report of Proceedings at Public Hearing Concerning the Reclassification of Various Streams in the Cape Fear (Lower Section), Lumber, Neuse and White Oak River Basins.

Subglacial Geomorphology Surrounding the Ice-Free Valleys of Southern Victoria Land, Antarctica,
W75-03667 2C

Remote Sensing of Algal Blooms by Aircraft and Satellite in Lake Erie and Utah Lake,
W75-03760 5A

REPRO-MODELING
The Application of Repro-Modeling to the Analysis of a Photochemical Air Pollution Model,
W75-03633 5B

REPRODUCTION
Effect of Salt Water Ingestion on Pregnancy in the Ewe and on Lamb Survival,
W75-03529 3C

RESEARCH AND DEVELOPMENT
Publications List of the Idaho Water Resources Research Institute.
W75-03321 10C

State University System of Florida Sea Grant Program 1972.
W75-03714 6E

Sea Grant Program 1973, State University System of Florida.
W75-03720 9A

Hydrometallurgy,
W75-03793 3E

RESEARCH FACILITIES
Twenty Years of Work on Solar Distillation at the University of California,
W75-03810 3A

RESERVOIR SILTING
Survey of Erosion and Land Use Within the Catchment Area of Keepit Dam (Australia): Part 1 - Climate, Geology, Soils,
W75-03530 4D

RESERVOIRS
Range of Cumulative Sums, II. Application to Storage Capacity of Reservoirs,
W75-03669 2H

Dams.
W75-03672 6E

Altering Alabama's History,
W75-03688 4A

Dams and Reservoirs.
W75-03694 6E

RESINS
Removal of Resin Acids from Culture Media and Kraft-Mill Effluents by Yeasts and Some Other Fungi,
W75-03599 5D

RESISTANCE
Heavy Metal Tolerance in Algae Isolated from Polluted Lakes Near the Sudbury, Ontario Smelters,
W75-03781 5C

RESOURCE ALLOCATION
Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

RESOURCE USE
1971 Salmon River Estuary Resource Use Study,
W75-03344 6C

1971 Sand Lake Estuary Resource Use Study,
W75-03345 6C

RESPIRATION
Temperature Effects on Growth and Respiration Rates of Dolania Americana (Ephemeroptera),
W75-03510 5C

RETRICULATION
Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Fifth Annual Report, Year Ended 30th June 1973.
W75-03432 5G

REVEGETATION
Firt Year Vegetation After Fire, Reseeding, and Fertilization on the Entiat Experimental Forest,
W75-03823 4D

REVERSE OSMOSIS
Concentration of Polarisation in Reverse Osmosis Flow Systems Under Laminar Conditions. Effect of Surface Roughness and Fouling,
W75-03375 5D

Membranes and Modules for the Water Desalination with Reverse Osmosis (Membranen und Module fur die Wasserentslzung mit Umgekehrter Osmose),
W75-03384 3A

Desalination - New Water for Old (Entsalzung-Frischwasserversorgung und Abwasseraufbereitung),
W75-03385 5D

Storage of Tritium and Noble Gases,
W75-03418 5D

Novel Methods of Freshwater Preparation and Waste Water Purification in Pulp and Paper Mills (Neuere Methoden zur Frischwasseraufbereitung und Abwasserreinigung in Zellstoff- und Papierfakriken),
W75-03602 5D

Method of Preparing Water Purification Membranes,
W75-03756 3A

REVIEWS
Disinfection,
W75-03369 5D

Anaerobic Digestion of Organic Matter,
W75-03371 5D

State of the Art-Activated Carbon Treatment of Wastewater,
W75-03545 5D

Urban Runoff and Combined Sewer Overflow, (Literature Review),
W75-03553 5D

Mixing and Transport, (Literature Review),
W75-03554 5B

The Use of Aerobic Processes for the Stabilization of Animal Wastes,
W75-03555 5D

Mercury in Tunas: A Review,
W75-03622 5C

A Critical Review of Vollenweider's Nutrient Budget Model and Other Related Models,
W75-03761 5C

RHODESIA (LAKE KARIBA)
Observations on a Breeding Pair of Tilapia Rendalli Rendalli Boulenger 1896 in an Experimental Tank at Lake Kariba Fisheries Research Institute,
W75-03501 8I

RIPARIAN LAND
Bonelli Cattle Co. v. Arizona (Quiet Title Action).
W75-03493 6E

RIPARIAN RIGHTS
The Necessity of Zoning Variance or Amendments Notice to the Wisconsin Department of Natural Resources Under the Shoreland Zoning and Navigable Waters Protection Act,
W75-03364 6E

Pierce v. Riley (Action by Lake Owners for Injunctive Relief).
W75-03476 6E

Oliver v. Milliken and Farwell, Inc. (Action Involving Division Among Riparian Owners of Alluvial Deposits).
W75-03481 6E

Effluent Neighbors: The Mexico-United States Water Quality Dilemma.
W75-03677 5G

RIVER BASIN COMMISSIONS
The Influence of Recent Trends in Water Legislation on the Structure and Functions of Water Administration,
W75-03363 6E

The Planning Audit: A Framework with Particular References to River Basin Planning,
W75-03525 6B

RIVER BASIN DEVELOPMENT
The Influence of Recent Trends in Water Legislation on the Structure and Functions of Water Administration,
W75-03363 6E

RIVER BASINS
Twelve Basin Investigation: Analysis of Potential Increases in Precipitation and Streamflow Resulting from Modification of Cold Orographic Clouds in Selected River Basins of the Western United States. Volume 2,
W75-03639 3B

RIVER DANUBE
The Microflora in the Settling and Subsoil Water Enriching Basins of the Budapest Waterworks,
W75-03763 5C

RIVER REGULATION
Report of Proceedings at Public Hearing Concerning the Reclassification of Various Streams in the Cape Fear (Lower Section), Lumber, Neuse and White Oak River Basins.
W75-03717 4A

RIVER YAMUNA (INDIA)
Limnological Studies on the River Yamuna at Delhi, India. Part II. The Dynamics of Potamoplankton Populations in the River Yamuna,
W75-03784 5C

RIVERS
The Delaware Estuary System, Environmental Impacts and Socio-Economic Effects,
W75-03352 6G

Winnipesaukee River Basin Control.
W75-03690 6E

Limnological Studies on the River Yamuna at Delhi, India. Part II. The Dynamics of Potamoplankton Populations in the River Yamuna,
W75-03784 5C

RIVERS AND HARBORS ACT
United States v. Chesapeake and Delaware Shipyard, Inc. (Suit by Government to Recover Under the 'Wreck Act').
W75-03358 6E

United States v. Raven (Appeal from Conviction for Failing to Remove Sunken Vessel and Obstructing Navigable Waterway).
W75-03462 6E

Di Vosta Rentals Inc. v. Lee (Review of Denial of Fill Permit).
W75-03492 6E

U.S. V. Colgate-Palmolive Co. (Action Charging Unlawful Discharge of Refuse Matter Into Navigable Waters),
W75-03702 6E

United States v. Republic Steel Corp. (Refuse Discharge into Navigable Waters).
W75-03727 6E

ROAD CONSTRUCTION
Commonwealth of Kentucky, Department of Highways v. Fitzpatrick (Eminent Domain Action for Taking of River Bottom Lands).
W75-03477 6E

ROCK MECHANICS
Effect of Fluid Content on the Mechanical Properties of Westerly Granite,
W75-03428 5B

ROCK PROPERTIES
Selected Physicochemical Properties of Basaltic Rocks, Liquids, and Glasses,
W75-03419 8H

Effect of Fluid Content on the Mechanical Properties of Westerly Granite,
W75-03428 5B

ROCKFILL DAMS
Monitoring of Earth-Rock Dams,
W75-03533 8D

ROCKS
Determination of Mercury in Fluorspar Mining Survey Samples,
W75-03794 5A

ROCKY MOUNTAIN REGION
Economic Development and Water Resources Investments,
W75-03343 6B

ROMANIA
The Problem of Determining the Maximum Storm Runoff Yield in Small Rivers (In problema determinarii debitelor maxime din ploi pe riuri mici),
W75-03535 2A

ROMANIA (DANUBE RIVER)
Observations on the Nutrition of Larvae of Chironomus f.l. Plumosus in the Waters of the Danube Flood Area, (In Romanian),
W75-03827 2I

ROOT TEMPERATURE
Lucerne in Wet Soils: The Effect of Stage of Regrowth, Cultivar, Air Temperature and Root Temperature,
W75-03847 2I

ROOTED AQUATIC PLANTS
Static Pressure Fractionation Characteristics of Water Hyacinth,
W75-03302 4A

ROUTING
Conservation--Alteration of Streams.
W75-03675 6E

RUBBER
Removal of Trace Metals from Waste Water by Treatment with Lime and Discarded Automotive Tires,
W75-03591 5D

New Rubber Expansion Joints for Pipelines.
W75-03819 8G

RUNNING WATERS
Snail Population in Running Water,
W75-03803 2I

RUNOFF FORECASTING
The Hydrology of a Small Catchment Basin at Samaru, Nigeria: III. Assessment of Surface Run-Off Under Varied Land Management and Vegetation Cover,
W75-03765 4A

SAFETY
Guidelines for the Interim Storage of AEC-Generated Solid Transuranic Wastes.
W75-03430 5D

Dams and Reservoirs.
W75-03694 6E

SAHARA LAKES
Some Predicted Climatic Effects of a Simulated Sahara Lake,
W75-03635 2B

SALINE WATER
Influence of Saline Drinking Water on Mineral Balances in Sheep,
W75-03637 3C

SALINE WATER-FRESHWATER INTERFACES
Saltwater Intrusion into a Flowing Stream,
W75-03634 2L

SALINE WATER SYSTEMS
Thermodynamic Properties of Sea Salt Solutions,
W75-03808 2K

SALINITY
Guidelines for Land Disposal of Feedlot Lagoon Water.
W75-03306 5G

Influence of Salinity on the Eggs and Larvae of the California Killifish Fundulus Parvipinnis,
W75-03334 5C

Salt Tolerance in the Wild Relatives of the Cultivated Tomato: Water Balance and Abscisic Acid in Lycopersicon Esculentum and L. Peruvianum Under Low and High Salinity,
W75-03549 3C

Ultraviolet Absorption/Salinity Correlation as an Index of Pollution in Inshore Sea Waters,
W75-03767 5A

SALMON RIVER ESTUARY (ORE)
1971 Salmon River Estuary Resource Use Study,
W75-03344 6C

SALMONELLA
Epidemiologic Relationships Between Human and Animal Salmonella Carriers and Their Environment in the Swiss Region of the Lake of Constance, (In German),
W75-03330 5C

SALMONIDS
Effect of Nitrogen Supersaturated Water on Coho and Chinook Salmon,
W75-03520 5C

Sewage and Aquacultural Production,
W75-03524 5L

SALT MARSHES
Control of Salt-Marsh Mosquitoes with Abate Insecticide at Coombabah Lakes, Queensland Australia,
W75-03836 5C

SALT MINES
Potential Containment Failure Mechanisms and Their Consequences at a Radioactive Waste Repository in Bedded Salt in New Mexico,
W75-03425 5E

SALT RIVER BASIN (KENT)
Changes in the Economy and Ecology a Proposed Lake Sites in the Salt River Basin Kentucky, During Early Construction of the Dam for Taylorsville Lake,
W75-03309 5C

SALT RIVER SALT BANKS (ARIZ)
Proposed Natural Areas, Salt River Salt Banks Report No 2,
W75-03396 6E

SALT TOLERANCE
Effect of Salt Water Ingestion on Pregnancy in the Ewe and on Lamb Survival,
W75-03529 3C

Salt Tolerance in the Wild Relatives of the Cultivated Tomato: Water Balance and Abscisic Acid in Lycopersicon Esculentum and L. Peruvianum Under Low and High Salinity,
W75-03549 3C

SALTS
The Extraction of Nickel from Various Salt Solutions with Oxine in Chloroform,
W75-03630 2K

SAND LAKE ESTUARY (ORE)
1971 Sand Lake Estuary Resource Use Study,
W75-03345 6C

SANITARY ENGINEERING
In Re Barker Sargent Corp (Appeal from Environmental Board Decision).
W75-03466 6E

Committee For the Consideration of the Jones Falls Sewage System V. Train (Action Seeking Injunctive Relief Restraining the Granting of Sewer Hook-Up Permits),
W75-03710 6E

SCALING
Beneficiation of Lignin Solutions and Pulp Mill Wastes,
W75-03593 5D

SCAVENGING
A One-Dimensional Numerical Model of Precipitation Scavenging With Application to Rainout of Radioactive Debris,
W75-03427 5B

SCREENS
Hydrodynamic Effects on Flow Through Screens at Intakes,
W75-03659 8B

Floating Water Screen,
W75-03745 8I

SEA ICE
Effects of Oil Under Sea Ice,
W75-03646 2C

Differential Sea-Ice Drift. I. Spatial and Temporal Variations in Sea-Ice Deformation,
W75-03649 2C

Differential Sea-Ice Drift. II. Comparison of Mesoscale Strain Measurements to Linear Drift Theory Predictions,
W75-03650 2C

SEA WATER
Diffusion of Ions in Sea Water and in Deep-Sea Sediments,
W75-03611 5B

Hydrogen Evolution on Beta III Titanium Alloy,
W75-03809 2K

SEASONAL
On the Variability of Seasonal Parameters in Hydrologic Time Series,
W75-03658 2E

Range of Cumulative Sums, II. Application to Storage Capacity of Reservoirs,
W75-03669 2H

SEDGELAND WATERS
Chemistry of Some Sedgeland Waters: Lake Pedder, South-West Tasmania,
W75-03390 5B

SEDIMENT TRANSPORT
Sediment in Streams and Its Effects on Aquatic Life,
W75-03303 2J

SEDIMENTATION
Unnatural Shoreline,
W75-03459 5G

SEDIMENTS
Kinetics of Mercury Adsorption and Desorption in Sediments,
W75-03610 5B

Diffusion of Ions in Sea Water and in Deep-Sea Sediments,
W75-03611 5B

Atomic Absorption Spectrophotometric Determination of Microgram Levels of CO, NI, CU, PB, and ZN in Soil and Sediment Extracts Containing Large Amounts of MN and FE,
W75-03618 5A

SEEPAGE
Moss Rose Manufacturing Co. v. Foster (Action for Recovery of Water Damage Caused by Seepage).
W75-03455 6E

SEISMOLOGY
A Geological and Seismological Investigation of the Lawrence Livermore Laboratory Site,
W75-03429 5B

SELECTIVITY
Toxicity of 2-(Digeranylamino)-Ethanol, A Candidate Selective Fish Toxicant,
W75-03509 5C

SELENIUM
Selenium Biochemistry,
W75-03620 5C

SELF PURIFICATION
Investigations About Population Dynamics and Nutritional Aspects on the Simulid-Larvae of a Mountain Stream Polluted by Organic Waste Water, (In German),
W75-03479 5B

SEPARATION TECHNIQUES
Waterless Sanitation for Rest Areas,
W75-03370 5D

Membranes and Modules for the Water Desalination with Reverse Osmosis (Membranen und Module fur die Wasserentslzung mit Umgekehrter Osmose),
W75-03384 3A

Wastewater Degassing by Adiabatic Flashing,
W75-03446 5D

Method and Apparatus for Recovering a Substance Floating as a Sheet on the Surface of a Liquid Mass,
W75-03449 5G

Modified Cellulose Adsorbent for Removal of Mercury From Aqueous Solutions,
W75-03579 5D

Mercury Determination at the Microgram Level by a Reduction-Aeration Method of Concentration,
W75-03617 5A

Separation of Copper (II) from Uranium (VI) and Many Other Elements by Cation-Exchange Chromatography in Acetone-Hydrobromic Acid Media - Improved Selective Separation of Copper,
W75-03628 5A

The Extraction of Nickel from Various Salt Solutions with Oxine in Chloroform,
W75-03630 2K

Method and Apparatus for Processing Waste Water Slimes of Steel Mill Water Treatment Systems,
W75-03740 5D

Treatment of Sewage,
W75-03746 5D

Hydrometallurgy,
W75-03793 3E

SEVERANCE BASIN (COLO)
Ground-Water Quality Study,
W75-03534 5B

SEWAGE
A Program for the Future--Water and Sewer in Rural America.
W75-03488 5D

Committee For the Consideration of the Jones Falls Sewage System V. Train (Action Seeking Injunctive Relief Restraining the Granting of Sewer Hook-Up Permits),
W75-03710 6E

Thermal Drying of Mechanically Dehydrated Urban Sewage Sludge in a Boiling Layer System (Termicheskaya sushka mekhanicheski obezvozhennykh osadkov gorodskikh stochnykh vod v kipyashchem sloye),
W75-03818 5D

SEWAGE DISPOSAL
Waterless Sanitation for Rest Areas,
W75-03370 5D

Powered Mobile Spray Irrigation for Productive Crop Sewage Utilization,
W75-03743 5D

Disposal of Alum Sludge to the Existing Activated Sludge Wastewater Treatment Plant,
W75-03774 5D

Replaces New Works 1900 Installation.
W75-03817 5D

SEWAGE EFFLUENTS
Commonwealth v. Washington Township (Action to Order Compliance with Clean Streams Law).
W75-03468 6E

Committee For the Consideration of the Jones Falls Sewage System V. Train (Action Seeking Injunctive Relief Restraining the Granting of Sewer Hook-Up Permits),
W75-03710 6E

SEWAGE SLUDGE
Cadmium Uptake by Wheat from Sewage Sludge Used as a Plant Nutrient Source: A Comparative Study Using Flameless Atomic Absorption and Neutron Activation Analysis,
W75-03503 5A

Anaerobic Digestion of Primary Sludge Containing Iron Phosphate,
W75-03776 5D

Phosphorus Leaching from Sewage Sludge Used as a Landfill,
W75-03782 5D

SEWAGE TREATMENT
Unique New Secondary Oxygen Treatment System for Effluent.
W75-03372 5D

Combined Chemical-Biological Treatment Studies,
W75-03383 5D

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Second Annual Report Year Ended June 1970.
W75-03433 5G

A Program for the Future--Water and Sewer in Rural America.
W75-03488 5D

The Use of Pollutants for Aquaculture - Conditioning of Wastes for Aquaculture,
W75-03514 5D

Sewage and Aquacultural Production,
W75-03524 5D

A Sludge Cake Incineration Process and Air Pollution Control System,
W75-03546 5D

Phosphorus Removal Practice.
W75-03558 5D

Sewage Treatment in the City of Plymouth,
W75-03561 5D

Sewage Treatment System,
W75-03563 5D

Treatment of Sewage,
W75-03746 5D

Water Pollution Research in Canada 1973,
W75-03770 5D

The Effects of Aluminum Sludge from Water Purification on Municipal Primary Sewage Treatment,
W75-03778 5D

Wet Air Oxidation of Low Molecular Weight Organic Acids,
W75-03783 5D

SEWERAGE
Waterless Sanitation for Rest Areas,
W75-03370 5D

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Fifth Annual Report, Year Ended 30th June 1973.
W75-03432 5G

The Sewage System of the City of Rangoon,
W75-03544 5D

SEWERS
The Sewage System of the City of Rangoon,
W75-03544 5D

PVC Sewer Pipe Meets Tight Specifications.
W75-03547 8A

Sewer Pipe: Infiltration is the Issue,
W75-03548 5D

SHEEP
Effect of Salt Water Ingestion on Pregnancy in the Ewe and on Lamb Survival,
W75-03529 3C

Influence of Saline Drinking Water on Mineral Balances in Sheep,
W75-03637 3C

SHELLFISH
Recent Developments in the New Zealand Rock Oyster Farming Industry (1970-72) and Problems Regarding Aquatic Pollution,
W75-03516 5C

SHELLFISH FARMING
Commercial Oyster Fishery Development Investigation,
W75-03350 6C

SHELTERBELTS
The Effect of Shelter Belts and Irrigation on Water Use in a Dry Region,
W75-03652 3F

SHORE PROTECTION
Anti-Heave Protective System,
W75-03732 8B

Mechanical Reef,
W75-03738 2J

Anti-Erosion Device,
W75-03742 2J

Beach-Protectors,
W75-03748 2J

Reinforced Mattress for Protecting Shorelines and the Like,
W75-03749 2J

SHORELINE
Unnatural Shoreline,
W75-03459 5G

SHORELINES
Coastal Zone Management in Maine: A Legal Perspective,
W75-03689 6E

SHRIMPS
Mercury Content of Fish and Shrimps Caught Off the Belgian Coast,
W75-03518 5C

SILVER
Removal of Trace Metals from Waste Water by Treatment with Lime and Discarded Automotive Tires,
W75-03591 5D

Gravimetric Estimation of Silver as Diamminesilver (I) Tetraisothiocyanatodianilinechromate (III),
W75-03790 5A

SIMULATION ANALYSIS
Water Quality Models for Urban and Suburban Areas.
W75-03311 5B

Hydrologic Simulation of a Complex Watershed,
W75-03325 2A

SIMULIID LARVAE
Investigations About Population Dynamics and Nutritional Aspects on the Simulid-Larvae of a Mountain Stream Polluted by Organic Waste Water, (In German),
W75-03479 5B

SITES
Description of Experimental Plot Design of Site 1 and the Control Area,
W75-03403 5C

A Geological and Seismological Investigation of the Lawrence Livermore Laboratory Site,
W75-03429 5B

SKILLET FISH
Dissolved Oxygen Requirements of Newly-Hatched Larvae of the Striped Blenny (Chasmodes Bosuianus), the Naked Goby (Gobiosoma Bosci), and the Skilletfish (Gobiesox Strumosus),
W75-03519 5C

SKIMMERS
Rotary Skimmer,
W75-03736 5G

SKIMMING
Pollution Suction Water Sweeper,
W75-03733 5G

Rotary Skimmer,
W75-03736 5G

SLIME
Slime Control Compositions and Their Use,
W75-03575 5D

Metal Salts of Dithiocarbamic Acid Derivatives, Their Manufacture and Use (Metallsalze von Dithiocarbamidsaeure-derivaten, deren Herstellung und Versendung),
W75-03581 5D

Slime Control in Industrial Waters,
W75-03594 5D

Method and Apparatus for Processing Waste Water Slimes of Steel Mill Water Treatment Systems,
W75-03740 5D

SLUDGE
Lime Sludge: Some Problems--Some Solutions,
W75-03378 5D

Talking Tankers.
W75-03560 5E

Measurements of Sludge Level and Sludge Density in Clarifier Installations (Messungen von Schlamminiveau und Schlammdichte in Klaeranlagen),
W75-03586 5D

Thermal Drying of Mechanically Dehydrated Urban Sewage Sludge in a Boiling Layer System (Termicheskaya sushka mekhanicheski obezvozhennykh osadkov gorodskikh stochnykh vod v kipyashchem sloye),
W75-03818 5D

SLUDGE DIGESTION
A Performance Study of Aerobic Sludge Digestion,
W75-03773 5D

SLUDGE DISPOSAL
Treatment of Waste-Water Containing Surface Active Substances, (In Japanese),
W75-03376 5D

Water Treatment Plant Wastes Disposal-Part 2,
W75-03444 5D

Talking Tankers.
W75-03560 5E

Some Aspects of Treatment and Disposal of Biological and Nonbiological Sludges of the Paper and Board Industry (Einige Aspekte der Behandlung und Beseitigung von biologischen und nichtbiologischen Schlaemmen der Papier- und Kartonindustrie),
W75-03580 5D

Problem-Free Clarifier Sludge Treatment by a New Thermal Two-Stage Process (Problemlose Klaerschlammbehandlung durch ein neues thermisches Zweistufen-Verfahren),
W75-03609 5D

The Effects of Aluminum Sludge from Water Purification on Municipal Primary Sewage Treatment,
W75-03778 5D

SLUDGE TREATMENT
Bacterial Production of Enzymes in Activated Sludge Systems,
W75-03380 5D

Water Treatment Plant Wastes Disposal-Part 2,
W75-03444 5D

Alum Recovery from Water and Wastewater Treatment Plant Sludges,
W75-03542 5D

The Three Sludge System for Nitrogen and Phosphorus Removal,
W75-03556 5D

Removal of Arsenic From Effluent Sludges of Sulfate and of Pulp and Paper Production (Udalenie mysh'yaka iz shlamov sernokislotnogo i tsellyulozno-bumazhnogo proizvodstva),
W75-03568 5D

Some Aspects of Treatment and Disposal of Biological and Nonbiological Sludges of the Paper and Board Industry (Einige Aspekte der Behandlung und Beseitigung von biologischen und nichtbiologischen Schlaemmen der Papier- und Kartonindustrie),
W75-03580 5D

Problem-Free Clarifier Sludge Treatment by a New Thermal Two-Stage Process (Problemlose Klaerschlammbehandlung durch ein neues thermisches Zweistufen-Verfahren),
W75-03609 5D

Process of and Installation for Purifying Sewage,
W75-03752 5D

Wet Air Oxidation of Low Molecular Weight Organic Acids,
W75-03783 5D

Replaces New Works 1900 Installation.
W75-03817 5D

SMALL ANIMALS (MAMMALS)
Small-Mammal Populations in Site 1 and the Control Area,
W75-03414 5C

SMALL GAME
Small-Mammal Populations in Site 1 and the Control Area,
W75-03414 5C

SMALL WATERSHEDS
Evolution of the Small Watershed Program, Changes in Public Law 566--Watershed Protection and Flood Prevention Program, 1954-72,
W75-03483 4D

SNAILS
Snail Population in Running Water,
W75-03803 2I

SNOW SURVEYS
Using Aerial Measurements of Forest Overstory and Topography to Estimate Peak Snowpack,
W75-03570 2C

SNOWMELT
Growth of Engelmann Spruce (Picea Engelmannii) Unaffected by Increased Snowpack,
W75-03844 2I

SNOWPACKS
Using Aerial Measurements of Forest Overstory and Topography to Estimate Peak Snowpack,
W75-03570 2C

Growth of Engelmann Spruce (Picea Engelmannii) Unaffected by Increased Snowpack,
W75-03844 2I

SOCIAL ADJUSTMENT
Displacement of Persons by Major Public Works, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures---Phase 5,
W75-03308 6B

SOCIAL CHANGE
Displacement of Persons by Major Public Works, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures---Phase 5,
W75-03308 6B

SOCIAL COSTS
Reconciling Conflicts Among Different Economic Interest Groups in the Management of Fisheries,
W75-03392 6B

SOCIAL IMPACT
Displacement of Persons by Major Public Works, Anthropological Analysis of Social and Cultural Benefits and Costs from Stream Control Measures---Phase 5,
W75-03308 6B

SOCIAL PARTICIPATION
Factors Influencing Participation in Recreation Activities in Southeast Iowa, and Camper Attendance at Macbride State Park,
W75-03317 6B

The Planning Audit: A Framework with Particular References to River Basin Planning,
W75-03525 6B

SOCIAL WELL-BEING
An Analysis of Social Well-Being Change Associated with Resource Development Projects in Wyoming,
W75-03319 6B

SOIL CONTAMINATION
Experimental Support Studies for the Percol and Transport Models,
W75-03422 5B

Characterization of Actinide Bearing Soils: Top Sixty Centimeters of 216-Z-9 Enclosed Trench,
W75-03423 5B

SOIL CONTAMINATION EFFECTS
Heavy Metal Tolerance in Typha Latifolia Without the Evolution of Tolerant Races,
W75-03513 5C

SOIL DISPOSAL FIELDS
Mill Effluent and its Utilisation for Crop Cultivation Purposes,
W75-03585 5D

Aerobic Wastewater Treatment System with Partial Reuse and Infrequent Dosing to Soil,
W75-03741 5D

SOIL EROSION
A simple Device for Analyzing the Energy Load and Intensity of Rainstorms,
W75-03838 2B

SOIL LOSSES
Prediction of Subtropical Storm Soil Losses from Field Plot Studies,
W75-03806 2G

SOIL MOISTURE
Relationships Between Moisture Availability and Nitrogen Response in Winter Wheat,
W75-03307 3F

Moisture Profiles in Swelling Soils,
W75-03527 2G

Productivity in Dwarf Wheats in a Silt-Loam Soil as Influenced by Soil-Moisture Regimes and Nitrogen Fertilization Under Shallow Water Table Conditions,
W75-03557 3F

The Effect of Shelter Belts and Irrigation on Water Use in a Dry Region,
W75-03652 3F

Soil Moisture-Vegetation-Temperature Relationships in Central Alaska,
W75-03657 2G

Axisymmetric Infiltration in Soils, II. Summary of Infiltration Characteristics Related to Problem Specifications,
W75-03670 2G

Effects of Experimental Soil Moisture Fluctuations on Turnover Rates of Testacea,
W75-03681 2G

SOIL PROFILES
Moisture Profiles in Swelling Soils,
W75-03527 2G

SOIL TEMPERATURE
Soil Moisture-Vegetation-Temperature Relationships in Central Alaska,
W75-03657 2G

Autumn, Winter and Spring Soil Temperatures in Okstindan, Norway,
W75-03665 2C

SOIL TEMPERATURE PLASTICS
Effect of Organic Mulches on the Hydrothermal Regime of Soil and Growth of Potato Crop in Northern India,
W75-03837 3F

SOIL WATER
Utility of a Simple Soil Water Budget Model in Agronomic Research: I. Effects of Plant Density, Time-of-Sowing and Fallow Water on Available Soil Water Under Spring Wheat,
W75-03450 3F

Estimating Soil Water Content on Native Rangeland,
W75-03800 2G

SOIL WATER MOVEMENT
Moisture Profiles in Swelling Soils,
W75-03527 2G

Axisymmetric Infiltration in Soils, II. Summary of Infiltration Characteristics Related to Problem Specifications,
W75-03670 2G

SOIL-WATER-PLANT RELATIONSHIPS
Ecology and the Problem of Rehabilitating Wastes from Mineral Extraction,
W75-03626 5G

Actual Evapotranspiration in Relation to Leaf Area,
W75-03653 2D

Snow-Vegetation Relationships in the Forest Tundra of Nouveau-Quebec, Hudson Bay, (In French),
W75-03849 2I

SOILS
Atomic Absorption Spectrophotometric Determination of Microgram Levels of CO, NI, CU, PB, and ZN in Soil and Sediment Extracts Containing Large Amounts of MN and FE,
W75-03618 5A

SOLAR DISTILLATION
Twenty Years of Work on Solar Distillation at the University of California,
W75-03810 3A

Twenty Years of Work on Solar Distillation at the University of California,
W75-03810 3A

SOLAR RADIATION
Solar Radiation Measurements in the Enterprise Radiation Forest,
W75-03404 5C

Measurement of Atmospheric Precipitable Water Using a Solar Radiometer,
W75-03638 2B

SOLAR RADIOMETER
Measurement of Atmospheric Precipitable Water Using a Solar Radiometer,
W75-03638 2B

SOLEA-SOLEA
Accumulation, Distribution, Transformation and Elimination of DDT-14C in Solea Solea (Pisces: Soleidae), (In German),
W75-03494 5C

SOLUBILITY
The Dissolution of Pu-238 in Environmental and Biological Systems,
W75-03431 5B

SOLVENTS
The Opening Up of Insoluble Oxides (Tantalum, Niobium, Chromium, Aluminium, and Others), With Liquid Selenium Dioxide,
W75-03614 5A

SORGHUM HYBRIDS
Physiological Analysis of the Response of Sorghum Hybrids 'CSH-1' and 'CSH-2' to Rain-Fed Cultivation,
W75-03368 3F

SOUTH CAROLINA
Expansion and Evaluation of an Artificial Reef Off Murrell's Inlet, South Carolina,
W75-03348 6C

State Ex Rel. McLeod V. Murrell's Inlet Camp and Marina, Inc. (Quiet Title Action Involving Riparian Land),
W75-03704 6E

SOUTH DAKOTA
Jewett v. Redwater Irrigating Association (Action for Adjudication of Water Rights).
W75-03471 6E

SOUTHBRIDGE (MASS)
East Brimfield and Westville Reservoirs. Quantity and Value of Water Supply Storage. Quinebaug River--Massachusetts.
W75-03437 6D

SOVEREIGN IMMUNITY
State of Minnesota V. Environmental Protection Agency (Action of Impoundment of FWPCA Funds),
W75-03705 6E

SPECIATION
Description and Classification of Plant Communities in Site 1 and the Control Area,
W75-03407 5C

SPECIFIC PRODUCTION
Specific Production of Aquatic Invertebrates,
W75-03327 5C

SPECTROPHOTOMETRY
Photometric Titration of Beryllium(II) with 5-Sulfosalicylic Acid,
W75-03629 2K

SPECTROSCOPY
The Determination of Arsenic by Non-Dispersive Atomic Fluorescence Spectrometry with a Gas Sampling Technique,
W75-03612 5A

Determination of Lead in Atmospheric Particulates by Furnace Atomic Absorption,
W75-03624 5A

Determination of Mercury in Fluorspar Mining Survey Samples,
W75-03794 5A

SPHAGNUM
The Sphagnum Flora of Hot Springs in Iceland,
W75-03526 2I

SPRINKLER IRRIGATION
Powered Mobile Spray Irrigation for Productive Crop Sewage Utilization,
W75-03743 5D

ST. JOHNS RIVER BASIN (FLA)
Energy Evaluation of Water Management Alternatives in the Upper St. Johns River Basin of Florida,
W75-03436 6A

ST. LAWRENCE RIVER
Great Lakes-St. Lawrence Seaway System and the Mid-Continent Economy,
W75-03394 6B

STABLE ISOTOPES
The Dissolution of Pu-238 in Environmental and Biological Systems,
W75-03431 5B

STATE GOVERNMENTS
Department of Pollution Control and Ecology.
W75-03700 6E

State Ex Rel. McLeod V. Murrell's Inlet Camp and Marina, Inc. (Quiet Title Action Involving Riparian Land),
W75-03704 6E

Water Quality Mangement Plans--Proposed Rules.
W75-03718 6E

Pollution Control Awards Program.
W75-03731 6E

STATE POLICY
Regulation of Great Lakes Water Levels--Appendix G--Regulatory Works--Report to the International Joint Commission.
W75-03682 4A

Rivers, Streams and Brooks--Alteration.
W75-03698 6E

STATISTICAL METHODS
Measurement of Atmospheric Precipitable Water Using a Solar Radiometer,
W75-03638 2B

On the Variability of Seasonal Parameters in Hydrologic Time Series,
W75-03658 2E

Multivariate Statistical Analysis of Glacier Annual Balances,
W75-03664 2C

STATISTICAL MODELS
Multivariate Statistical Analysis of Glacier Annual Balances,
W75-03664 2C

STEM DIAMETER
Changes in Stem Diameter of Herbaceous and Woody Plants as a Measure of Internal Water Balance,
W75-03840 2I

STOCK WATER
Effect of Salt Water Ingestion on Pregnancy in the Ewe and on Lamb Survival,
W75-03529 3C

STOMATAL OPENINGS
Light and Water Supply as Factors Influencing the Degree of Stomatal Opening in Conifers, (In German),
W75-03338 2I

STORAGE CAPACITY
Range of Cumulative Sums, II. Application to Storage Capacity of Reservoirs,
W75-03669 2H

STORAGE TANKS
Protected Offshore Storage Facility,
W75-03744 5G

STORM RUNOFF
Water Quality Models for Urban and Suburban Areas.
W75-03311 5B

Pesticide Analysis from Urban Storm Runoff,
W75-03312 5A

The Problem of Determining the Maximum Storm Runoff Yield in Small Rivers (In problema determinarii debitelor maxime din ploi pe riuri mici),
W75-03535 2A

Urban Runoff and Combined Sewer Overflow, (Literature Review),
W75-03553 5D

STORM WATER
The Problem of Determining the Maximum Storm Runoff Yield in Small Rivers (In problema determinarii debitelor maxime din ploi pe riuri mici),
W75-03535 2A

Urban Runoff and Combined Sewer Overflow, (Literature Review),
W75-03553 5D

STORMWATER DRAINAGE
Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Fifth Annual Report, Year Ended 30th June 1973.
W75-03432 5G

STRAIN
Differential Sea-Ice Drift. II. Comparison of Mesoscale Strain Measurements to Linear Drift Theory Predictions,
W75-03650 2C

STREAMFLOW
Twelve Basin Investigation: Analysis of Potential Increases in Precipitation and Streamflow Resulting from Modification of Cold Orographic Clouds in Selected River Basins of the Western United States. Volume 2,
W75-03639 3B

Conservation--Alteration of Streams.
W75-03675 6E

STREAMS
Musumeci v. State (Action by Downstream Landowners to Recover Flooding Damages Caused by Relocation of Highway).
W75-03469 6E

Calculation of Temperature Variations of Small Mountain Streams,
W75-03655 2E

Rivers, Streams and Brooks--Alteration.
W75-03698 6E

STRIPED BLENNIE
Dissolved Oxygen Requirements of Newly-Hatched Larvae of the Striped Blenny (Chasmodes Bosuianus), the Naked Goby (Gobiosoma Bosci), and the Skilletfish (Gobiesox Strumosus),
W75-03519 5C

STRUCTURAL DESIGN
Hawaii's Floating City Development Program. Structural Sizing of Flotation Modules and Construction Barge,
W75-03442 8A

Hawaii's Floating City Development Program. Construction Site Selection,
W75-03443 8A

STRUCTURAL ENGINEERING
Hawaii's Floating City Development Program. Construction Site Selection,
W75-03443 8A

STRUCTURAL MODELS
Hawaii's Floating City Development Program. Structural Sizing of Flotation Modules and Construction Barge,
W75-03442 8A

STRUCTURES
Conservation--Alteration of Streams.
W75-03675 6E

SUBLETHAL EFFECTS
Temperature Effects on Growth and Respiration Rates of Dolania Americana (Ephemeroptera),
W75-03510 5C

Tidal Aquarium for Laboratory Studies of Environmental Effects on Marine Organisms,
W75-03521 5C

Behavioral Alterations in a Simple Predator-Prey System Due to Sublethal Exposure to Mercury,
W75-03788 5C

SUBLETHAL LIMIT
Physiological Effects of a Sublethal Concentration of Phenol in the Pike (Esox Lucius L.) in Pure Brackish Water,
W75-03507 5C

SUBMERGED LANDS
People Ex Rel Gazlay v. Murray (Action to Enjoin Filling Parcel of Submerged Land).
W75-03460 6E

SUBSURFACE INVESTIGATIONS
Collection and Analysis of Pump Test Data for Transmissivity Values,
W75-03421 5B

SUCTION TENSIONS
The Nature of Water Potential Gradients in Trees, (In German),
W75-03336 2I

SUCTION WATER SWEEPER
Pollution Suction Water Sweeper,
W75-03733 5G

SULFATES
Automatic Dosage of Sulfates by an Improved Nephelometric Method (Dosage Automatique des Sulfates par une Methode Nephelometrique Amelioree),
W75-03536 5A

Removal of Arsenic From Effluent Sludges of Sulfate and of Pulp and Paper Production (Udalenie mysh'yaka iz shlamov sernokislotnogo i tsellyulozno-bumazhnogo proizvodstva),
W75-03568 5D

An Automated Method for Determination of Chloride and Sulfate in Freshwater Using Cation Exchange and Measurement of Electrical Conductance,
W75-03576 5A

Content of Chemical Substances in Farm Crops Grown on Soil Irrigated with Waste Waters of Coke By-Product Plants, (In Russian),
W75-03846 5B

SULFITE LIQUORS
Pulping Process Prevents Pollution,
W75-03588 5D

SULFUR
Radiorespirometry: Rapid Toxicological Screening of Environmental Pollutants,
W75-03619 5A

SUNFISHES
Chronic Cadmium Toxicity to the Bluegill (Lepomis Macrochirus Rafinesque),
W75-03511 5C

SURCHARGES (POLLUTION CONTROL)
Determining an Equitable Surcharge for Industrial Wastes,
W75-03397 5G

SURFACE ACTIVE SUBSTANCES
Treatment of Waste-Water Containing Surface Active Substances, (In Japanese),
W75-03376 5D

SURFACE DRAINAGE
Miller Land Co., Inc. v. Liberty Township (Action for Injunction to Remove Drain Tile and Restore Condition of Land).
W75-03713 6E

SURFACE RUNOFF
The Hydrology of a Small Catchment Basin at Samaru, Nigeria: III. Assessment of Surface Run-Off Under Varied Land Management and Vegetation Cover,
W75-03765 4A

SURVEYS
Factors Influencing Participation in Recreation Activities in Southeast Iowa, and Camper Attendance at Macbride State Park,
W75-03317 6B

Physical Condition and Dimensions of Trees in Site 1 and the Control Area,
W75-03408 5C

Vertebrates of the Enterprise Forest: A General Survey,
W75-03413 5C

Survey of Erosion and Land Use Within the Catchment Area of Keepit Dam (Australia): Part 1 - Climate, Geology, Soils,
W75-03530 4D

Guidelines for Development of Criteria for Control of Ocean Waste Disposal.
W75-03632 5E

Autumn, Winter and Spring Soil Temperatures in Okstindan, Norway,
W75-03665 2C

SUSPENDED SOLIDS
Changes in the Economy and Ecology at Proposed Lake Sites in the Salt River Basin, Kentucky, During Early Construction of the Dam for Taylorsville Lake,
W75-03309 5C

Process for Waste Water Purification (Verfahren zum Reinigen von Abwasser),
W75-03582 5D

SWARDS
Defoliation, Leaf Area Index, and the Water Use of Four Temperate Pasture Species Under Irrigated and Dryland Conditions,
W75-03848 3F

SWEDEN
Rainfall Interception in a Forest in the Velen Hydrological Representative Basin,
W75-03654 2I

SWELLING SOILS
Moisture Profiles in Swelling Soils,
W75-03527 2G

SWITZERLAND
Some Aspects of Treatment and Disposal of Biological and Nonbiological Sludges of the Paper and Board Industry (Einige Aspekte der Behandlung und Beseitigung von biologischen und nichtbiologischen Schlaemmen der Papier- und Kartonindustrie),
W75-03580 5D

SWITZERLAND (LAKE OF CONSTANCE)
Epidemiologic Relationships Between Human and Animal Salmonella Carriers and Their Environment in the Swiss Region of the Lake of Constance, (In German),
W75-03330 5C

SYDNEY (AUST)
Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Fifth Annual Report, Year Ended 30th June 1973.
W75-03432 5G

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Second Annual Report Year Ended June 1970.
W75-03433 5G

SYNERGISTIC EFFECTS
Comparative Studies of the Toxicity of Heavy Metals to Phytoplankton and Their Synergistic Interactions,
W75-03775 5C

SYNTHETIC CHEMICALS
Nonbiodegradable and Other Recalcitrant Molecules,
W75-03497 5B

SYNTHETIC HYDROLOGY
On the Variability of Seasonal Parameters in Hydrologic Time Series,
W75-03658 2E

SYSTEMATICS
The Microflora in the Settling and Subsoil Water Enriching Basins of the Budapest Waterworks,
W75-03763 5C

SYSTEMS ANALYSIS
The Planning Audit: A Framework with Particular References to River Basin Planning,
W75-03525 6B

On the Optimal Identification of Parameters in a Parabolic System,
W75-03805 2F

TACNA MARSH (ARIZ)
Tacna Marsh. Natural Area Report No. 35,
W75-03400 6B

TAIWAN
Heavy Metal Contents in Taiwan's Cultured Fish,
W75-03850 5A

TALL OIL
Air and Water Pollution Control in Crude Tall Oil Manufacture in the Pulp and Paper Industry,
W75-03598 5D

TASMANIA (LAKE PEDDER)
Chemistry of Some Sedgeland Waters: Lake Pedder, South-West Tasmania,
W75-03390 5B

TAX RATES
Taxation--Exemption--Property Used for Pollution Control or Water Impoundment.
W75-03724 6E

TAXES
On Taxation as a Pollution Control Policy,
W75-03329 5G

Taxation--Exemption--Property Used for Pollution Control or Water Impoundment.
W75-03724 6E

TECHNOLOGY
Oil on the Sea.
W75-03762 5C

TEMPERATURE
Temperature Effect on Brain Glycogen of Fish,
W75-03447 5C

Toxicity of 2-(Digeranylamino)-Ethanol, A Candidate Selective Fish Toxicant,
W75-03509 5C

Calculation of Temperature Variations of Small Mountain Streams,
W75-03655 2E

Primary Production in Relation to Temperature Structure, Biomass Concentration, and Light Conditions at an Inshore and Offshore Station in Lake Ontario,
W75-03764 5C

TEMPERATURE DIFFERENTIALS
New Multi-Probe Temperature-Profile Measurement System--The 'Thermistor Comb',
W75-03811 3A

TEMPERATURE DISTRIBUTION
New Multi-Probe Temperature-Profile Measurement System--The 'Thermistor Comb',
W75-03811 3A

TEMPORAL DISTRIBUTION
Temporal and Spatial Patterns of Pretreatment Litter Production in Site 1 and the Control Area,
W75-03411 5C

On the Lead Content of Human Hair (1871-1971),
W75-03789 5A

TENNESSEE
Environmental Defense Fund v. Tennessee Valley Authority (Action to Enjoin TVA From Completing Construction of Tellico Dam).
W75-03362 6E

TENNESSEE VALLEY AUTHORITY
Environmental Defense Fund v. Tennessee Valley Authority (Action to Enjoin TVA From Completing Construction of Tellico Dam).
W75-03362 6E

TERRITORIAL SEAS (JURISDICTION)
Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

TERRITORIAL WATERS
Fishery Proposals in the United Nations Seabed Committee: An Evaluation,
W75-03454 6E

Legal and Ecological Aspects of the International Energy Situation,
W75-03490 6G

TERTIARY TREATMENT
Houston Suburbs Profits from Building the State's Wastewater Treatment Plant.
W75-03340 5D

Sewage and Aquacultural Production,
W75-03524 5D

State of the Art-Activated Carbon Treatment of Wastewater,
W75-03545 5D

Phosphorus Removal Practice.
W75-03558 5D

TESLA FAULT (CALIF)
A Geological and Seismological Investigation of the Lawrence Livermore Laboratory Site,
W75-03429 5B

TESTACEA
Effects of Experimental Soil Moisture Fluctuations on Turnover Rates of Testacea,
W75-03681 2G

TESTING PROCEDURES
On the Lead Content of Human Hair (1871-1971),
W75-03789 5A

TEXAS
Houston Suburbs Profits from Building the State's Wastewater Treatment Plant.
W75-03340 5D

Bacteriology of Chlorinated and Unchlorinated Wastewater Effluents,
W75-03366 5D

McCall v. Presley (Seeking Mandamus for Issuance of Building Permit).
W75-03457 6E

Jackson v. Texas Water Rights Commission (Suit Seeking Cancellation of Comm'n. Orders Designating Underground Water Conservation District).
W75-03463 6E

Costs - Exercising Equitable Powers to Award Attorney's Fees to Losing Party Seeking Compliance with the National Environmental Policy Act. Sierra Club v. Lynn, 364 F. Supp. 834 (W.D. Tex. 1973),
W75-03825 6E

TEXTILES
Peat: New Medium for Treating Dye House Effluent,
W75-03577 5D

THEORETICAL ANALYSIS
Differential Sea-Ice Drift. II. Comparison of Mesoscale Strain Measurements to Linear Drift Theory Predictions,
W75-03650 2C

THERMAL CAPACITY
Thermodynamic Properties of Sea Salt Solutions,
W75-03808 2K

THERMAL STRESS
Temperature Effect on Brain Glycogen of Fish,
W75-03447 5C

THERMAL TREATMENT
Problem-Free Clarifier Sludge Treatment by a New Thermal Two-Stage Process (Problemlose Klaerschlammbehandlung durch ein neues thermisches Zweistufen-Verfahren),
W75-03609 5D

THERMISTORS
New Multi-Probe Temperature-Profile Measurement System--The 'Thermistor Comb',
W75-03811 3A

THERMODYNAMIC
Thermodynamic Properties of Sea Salt Solutions,
W75-03808 2K

THERMODYNAMIC BEHAVIOR
Selected Physicochemical Properties of Basaltic Rocks, Liquids, and Glasses,
W75-03419 8H

THERMOMECHANICAL PULP REFINING
Hybrid Donnacona TMR Plant Features Zero Pollution,
W75-03603 5D

THINNING (TREES)
Effects of Thinning on Needle Water Potential in Red Pine,
W75-03499 2I

THIOCARBAMATE PESTICIDES
Determination of N,N-Dialkyl Dithiocarbamates in Waste Water by Thin-Layer Densitometry,
W75-03537 5A

Metal Salts of Dithiocarbamic Acid Derivatives, Their Manufacture and Use (Metallsalze von Dithiocarbamidsaeure-derivaten, deren Herstellung und Versendung),
W75-03581 5D

THIODAN
Preliminary Experiments on the Effect of Thiodan and Endrin on Fish Culture in Indonesia,
W75-03515 5C

THREE SLUDGE SYSTEM
The Three Sludge System for Nitrogen and Phosphorus Removal,
W75-03556 5D

THREE-SPINED STICKLEBACK
Observations on the Ecology of Lacrustrine Populations of the Threespine Stickleback (Gasterosteus Aculeatus L., 1758) in the Matamek River System, Quebec,
W75-03625 5C

TILAPIA-RENDALLI-RENDALLI
Observations on a Breeding Pair of Tilapia Rendalli Rendalli Boulenger 1896 in an Experimental Tank at Lake Kariba Fisheries Research Institute,
W75-03501 8I

TIME SERIES ANALYSIS
On the Variability of Seasonal Parameters in Hydrologic Time Series,
W75-03658 2E

TITANIUM
Hydrogen Evolution on Beta III Titanium Alloy,
W75-03809 2K

TL50
Dissolved Oxygen Requirements of Newly-Hatched Larvae of the Striped Blenny (Chasmodes Bosuianus), the Naked Goby (Gobiosoma Bosci), and the Skilletfish (Gobiesox Strumosus),
W75-03519 5C

TNT
The Toxicity of TNT and Related Wastes to an Aquatic Flowering Plant, Lemna Perpusilla,
W75-03523 5C

TOMATOS
Salt Tolerance in the Wild Relatives of the Cultivated Tomato: Water Balance and Abscisic Acid in Lycopersicon Esculentum and L. Peruvianum Under Low and High Salinity,
W75-03549 3C

TOXICANTS
Toxicity of 2-(Digeranylamino)-Ethanol, A Candidate Selective Fish Toxicant,
W75-03509 5C

TOXICITY
Subacute Toxicity of Methylmercury in the Adult Cat,
W75-03448 5C

Data on Substantiation of the Maximum Allowable Concentration of Butyphos in Waters, (In Russian),
W75-03505 5C

Toxicity of 2-(Digeranylamino)-Ethanol, A Candidate Selective Fish Toxicant,
W75-03509 5C

Chronic Cadmium Toxicity to the Bluegill (Lepomis Macrochirus Rafinesque),
W75-03511 5C

Preliminary Experiments on the Effect of Thiodan and Endrin on Fish Culture in Indonesia,
W75-03515 5C

The Toxicity of TNT and Related Wastes to an Aquatic Flowering Plant, Lemna Perpusilla,
W75-03523 5C

Radiorespirometry: Rapid Toxicological Screening of Environmental Pollutants,
W75-03619 5A

Chronic Fluoride Intoxication from Drinking Water: Preliminary Report,
W75-03695 5C

Comparative Studies of the Toxicity of Heavy Metals to Phytoplankton and Their Synergistic Interactions,
W75-03775 5C

Mercury,
W75-03797 6C

Evaluation of Tolerance Limits of Some Toxic Substances in Industrial Waste Waters by the Ichthyo Toxicity Test, (In Italian),
W75-03821 5A

Effect of Biotic and Abiotic Factors on the Toxicity of Entobacterin for Larvae of Blood-Sucking Mosquitoes and Biting Midges, (In Russian),
W75-03845 5C

TRACE ELEMENTS
Removal of Trace Metals from Waste Water by Treatment with Lime and Discarded Automotive Tires,
W75-03591 5D

Rare Earth Elements in Ferromanganese Nodules and Other Marine Phases,
W75-03615 5B

On the Spring Maximum of the Concentration of Trace Constituents in Atmospheric Precipitation,
W75-03621 5B

Separation of Copper (II) from Uranium (VI) and Many Other Elements by Cation-Exchange Chromatography in Acetone-Hydrobromic Acid Media - Improved Selective Separation of Copper,
W75-03628 5A

TRAINING
Chemical Analyses for Water Quality - Training Manual.
W75-03785 5A

TRAINING MANUALS
Chemical Analyses for Water Quality - Training Manual.
W75-03785 5A

TRANSITION FLOW
Concentration of Polarisation in Reverse Osmosis Flow Systems Under Laminar Conditions. Effect of Surface Roughness and Fouling,
W75-03375 5D

TRANSMISSIBILITY
Collection and Analysis of Pump Test Data for Transmissivity Values,
W75-03421 5B

TRANSPIRATION
In Situ Measurements of Leaf Water Potential and Resistance to Water Flow in Corn, Soybean, and Sunflower at Several Transpiration Rates,
W75-03668 3F

TRANSPORT
Experimental Support Studies for the Percol and Transport Models,
W75-03422 5B

Mixing and Transport, (Literature Review),
W75-03554 5B

TRANSPORTATION
Great Lakes-St. Lawrence Seaway System and the Mid-Continent Economy,
W75-03394 6B

TRANSURANIC WASTES
Guidelines for the Interim Storage of AEC-Generated Solid Transuranic Wastes.
W75-03430 5D

TRANSURANICS
Transuranic Solid Waste Management Research Programs - Quarterly Report, January-March 1974.
W75-03420 5A

TREATMENT FACILITIES
How Do You Explain the Cost,
W75-03333 6C

Houston Suburbs Profits from Building the State's Wastewater Treatment Plant.
W75-03340 5D

Treatment Facility Incorporates Unique Design Features,
W75-03379 5D

Evaluation of the Georgia Water Supply Program.
W75-03435 5F

A Sludge Cake Incineration Process and Air Pollution Control System,
W75-03546 5D

Sewage Treatment in the City of Plymouth,
W75-03561 5D

Sewage Treatment System,
W75-03563 5D

Treatment of Industrial Effluents by Flotation (Traitement d'effluents industriels par flottation),
W75-03569 5D

Measurements of Sludge Level and Sludge Density in Clarifier Installations (Messungen von Schlamminiveau und Schlammdichte in Klaeranlagen),
W75-03586 5D

Unique New Secondary Oxygen Treatment System for Effluent,
W75-03587 5D

Kentucky Pollution Abatement Authority,
W75-03707 6E

Replaces New Works 1900 Installation.
W75-03817 5D

Thermal Drying of Mechanically Dehydrated Urban Sewage Sludge in a Boiling Layer System (Termicheskaya sushka mekhanicheski obezvozhennykh osadkov gorodskikh stochnykh vod v kipyashchem sloye),
W75-03818 5D

TREES
The Nature of Water Potential Gradients in Trees, (In German),
W75-03336 2I

Physical Condition and Dimensions of Trees in Site 1 and the Control Area,
W75-03408 5C

Temporal and Spatial Patterns of Pretreatment Litter Production in Site 1 and the Control Area,
W75-03411 5C

TRICKLING FILTERS
Apparatus for Biologically Purifying Effluent,
W75-03734 5D

TRITIUM
Storage of Tritium and Noble Gases,
W75-03418 5D

TRITIUM

Estimation of Groundwater Accession to and Evaporation from a South Australian Lake Using Environmental Tritium,
W75-03528 2H

TROPICAL STORMS

Prediction of Subtropical Storm Soil Losses from Field Plot Studies,
W75-03806 2G

TROPOSPHERE

On the Spring Maximum of the Concentration of Trace Constituents in Atmospheric Precipitation,
W75-03621 5B

TUNA

Mercury in Tunas: A Review,
W75-03622 5C

TUNNEL LININGS

Testing and Evaluation of Prototype Tunnel Support Systems,
W75-03644 8F

TUNNEL SUPPORTS

Testing and Evaluation of Prototype Tunnel Support Systems,
W75-03644 8F

TUNNELS

Testing and Evaluation of Prototype Tunnel Support Systems,
W75-03644 8F

TURBIDITY

Changes in the Economy and Ecology at Proposed Lake Sites in the Salt River Basin, Kentucky, During Early Construction of the Dam for Taylorsville Lake,
W75-03309 5C

A Review of Turbidity Removal Associated With Biological Treatment of Paper Mill Wastewaters,
W75-03574 5D

TYPHA LATIFOLIA

Heavy Metal Tolerance in Typha Latifolia Without the Evolution of Tolerant Races,
W75-03513 5C

ULTRAFILTRATION

Ultrafiltration Offers 'Good' Removal of Color, COD, BOD.

WATER POLLUTION EFFECTS

Temperature Effect on Brain Glycogen of Fish,
W75-03447 5C

Advisory Report on Health Effects of Nitrates in Water.
W75-03484 5C

Environmental Aspects of Fin Erosion and Tumors in Southern California Dover Sole,
W75-03517 5C

The Toxicity of TNT and Related Wastes to an Aquatic Flowering Plant, Lemna Perpusilla,
W75-03523 5C

The Influence of a Paper Mill with Adjacent Coating Plant on the Biological Oxygen Demand of the Receiving Stream (Der Einfluss einer Papierfabrik mit angeschlossener Streicherei auf den biologischen Sauerstoffverbrauch des Vorfluters),
W75-03605 5B

WATER POLLUTION SOURCES

Pollutional Aspects and Crop Yields Resulting from High Manure Applications on Soil,
W75-03310 5B

Consolidation Techniques for Fuel Cladding Hulls,
W75-03416 5D

People v. Oceana Terminal Corp. (Prosecution for an Oil Spill).
W75-03456 6E

Ground-Water Quality Study,
W75-03534 5B

Water: Its Quality Often Depends on the Forester,
W75-03589 5B

A Study of Nitrilotriacetic Acid (NTA) Degradation in a Receiving Stream,
W75-03601 5B

The Influence of a Paper Mill with Adjacent Coating Plant on the Biological Oxygen Demand of the Receiving Stream (Der Einfluss einer Papierfabrik mit angeschlossener Streicherei auf den biologischen Sauerstoffverbrauch des Vorfluters),
W75-03605 5B

Ground-Water Quality Modeling,
W75-03661 5B

Hydrocarbon Dispersion in Ground Water: Significance and Characteristics,
W75-03662 5B

Agriculture's Pollution Solution for Lake Apopka,
W75-03686 5C

U.S. V. Colgate-Palmolive Co. (Action Charging Unlawful Discharge of Refuse Matter Into Navigable Waters),
W75-03702 6E

Committee For the Consideration of the Jones Falls Sewage System V. Train (Action Seeking Injunctive Relief Restraining the Granting of Sewer Hook-Up Permits),
W75-03710 6E

Gulf Oil Corporation, et al. v. Morton (Action for Writ of Mandamus).
W75-03721 6E

Pollutant Spill Prevention and Control Act (As Amended).
W75-03728 6E

A Study of Pollution Loadings from Urban Runoff,
W75-03772 5B

ATER POLLUTION TREATMENT
Treatment of Industrial Effluents by Flotation (Traitement d'effluents industriels par flottation),
W75-03569 5D

ATER POTENTIAL GRADIENTS
The Nature of Water Potential Gradients in Trees, (In German),
W75-03336 2I

ATER PROPERTIES
Determination of Total Water Hardness by Conductometric Titration with Complexing Agents (Determinarea duritatii toale a apei prin titrari conductometrice cu complexoni),
W75-03604 5A

ATER PURIFICATION
New Concepts for Clarification of Water Using Some Alternatives to Alum,
W75-03374 5D

Modified Cellulose Adsorbent for Removal of Mercury From Aqueous Solutions,
W75-03579 5D

Novel Methods of Freshwater Preparation and Waste Water Purification in Pulp and Paper Mills (Neuere Methoden zur Frischwasseraufbereitung und Abwasserreinigung in Zellstoff- und Papierfakriken),
W75-03602 5D

Method of Preparing Water Purification Membranes,
W75-03756 3A

The Effects of Aluminum Sludge from Water Purification on Municipal Primary Sewage Treatment,
W75-03778 5D

TER QUALITY
Water Quality Models for Urban and Suburban Areas.
W75-03311 5B

fluence of Fertilizer Practices on Water and e Quality of the Environment (Phase II),
75-03315 5B

he Delaware Estuary System, Environmental pacts and Socio-Economic Effects,
75-03352 6G

timation Theoretic Approach to Analysis, nthesis, and Solution of Dynamic Systems, rt I,
75-03387 5D

e Delaware Estuary System, Environmental pacts and Socio-Economic Effects. Upper tuary Pollution and Transfer Relationships,
75-03440 5B

atershed Protection and Flood Prevention ogram and Resource Conservation and velopment Program--Proposed Water Quali- Management Guidelines.
75-03491 5G

cent Developments in the New Zealand ck Oyster Farming Industry (1970-72) and oblems Regarding Aquatic Pollution,
75-03516 5C

ound-Water Quality Study,
75-03534 5B

e Influence of a Paper Mill with Adjacent ating Plant on the Biological Oxygen Demand of the Receiving Stream (Der Einfluss einer Papierfabrik mit angeschlossener Streicherei auf den biologischen Sauerstoffverbrauch des Vorfluters),
W75-03605 5B

Great Lakes Water Quality, 1973 Annual Report to the International Joint Commission.
W75-03640 5G

Ground-Water Quality Modeling,
W75-03661 5B

New Legislation for Water Quality.
W75-03679 5G

Chemical Analyses for Water Quality - Training Manual.
W75-03785 5A

WATER QUALITY CONTROL
The Delaware Estuary System, Environmental Impacts and Socio-Economic Effects. Upper Estuary Pollution and Transfer Relationships,
W75-03440 5B

Commonwealth v. Borough of Galeton (Petition to Enforce Clean Streams Law).
W75-03465 6E

Robert E. Nilles, Inc. v. Illinois Pollution Control Bd. (Action Against Pollution Control Board for Denial of Sewerage Permits).
W75-03474 6E

Agreement Between the United States of America and Canada on Great Lakes Water Quality.
W75-03480 5G

A Program for the Future--Water and Sewer in Rural America.
W75-03488 5D

A Study: Effects of Geology and Nutrients on Water Quality Development,
W75-03539 5G

Estuaries of Oregon-Ecosystems in Crisis, Problems and Legal Solutions,
W75-03678 5G

New Legislation for Water Quality.
W75-03679 5G

Interstate Mining Compact (As Amended),
W75-03708 6E

WATER QUALITY STANDARDS
Guidelines for Land Disposal of Feedlot Lagoon Water.
W75-03306 5G

Evaluation of the Georgia Water Supply Program.
W75-03435 5F

Guidelines for Development of Criteria for Control of Ocean Waste Disposal.
W75-03632 5E

Water Program Policy Issues, (EPA Policy Directives).
W75-03692 5G

Report of Proceedings at Public Hearing Concerning the Reclassification of Various Streams in the Cape Fear (Lower Section), Lumber, Neuse and White Oak River Basins.
W75-03717 4A

WATER RESOURCE DEVELOPMENT
Marginal Cost Estimates of the Water Resources of the USSR,
W75-03342 6B

WATER RESOURCES
Multilevel Approach for Regional Water Resources Planning and Management, Volume I,
W75-03434 6A

East Brimfield and Westville Reservoirs. Quantity and Value of Water Supply Storage. Quinebaug River--Massachusetts.
W75-03437 6D

Proposed Legislation for Artificial Groundwater Recharge,
W75-03489 4B

Lands Lying Under Public Waters.
W75-03671 6E

Groundwater Use Act of 1972.
W75-03722 6E

Water Recreation Act of 1973.
W75-03726 6E

Recent Limnological Studies of Okanagan Basin Lakes and Their Contribution to Comprehensive Water Resource Planning,
W75-03769 2H

WATER RESOURCES DEVELOPMENT
An Analysis of Social Well-Being Change Associated with Resource Development Projects in Wyoming,
W75-03319 6B

A Note on the Evaluation of Activity Dependent Recreational Damage Cost Functions,
W75-03341 6D

Economic Development and Water Resources Investments,
W75-03343 6B

The Influence of Recent Trends in Water Legislation on the Structure and Functions of Water Administration,
W75-03363 6E

Watershed Protection and Flood Prevention Program and Resource Conservation and Development Program--Proposed Water Quality Management Guidelines.
W75-03491 5G

WATER RESOURCES INSTITUTE
Publications List of the Idaho Water Resources Research Institute.
W75-03321 10C

WATER REUSE
Purified Wastewater-The Untapped Water Resource,
W75-03337 5D

Proposed Legislation for Artificial Groundwater Recharge,
W75-03489 4B

Municipal Wastes - A Design for an Integrated Plant to Make a Profit,
W75-03531 5D

Aerobic Wastewater Treatment System with Partial Reuse and Infrequent Dosing to Soil,
W75-03741 5D

Powered Mobile Spray Irrigation for Productive Crop Sewage Utilization,
W75-03743 5D

WATER REUSE

Method of Preparing Water Purification Membranes,
W75-03756 3A

Recycling Milling Water in Missouri's New Lead Belt,
W75-03799 5D

WATER RIGHTS

Jewett v. Redwater Irrigating Association (Action for Adjudication of Water Rights).
W75-03471 6E

Clio Nods: Arizona v. California and the Boulder Canyon Act - A Reassessment,
W75-03801 6E

WATER RIGHTS (NON-RIPARIANS)

Compensatory Storage,
W75-03676 6E

Jones v. Scott (Action Claiming Prescriptive Right in Public over Navigable Water).
W75-03712 6E

WATER SAMPLING

A Study of Adsorption Characteristics of Traces of Chromium(III) and (VI) on Selected Surfaces,
W75-03613 5A

WATER SHEDS (BASINS)

Study of Drainage Patterns in the Mahanadi Catchment (Above Hirakud Dam),
W75-03835 4D

WATER SOURCES

East Brimfield and Westville Reservoirs. Quantity and Value of Water Supply Storage. Quinebaug River--Massachusetts.
W75-03437 6D

WATER STORAGE

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Second Annual Report Year Ended June 1970.
W75-03433 5G

Moss Rose Manufacturing Co. v. Foster (Action for Recovery of Water Damage Caused by Seepage).
W75-03455 6E

Compensatory Storage,
W75-03676 6E

WATER STRESS

Effect of Water Stress Upon Endogenous Ethylene Levels in Vicia Faba,
W75-03841 2I

WATER STRUCTURES

Lands Lying Under Public Waters.
W75-03671 6E

WATER SUPPLY

Light and Water Supply as Factors Influencing the Degree of Stomatal Opening in Conifers, (In German),
W75-03338 2I

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Fifth Annual Report, Year Ended 30th June 1973.
W75-03432 5G

Metropolitan Water Sewerage and Drainage Board, Sydney, Eighty-Second Annual Report Year Ended June 1970.
W75-03433 5G

East Brimfield and Westville Reservoirs. Quantity and Value of Water Supply Storage. Quinebaug River--Massachusetts.
W75-03437 6D

McCall v. Presley (Seeking Mandamus for Issuance of Building Permit).
W75-03457 6E

Advisory Report on Health Effects of Nitrates in Water.
W75-03484 5C

The Sewage System of the City of Rangoon,
W75-03544 5D

Altering Alabama's History,
W75-03688 4A

WATER SUPPLY DEVELOPMENT

Purified Wastewater-The Untapped Water Resource,
W75-03337 5D

Future of Desalting is Bright but Costs Must Drop,
W75-03356 3A

WATER SUPPLY SURVEILLANCE

Evaluation of the Georgia Water Supply Program.
W75-03435 5F

WATER TEMPERATURE

Temperature Effects on Growth and Respiration Rates of Dolania Americana (Ephemeroptera),
W75-03510 5C

Calculation of Temperature Variations of Small Mountain Streams,
W75-03655 2E

WATER TREATMENT

Alum Recovery from Water and Wastewater Treatment Plant Sludges,
W75-03542 5D

Beneficiation of Lignin Solutions and Pulp Mill Wastes,
W75-03593 5D

WATER USERS

Evaluation of the Georgia Water Supply Program.
W75-03435 5F

WATER UTILIZATION

Dams.
W75-03672 6E

Defoliation, Leaf Area Index, and the Water Use of Four Temperate Pasture Species Under Irrigated and Dryland Conditions,
W75-03848 3F

WATER WORKS

The Microflora in the Settling and Subsoil Water Enriching Basins of the Budapest Waterworks,
W75-03763 5C

WATER YIELD

Watershed Behavior After Forest Fire in Washington,
W75-03820 4C

WATER YIELD IMPROVEMENT

Opportunities for Watershed Management in Wyoming,
W75-03326 4D

Chaparral Conversion Potential in Arizona. I. Water Yield Response and Effects on Other Resources,
W75-03572 3B

Chaparral Conversion Potential in Arizona. II. An Economic Analysis,
W75-03573 3B

WATERSHED MANAGEMENT

Opportunities for Watershed Management in Wyoming,
W75-03326 4D

Rapid Creek Flood Hazard Analyses-(Including Inman Creek and West Fork Creek Tributaries) Bannock County, Idaho.
W75-03438 4A

Flood Hazard Analyses - City of Lisbon, Ransom County, North Dakota.
W75-03439 4A

Evolution of the Small Watershed Program, Changes in Public Law 566--Watershed Protection and Flood Prevention Program, 1954-72,
W75-03483 4D

Chaparral Conversion Potential in Arizona. I. Water Yield Response and Effects on Other Resources,
W75-03572 3B

Chaparral Conversion Potential in Arizona. II. An Economic Analysis,
W75-03573 3B

Altering Alabama's History,
W75-03688 4A

Study of Drainage Patterns in the Mahanadi Catchment (Above Hirakud Dam),
W75-03835 4D

WATERSHED PROTECTION AND FLOOD PREVENTION ACT

Evolution of the Small Watershed Program Changes in Public Law 566--Watershed Protection and Flood Prevention Program, 1954-72,
W75-03483 4D

WATERSHEDS (BASINS)

Hydrologic Simulation of a Complex Watershed,
W75-03325 2A

Survey of Erosion and Land Use Within the Catchment Area of Keepit Dam (Australia) Part 1 - Climate, Geology, Soils,
W75-03530 4I

A Study: Effects of Geology and Nutrients o Water Quality Development,
W75-03539 5C

A Look at Legislation Defining Uses of Na tional Forest Lands, Part Two,
W75-03685 6

The Hydrology of a Small Catchment Basin Samaru, Nigeria: III. Assessment of Surfac Run-Off Under Varied Land Management an Vegetation Cover,
W75-03765 4

WAVE ACTION

Anti-Erosion Device,
W75-03742

WAXING

Hydration of Eastern Hemlock as Influenc by Waxing and Weather,
W75-03500

WEATHER
Hydration of Eastern Hemlock as Influenced by Waxing and Weather,
W75-03500 2I

WEATHER MODIFICATION
Twelve Basin Investigation: Analysis of Potential Increases in Precipitation and Streamflow Resulting from Modification of Cold Orographic Clouds in Selected River Basins of the Western United States. Volume 2,
W75-03639 3B

WELL CONSTRUCTION
Evaluating Well Construction, (Part II),
W75-03813 5B

WELL DATA
Collection and Analysis of Pump Test Data for Transmissivity Values,
W75-03421 5B

WEST GERMANY (CONSTANCE)
Investigations on Aerobic Pectolytic Bacteria in an Eutrophic Lake, (In German),
W75-03538 5C

WEST GERMANY (LAKE URSEE)
Solution, Diffusion and Sorption in Upper Layer of Lake Sediments: III. Chemical and Physical Conditions in Sediment-Water Transition Zone of Meromictic BOG Late (Ursee) and its Relation to Accumulation of Vivianite, (In German),
W75-03571 5B

WET AIR OXIDATION
Removal of Phenol in Waste Water by Wet Air Oxidation,
W75-03779 5D

Wet Air Oxidation of Low Molecular Weight Organic Acids,
W75-03783 5D

WET WASTE TANKERS
Talking Tankers.
W75-03560 5E

WETTING FRONT
Axisymmetric Infiltration in Soils, II. Summary of Infiltration Characteristics Related to Problem Specifications,
W75-03670 2G

WHEAT
Relationships Between Moisture Availability and Nitrogen Response in Winter Wheat,
W75-03307 3F

Utility of a Simple Soil Water Budget Model in Agronomic Research: I. Effects of Plant Density, Time-of-Sowing and Fallow Water on Available Soil Water Under Spring Wheat,
W75-03450 3F

Cadmium Uptake by Wheat from Sewage Sludge Used as a Plant Nutrient Source: A Comparative Study Using Flameless Atomic Absorption and Neutron Activation Analysis,
W75-03503 5A

WILDERNESS ACT
A Look at Legislation Defining Uses of National Forest Lands, Part Two,
W75-03685 6E

WILDLIFE
Vertebrates of the Enterprise Forest: A General Survey,
W75-03413 5C

Small-Mammal Populations in Site 1 and the Control Area,
W75-03414 5C

U.S. v. Cappaert (Action by U.S. to Have its Rights to Use of Appurtenant Waters Declared).
W75-03723 6E

WILLAMETTE RIVER (ORE)

CENTERS OF COMPETENCE
AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 8, NUMBER 8
APRIL 15, 1975

THE LIBRARY OF THE
JUN 10 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W75-03851 -- W75-04350

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 8, NUMBER 8
APRIL 15, 1975

W75-03851 -- W75-04350

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education–Extramural; Education–In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ABSTRACT SOURCES

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

PHYSICAL PROPERTIES OF OXYGEN-17 WATER: ABSOLUTE VISCOSITY AND DENSITY OF H2(17)0 BETWEEN 15 AND 35C,
Weizmann Inst. of Science, Rehovot (Israel) Dept. of Isotope Research.
A. I. Kudish, D. Wolf, and F. Steckel.
Journal of the Chemical Society (London), Faraday Transactions I, No 3, p 484-489, 1974. 6 tab, 8 ref.

Descriptors: *Water properties, *Viscosity, *Density, *Isotope studies, Physicochemical properties, Heavy water, Deuterium, Oxygen isotopes, Temperature.

The absolute viscosity of four oxygen-17 water samples is reported at 5C intervals between 15 and 35C. The absolute viscosity of 100% H2(17)O is determined by extrapolation of the measured viscosity of a highly enriched oxygen-17 sample containing 86.53% O(17). The values calculated for the other samples, based on Eyring's viscosity theory, are in excellent agreement with experimental results. The isotope effect for H2 (17)O relative to natural water has been analyzed. Viscosity ratios at 25C are 1.0226 for O(17)/O(16) water, 1.0536 for O(18)/O(16) water, and 1.2316 for D2O(16)/H2O(16). STOCHASTIC MODELS FOR THE INTERACTION OF RAINFALL AND GROUNDWATER LEVELS,
Purdue Univ., Lafayette, Ind.
A. Ramachandra Rao, R. L. Kashyap, and R. G. Srinivasa Rao.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 181, $3.25 in paper copy, $2.25 in microfiche. Paper presented at International Symposium on Development of Ground Water Resources, 1973, 15 p, 12 fig, 6 ref. OWRR C-3277(No 3713)(3).

Descriptors: *Groundwater, *Groundwater recharge, *Water table, Aquifers, *Precipitation, *Statistical models, Groundwater movement, Water table, Stochastic processes, Mathematical studies, Correlation analysis, Model studies.
Identifiers: *Stochastic models, Multivariate models, Univariate models, Transformed variant, Phase-spectrum test, Correlogram test, Co-spectrum test.

Aquifers are recharged by precipitation and, where the circumstances are favorable, by streamflow. Both rainfall and streamflow are considered as stochastic processes. Consequently, the recharge of an aquifer by rainfall of streamflow must also be considered as a stochastic process. Some preliminary results in developing stochastic models for the interaction of rainfall and groundwater level process are presented. Formulation and validation of univariate and multivariate models are discussed. The parameter estimation in multivariate models is discussed in detail. Because of availablility elsewhere, the parameter estimation of the univariate models is brief. The validation of both the univariate and multivariate models is dealt with in detail because of its obvious importance in model construction. Two conclusions are presented. Valid univariate models with excellent one step-ahead prediction capabilities can be developed for modelling the ground water level process. Because of its random nature, at least for the data analyzed in the present study, rainfall does not appear to be very significant in modelling the ground water level process.
W75-03949

WORLDWIDE DISTRIBUTIONS OF MEAN MONTHLY DEWPOINT,
Army Engineer Topographic Lab., Fort Belvoir, Va.
H. L. Ohman.
Department of the Army, U.S. Army Engineer Topographic Laboratories. Geographic Sciences Laboratory, Report No. ETL-SR-74-2, November, 1973, 28 p 12 fig, 14 refs.

Descriptors: *Dew point, *Isotherms, *Maps, *Distribution patterns, *Design criteria, Temperature, Elevation, Moisture availability, Vegetation, Monthly.

Twelve global maps showing the mean monthly dewpoint temperatures for each month are presented. The distributional characteristics were found to be influenced primarily by air temperature, distance from and degree of exposure to moisture surfaces, and the depressing effects of elevation. The maps for January and July provided estimates for the mean annual range of dewpoint temperature which can be useful in design engineering purposes. (Mastic-Arizona)

THE NONLINEAR RAINFALL RESPONSE OF WATERSHEDS WITH TIME DEPENDENT STORAGE AND CONVEYANCE PROPERTIES,
Cincinnati Univ., Ohio. Dept. of Engineering Analysis.
A. M. Strauss.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 361-366. 7 ref.

Descriptors: *Rainfall-runoff relationships, *Estimating equations, Mathematical models, *Time series analysis, Analytical techniques, Watersheds(Basins), Storage, Hydrologic systems.
Identifiers: *Nonlinear rainfall response, *Time dependence, Conveyance properties.

The time variability of watersheds must be taken into account if a watershed is to be accurately modeled. Mathematical formulae quantifying presently acceptable rainfall-runoff and general hydrological systems were presented and tempered in a manner to account for observed time dependent properties. Long term models, especially, must take into account such natural processes as weathering, erosion, and climatic change. Coupling these with the effects of man's activities, it was suggested that one watershed ageing term be used when modifying current methods. (See also W75-04213) (Jess-ISWS)
W75-04240

A DISCRETE LINEAR MODEL FOR THE HYDROLOGIC BASIN,
Indian Inst. of Tech., Kanpur. Dept. of Civil Engineering.
S. Ramaseshan, U. C. Chaube, and A. K. Sharma.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 367-376. 2 fig, 1 tab, 17 ref.

Descriptors: *Hydrologic systems, *Rainfall-runoff relationships, *Model studies, Digital computers, Water loss, Storm runoff, Surface runoff, Recharge, Bank storage, Peak discharge, Hydrology, Mathematical models, *Model studies.
Identifiers: *Discrete linear model, Time series model, Differential model.

The data used in hydrologic analyses are generally discrete and facilitate the use of digital computers for their solutions. A discrete linear model for the hydrologic basin was presented. It was essentially a time series model and could be related to the differential model of Chow and Kulandaiswamy. With a discrete data representation of the process and a finite order of the model, detection of component processes like abstraction and apparent effective rainfall was attempted on the basis of the fitted model. It was indicated that abstraction is present even after the end of a storm and that recharge from bank storage and/or interflow is present generally after a flood peak. A descriptive model to explain the physical process was suggested. The procedure was illustrated with an example. (See also W75-04213) (Singh-ISWS)

GROUNDWATER STORAGE-RIVERFLOW RELATIONS IN A CHALK CATCHMENT,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
S. S. D. Foster.
Journal of Hydrology, Vol 23, No 3/4, p 299-311, 1974. 5 fig, 2 tab, 8 ref.

Descriptors: *Base flow, *Surface-groundwater relationships, *River flow, *Watersheds(Basins), *Water storage, Transmissivity, Specific yield, Storage coefficient, Mathematical models, Recession curves, Water level fluctuations, Stage-discharge relations.
Identifiers: *United Kingdom(Hull River), Linear reservoirs, Chalk catchments.

Data from continuously monitored observation boreholes and the permanent river gaging station in the West Beck catchment of the East Yorkshire Chalk were presented and analyzed. Layered hydraulic structure in the chalk aquifer was reflected in the form of and correlation between recession characteristics. A series of fairly well defined linear storage elements, each with differ-

ing coefficients of permeability and storage, appeared to be present. The distribution and variation of storage and permeability with depth may be critical factors in catchments such as this, where schemes for augmentation of drought riverflows from groundwater storage are under consideration or in pilot development. (Visocky-ISWS)

THE UNIT HYDROGRAPH: A SATISFACTORY MODEL OF WATERSHED RESPONSE,
Massey Univ., Palmerston North (New Zealand). Dept. of Geography.
R. G. Heerdegen.
Water Resources Bulletin, Vol 10, No 6, p 1143-1161, December 1974. 2 fig, 6 tab, 38 ref.

Descriptors: *Unit hydrographs, *Storm runoff, *Hydrograph analysis, Surface runoff, Streamflow, Hydrographs, Hydrology, Runoff, *Watersheds(Basins), *Pennsylvania, Seasonal, Climatic data, *Least squares method, Model studies, Mathematical models, Floods.
Identifiers: Watershed response, Watershed parameters.

Some 96 flood events larger than the mean annual flood from 16 watersheds in the Commonwealth of Pennsylvania were used to derive unit hydrographs by the least-squares method. Analyses of the unit hydrographs were conducted to ascertain their response to watershed parameters, climatic and storm variables, and locations within different hydrologic regions. Significant differences both within and among watersheds led to the formulation and testing of hypotheses stating that differences among watersheds are caused by physiographic differences while differences within watersheds result from climatic and storm differences. The analysis showed that while many watersheds parameters strongly influence the shape of the unit hydrograph, only the storm variables duration and volume of precipitation excess produce significant differences. Seasonal differences were apparent but not proven statistically significant. (Terstriep-ISWS)

STOCHASTIC SIMULATION OF DAILY RAINFALL,
Kentucky Water Resources Inst., Lexington.
D. M. Allen, C. T. Haan, D. Linton, J. Streeb, and D. Jordan.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 268, $5.25 in paper copy, $2.25 in microfiche. Research Report No. 82, 1975. 112 p, 1 fig, 13 tab, 8 ref, 4 append. OWRT A-045-KY(1). 14-31-0001-3817, and 14-31-0001-4017.

Descriptors: Simulation analysis, *Rainfall disposition, Hydrology, Precipitation(Atmospheric), Rainfall, *Stochastic processes, *Markov processes, Distribution patterns, *Kentucky, *Model studies, Water supply, Design, Probability.

The design of many water resources projects requires knowledge of possible long-term rainfall patterns. A stochastic model based on a first order Markov chain was developed to simulate daily rainfall at a point. The model is applicable to any point in Kentucky (and other areas with similar rainfall patterns). The model in its present form is useful in providing rainfall inputs into hydrologic models for designing water supply facilities and other water resources systems. The model uses historical rainfall data to estimate the Markov transitional probabilities. A separate matrix is estimated for each month of the year. In this report 7 x 7 transitional probability matrices were used. The model is capable of simulating a daily rainfall record of any length based on the estimated transitional probabilities and frequency distributions of rainfall amounts within each class interval. The simulated data are statistical properties similar to historical data. (Grieves-Kentucky)

SOME CHARACTERISTICS OF UPPER CLOUDS AND SUGGESTIONS REGARDING THE UTILIZATION OF RADIOACTIVE TRACERS IN MERIDIONAL FLOWS,
N. N. Romanov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 40-41.

Descriptors: *Meteorology, *Radioactivity, *Tracers, *Climatology, *Clouds, *Weather, *Winds, Air circulation, Research equipment, Aircraft, Latitudinal studies.

The analysis of numerous reports of aircraft pilots and observations during research flights in TU-104 and IL-18 aircraft led to the establishment of a relationship between the development of upper clouds and the direction of wind with a large meridional component. Independently of the character of the baric field, the clouds develop under southern and southwestern stable flows and are destroyed (or are absent) by northern and northeastern flows. This relationship is expressed more strongly in low latitudes and is weaker in high latitudes. It is assumed that such a relationship results from stable vertical currents of positive or negative sign, appearing in meridional flows on the rotation Earth. It is suggested that direct measurement of vertical motions be conducted with the aid of radioactive tracers during a rationally selected synoptic situation. (See also W75-04054) (Houser-ORNL)
W75-04059

MEAN AND TURBULENT TRANSFER OF SUBSTANCES OVER THE USSR,
I. G. Guterman.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 42-56, 10 fig, 1 tab, 13 ref.

Descriptors: *Meteorology, *Climatology, *Winds, *Turbulence, Movement, *Mixing, *Boundary layers, *Moisture, Humidity, Precipitable water, Measurement, Atmospheric pollution, Height, Seasonal, Temperature.
Identifiers: *USSR, Fluxes.

The relation is examined between the mean and turbulent fluxes of substances at the limit of the atmospheric boundary layer (1.5 km) in January and July over the USSR. The intensity of macroturbulent fluctuations, characterized by the ratio of the vectorial standard deviation of wind Sigma (sub v) to the modulus of the resultant wind (absolute value of vector V (sub r)), is equal to 100-500% in winter and 200-2,000% in summer. This results mainly from the decrease in mean transfer, since the macroturbulent component of the motion Sigma(sub v) in summer is of the same order as in winter. Turbulent heat fluxes in January hardly attain 1-3% of the fluxes due to the mean motion, while in July this ratio increases to 4-7%. Therefore, the practically horizontal heat fluxes at that level can be calculated from data on the mean temperature and resultant wind. The streamlines of turbulent heat fluxes coincide with the direction of the temperature gradient and, over the USSR in both January and July, are generally opposite to or intersect at right angles the streamlines plotted on the basis of the average wind speed vector. Hence the total heat fluxes are vectorially somewhat smaller than the mean heat fluxes. Horizontal turbulent moisture fluxes make a more important contribution to the total moisture flux. At 1.5 km, the ratio of the turbulent moisture flux to the moisture carried by the mean motion fluctuates between 20 and 180%, and in July between 40 and 140%. (See also W75-04054) (Houser-ORNL)

SOME THEORETICAL NOTIONS OF RADIOACTIVITY ACQUISITION BY RAINDROPS,
For primary bibliographic entry see Field 5B.
W75-04072

DISTRIBUTION OF RAINDROPS WITH RESPECT TO SPECIFIC RADIOACTIVITY,
B. I. Styro, and B. K. Vebrene.
In: Nuclear Meterology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 133-136, 4 fig, 2 ref.

Descriptors: *Meteorology, *Nuclear energy, *Radioactivity, *Radioisotopes, Distribution, *Raindrops, Analytical techniques, Density, Fallout, Clouds, Air circulation, Polonium, Research and development, Mathematics.
Identifiers: Specific radioactivity.

The distribution of raindrops was investigated with respect to their specific radioactivity. The distribution curves of droplets are similar for a uniform distribution of the isotope and when it is introduced at some point in the cloud. The position of the maximum on the curve depends on the isotope quantity. The variation in the specific radioactivity of rain during its fall was also investigated. The first specific radioactivity maximum appears several minutes after the isotope is introduced in the cloud. The second, not so sharp maximum appears after 10-15 minutes. The very rapid (3-4 min) appearance of activated droplets at the earth's surface is associated with the accelerating effect of descending air currents. (See also W75-04054) (Houser-ORNL)

OBJECTIVE DOUBLE-MASS ANALYSIS,
West Virginia Univ., Morgantown. Water Research Inst.
M. Chang, and R. Lee.
Water Resources Research, Vol 10, No 6, p 1123-1126, December 1974. 3 fig, 5 tab, 5 ref.

Descriptors: *Mass curves, *Precipitation(Atmospheric), *Gaging stations, *Relocation, Computers, Statistical methods, Hydrologic data, Methodology, Spatial distribution, Analytical techniques, Topography, *Time series analysis.
Identifiers: Consistent simultaneous series, Multiple inconsistencies, Subjective methods, *Data analysis.

The consistency of an observed time series was tested by double-mass analysis with an appropriate and consistent simultaneous series. Partially inconsistent series were adjusted to relative consistency with the simultaneous series. A general, completely computerized method of double-mass analysis was devised to reduce subjectivity to a minimum. The only subjective assumptions retained were that a proportionality change in annual data is worthy of note if it persists for at least 5 years and that the statistical significance of a proportionality change (at any selected alpha level) was a necessary and sufficient reason for adjusting the data of the inconsistent partial series. A general technique for handling multiple inconsistencies was developed. Data inconsistency tests suggested important physical causes for the deviations. Site and gage exposure parameters, in conjunction with local precipitation data, explained much of the statistical variability in the characteristic spatial distribution of annual precipitation in mountainous areas. (Singh-ISWS)

THE USE OF STEREO, HORIZONTAL, AND GROUND LEVEL ORIFICE GAGES TO DETERMINE A RAINFALL-ELEVATION RELATIONSHIP,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
B. Sevruk.
Water Resources Research, Vol 10, No 6, p 1138-1141, December 1974. 3 fig, 1 tab, 39 ref.

Descriptors: *Mountains, *Precipitation(Atmospheric), Alpine, Statistical methods, Rainfall, Winds, Networks, *Rain gages, Watersheds(Basins), Measurement, *Instrumentation.
Identifiers: *Rainfall-elevation relationships, Storage gages, Wind shields, *Stereo orifices, *Switzerland(Baye de Montreux).

In the range of altitude from 1100 to 1850 m above sea level the mean rainfall totals over a 10-year period from June to September as measured by means of 22 storage gages with horizontal orifices and wind shields generally decreased with increasing elevation in the upper part (6.8 sq km) of the prealpine watershed of Baye de Montreux. The substitution of a stereo orifice for the horizontal one on the nine gages located on the slopes open to rain-bearing winds resulted in a slightly increasing mean rainfall catch with increasing elevation (r = 0.430). After 23 ground level stereo gages were set up in the watershed, a visible improvement in the rainfall-elevation relationship was registered (r = 0.710). (Jones-ISWS)

DEEP SNOW MEASUREMENTS SUGGESTED USING COSMIC RADIATION,
National Weather Service, Silver Spring, Md.
V. C. Bissell, and Z. G. Burson.
Water Resources Research, Vol 10, No 6, p 1243-1244, December 1974. 2 fig, 8 ref.

Descriptors: Snow, Instrumentation, *Radiation, *Water equivalent, *Snow cover, Attenuation, Soil moisture, Statistical methods, *Measurement, *Nevada.
Identifiers: *Lake Mead(Nev), Cosmic radiation.

The attenuation of highly penetrating cosmic radiation shows promise as a means of measuring the water equivalent of snow cover. The attenuation of cosmic radiation by water is sufficient to make the method practicable, especially for deep snow. As an example, statistical counting errors in a two-detector setup (with 10 cm by 10 cm NaI(Tl) scintillation detectors, one above the snow and one beneath the snow) would produce a water equivalent measurement accuracy of better than 1% in measuring 100 cm of water with a 24-hour measurement time. (Jones-ISWS)

2D. Evaporation and Transpiration

AN ENERGY PARTITION EVAPORATION RECORDER,
Commonwealth Scientific and Industrial Research Organization, Mordiallc (Australia). Div. of Atmospheric Physics.
A. C. Dilley.
Division of Atmospheric Physics CSIRO Australia Technical Paper No 24, 1974. 25 p, 17 fig, 15 ref.

Descriptors: *Monitoring, *Evaporation, *Evaporimeters, *Energy budget, Radiation, Heat transfer, Hygrometry, Water vapor, Measurement, Instrumentation, Logging(Recording), On-site tests.

An instrument is described which provides a near-continuous measurement of evaporation from natural surfaces. The instrument employs a resistive bridge technique to sense net radiation, ambient wet-bulb temperature and dry- and wet-bulb temperature differences, and employs a servo-balance system to combine the corresponding electrical signals according to a modified version of the energy balance formula. Details are given of the instrument's construction, calibration, field operation and performance. (Levick-CSIRO)

EFFECTS OF LOW WATER POTENTIALS ON TRANSPIRATION AND PHOTOSYNTHESIS IN MITCHELL GRASS (ASTREBLA LAPPACEA),
Queensland Univ., Brisbane (Australia). Dept. of Botany.
D. Doley, and N. B. A. Trivett.
Australian Journal of Plant Physiology, Vol 1, No 4, p 539-550, December 1974. 8 fig, 1 tab, 33 ref.

Descriptors: *Range grasses, *Australia, *Drought tolerance, Leaves, Stomata, Transpiration control, *Transpiration, *Photosynthesis, Pastures, Semiarid climates, Moisture stress.
Identifiers: *Mitchell grass, Astrebla lappacea, Queensland.

The Mitchell grasses are an important component of the dry season forage of central and western Queensland (Australia), and curly Mitchell grass, Astrebla lappacea, is the dominant species of the association in drier sites. Preliminary studies are reported on the effects of reduced leaf water potential on gas exchange in this species. Close linear relationships were established between leaf water potential and both transpiration and net photosynthesis; most of the variation in gas exchange could be attributed to changes in stomatal diffusion resistance. Gas exchange exhibited a remarkable recovery after brief but severe drought, although there was some inhibition of both transpiration and photosynthesis for about one week following rewatering. It is concluded that A. lappacea demonstrates a high degree of true drought tolerance. (Levick-CSIRO)

THE THREE STAGES OF DRYING A FIELD SOIL,
Agricultural Research Service, Phoenix, Ariz., Water Conservation Lab.
S. B. Idso, R. J. Reginato, R. D. Jackson, B. A. Kimball, and F. S. Nakayama.
Soil Science Society of America, Proceedings, Vol 38, No. 5, September-October, 1974. p 831-837, 6 fig, 19 ref.

Descriptors: *Evaporation, *Soil moisture, *Albedo, *Moisture content, *Drying, Soil surfaces, Soil temperature, Clay loam, Solar radiation, Dry farming, Irrigation, *Arizona.

Drying experiments were conducted on a smooth, bare field of clay loam during all seasons at Phoenix, Arizona. Measurements were made of evaporation, Soil-water contents, soil temperature, soil heat flux, albedo, and net radiation. From these measurements, three stages of soil drying were outlined. The first stage was characterized by potential evaporation. The second stage was characterized by drying of the soil surface, and significantly reduced evaporation. Stage three appears to begin when the surface water content corresponds to a retention of two molecular layers of water about the soil particles at that level; a

value of about 0.06 in this soil. A rewetting of the soil surface at night may reinstate stage two drying on the following morning after stage three initiation. Simple albedo measurements often predicted the transition points between the different stages. (Mastic-Arizona)

OPEN CHANNEL FLOW EVAPORATION STUDY,
Bonneville Power Administration, Portland, Oreg.
J. R. Liaw.
Intern Report, September 1973. 112 p, 23 fig, 3 tab, 47 ref.

Descriptors: *Evaporation, *Rivers, *Thermodynamics, *Numerical analysis, Energy equation, Equations, Analysis, *Oregon, Continuity equation, Winds, Meteorological data, Temperature, On-site investigations.
Identifiers: Conservation equations, Ideal gas law, *Little Deschutes River(Ore), Kinetic theory of gases.

A better understanding of evaporation from the surface of a non-stationary water body has been needed for accurate water temperature forecasting and evaporation-loss prediction. An entirely new formula was postulated by combining kinetic molecular theory, conservation of mass and energy, and the ideal gas law. This formulation was tested by using 3-hour data from the Little Deschutes River in Oregon for July 29-31, 1969. The new evaporation equation is deterministic, but it includes a dynamic wind function. The determination of the 3 dynamic coefficients for the wind function was done by an original approach. The numerical solution required basic matrix theory, the Newton-Raphson iteration scheme, and a finite difference approximation to the one-dimensional first law of thermodynamics. (Adams-ISWS)

THE HYDRAULIC GEOMETRY OF A DISCONTINUOUS EPHEMERAL STREAM IN A BAJADA NEAR TUCSON, ARIZONA,
Arizona Univ., Tucson. Dept. of Geosciences.
F. A. Packard.
PhD/Dissertation 1974. 127 p, 20 fig, 2 tab, 27 ref.

Descriptors: *Ephemeral streams, *Streamflow, *Hydrology, *Channel morphology, *Model studies, *Hydrologic models, Geomorphology, Alluvial fans, Alluvium, Alluvial channels, Gullies, Braiding, Chutes, Perennial streams, Channeling, Valleys, Regression analysis.
Identifiers: Bajada, Hydraulic geometry.

An attempt was made to extend knowledge of the relationships among deposition, scour, morphology, and hydraulics along ephemeral discontinuous streams; develop a model for the alluviation of valleys by discontinuous streams; provide analogies between the study stream and descriptions of perennials streams; and clarify the role of discontinuous channels in the evolution of flat, grass-covered sheetflood valleys to gullied valleys. A detailed description of a discontinuity within the study area is presented with information on braid-chute units, flow data and a comparison of flow data along braid and chute reaches. Also discussed in detail is the morphology and hydrology of a fan within the study area and included is a proposed theoretical model for valley alluviation by an ephemeral discontinuous stream. FLOOD PLAIN INFORMATION: NORTH RUN, HENRICO COUNTY, VIRGINIA,
Army Engineer District, Norfolk, Va.
F. B. Proctor.
February, 1966. 12 p, 3 fig, photos; Technical Appendix, 25 p, Illus.

Descriptors: *Flood forecasting, *Flood plain zoning, *Flood profiles, Flood damage, Obstruction to flow, Land use, Planning, Virginia.
Identifiers: *North Run(Virginia), *Thorpe Branch(Virginia), *Rocky Branch(Virginia), *Hungary Creek(Virginia), *Henrico County, Richmond, Flood plain management, '50-year flood', Standard Project Flood.

Flood plains along North Run and its main tributaries, Thorpe Branch, Rocky Branch, and Hungary Creek, are very steep, with relatively narrow stream channels. Classified as essentially suburban with respect to development, the watershed still has large areas of woods and dense undergrowth. Due to its proximity to Richmond, it is expected that development will continue at an accelerated rate with resultant serious flood problems unless measures are taken to keep flood damage to a minimum. Extreme floods may be caused by storms which produce rainfall over a period of 6 hours or less. Both natural and man-made features may create obstructions to flow. No records of flooding or public awareness of the flood problem exist since in prior years the area was sparsely settled. Flood flows used in this study are based on flow records on small watersheds in the surrounding areas. At the mouth of North Run, the expected peak discharge of a '50-year flood' is 7,700 cfs and of a Standard Project Flood (SPF) is 16,200 cfs. Ways and means of preventing future damage on the flood plains are discussed in the technical appendix which also includes flood profiles, rainfall data and discharge estimates. If the watershed and flood plains are developed properly, there should be no need for flood control structures. (Diefendorf-North Carolina)
W75-04208

FLOOD PLAIN INFORMATION: GILLIES CREEK, HENRICO COUNTY, VIRGINIA.
Army Engineer District, Norfolk, Va
F. B. Proctor.
October, 1966. 12 p, 3 fig, technical append, photos.

Descriptors: *Flood forecasting, *Flood plain zoning, *Flood profiles, Obstruction to flow, Land use, Planning, Flood warning, Virginia.
Identifiers: *Gillies Creek(Virginia), *Henrico County(Virginia), *Lawndale Farms Branch(Virginia), *Hechler Village Branch(Virginia), Flood plain management, Standard Project Flood, '50-Year Flood', Richmond(Virginia).

The area included is a portion of Henrico County which is being rapidly developed as the housing areas push outward from Richmond. Main stream channels of Gillies Creek and its two tributaries, Lawndale Farms Branch and Hechler Village Branch, are relatively shallow and overgrown with dense vegetation. This vegetation along with 13 bridges and culverts and 2 dams create obstructions to flood flow. There are no records of flooding or public awareness of the flood problem since flooding in prior years was largely unnoticed because the area was sparsely settled. Due to lack of records of flood experience, flood flows used in the study are entirely computed based on rainfall records and on flow records of surrounding streams. At the mouth of Gillies Creek, a '50 Year Flood' would reach a peak discharge of 6,900 cfs and a Standard Project Flood (SPF) would reach 15,850 cfs. Probable flood lines are presented for use as a guide to be considered in controlling construction on the flood plain and to inform the public on the possibility of flooding. Many of the following ways of preventing future damage on flood plains have been initiated: flood plain zoning, building codes, sub-division regulations, flood plain evacuation, flood proofing. However, as far as is known, there are no existing, planned or authorized flood control works. (Diefendorf-North Carolina)

A SET OF REGIME EQUATIONS FOR INDIRECTLY ESTIMATING STREAM FLOW CHARACTERISTICS,
Ohio River Basin Commission, Cincinnati.
R. A. Joering, and H. C. Preul.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 1-426. 5 fig, 1 tab, 20 ref.

Descriptors: *Channel morphology, *Alluvial channels, *Estimating equations, *Streamflow, *Channels, Regime, Channel flow, Discharge(Water), Depth, Slopes, Width, Roughness(Hydraulic), Hydraulics, Sediment transport, Annual flood, Runoff, Velocity.
Identifiers: *Hydraulic geometry, Ungaged watersheds.

A set of downstream regime equations was presented for the purpose of indirectly estimating streamflow characteristics. For use with the regime equations, empirically determined coefficients were developed for sixteen different types of channel materials. When combined with a set of universal exponents, the coefficients provide for the use of a set of equations which define the width, depth, velocity, and slope of a natural channel under bankfull flow conditions. The general form of the equations follows that previously suggested by Leopold and Maddock (1953) in a paper on hydraulic geometry. (See also W75-04213) (Humphreys-ISWS)

SURFACE WATER DATA OF THE UPPER MICHIGAN REGION PROJECT SANGUINE, SITE STUDY.
EDAW, Inc., San Francisco, Calif.
Available from the National Technical Information Service, Springfield, Va. 22161, as AD-780 290, $4.25 paper copy, $2.25 microfiche. February 1974. 44 p, 2 fig, 2 tab, 20 ref, 3 append. Contract N62472-73-C-1056.

Descriptors: *Surface water availability, *Surface drainage, *Surface runoff, Streams, Rivers, Drainage, Permeability, Storage, Quality control, Glacial drift, Bacteria, Silts, Scour, *Lake Michigan, *Lake Superior, *On-site data collections, *Michigan, Water quality, Surface waters.

The study area is drained by many streams that converge into large streams and rivers flowing out of the area. These major drainages flow in two general directions. Large streams draining the northern and western portions generally flow north to Lake Superior. Streams draining the central and southeastern portions drain southeastward into Lake Michigan, or into the Menominee River (which also drains into Lake Michigan). The drainage is poorly developed in most of the area and it is characterized by numerous ponds, lakes, and swampy areas. There are often thick and extensive deposits of permeable glacial overburden, and during rain periods, much of the rain infiltrates the ground instead of running off. The presence of significant numbers of surface water bodies allows temporary storage of surface runoff. These factors combine to produce a streamflow behavior characterized by relatively gradual rises in streams, moderate peak flows, and then gradual declines in streamflow. The quality of water in the streams is generally good. The Precambrian bedrock yields little soluble material to the streams. The overlying glacial deposits in this area yield only small amounts of soluble materials. There is some bacterial contamination of streams and lakes in highly populated parts of the area. Silt loads in the streams are generally low, although stream turbidities can be high in local areas downstream of mining operations. There are potential scour problems in areas where there are appreciable thicknesses of unconsolidated glacial deposit materials. Surface water resources are not extensively developed. The main uses of streams and lakes are for recreation, fishing, and dilution of wastes. (Dawes-ISWS)

A METHOD FOR MAINTAINING CROSS AND SERIAL CORRELATIONS AND THE COEFFICIENT OF SKEWNESS UNDER GENERATION IN A LINEAR BIVARIATE REGRESSION MODEL,
Tahal Consulting Engineers Ltd., Tel Aviv (Israel). Dept. of Research, Development and Planning.
J. P. Kahan.
Water Resources Research, Vol 10, No 6, p 1245-1248, December 1974. 8 ref, append.

Descriptors: *Synthetic hydrology, *River flow, *Statistical analysis, Time series analysis, Stochastic processes, *Regression analysis, Hydrologic data, Model studies, Analytical techniques, Correlation analysis, Monthly.
Identifiers: *Bivariate regression model, Serial correlations, Gamma random variables.

A methodology was presented for generating a series of monthly flows at a gaging station when monthly flows at another gaging station can be generated and the historic monthly flows at the two gaging stations were correlated. The mean, standard deviation, and coefficient of skewness of the generated values were chosen to conform with known data. A stepwise process was postulated whereby, unlike the usual multiple-regression technique, an extra variable was added to the otherwise complete model. By using this technique to coefficient of skewness of the flows can be maintained, a result that circumvents any attempt to calculate the joint moment generating function of gamma random variables, which proved to be the stumbling block of prior analyses. (Singh-ISWS)
W75-04309

CRE: A METHOD FOR SOLVING PROBABILITY PROBLEMS RELATED TO HYDROLOGIC TIME SERIES,
Idrotecneco, San Lorenzo in Campo, (Italy).
L. Torelli.
Water Resources Research, Vol 10, No 6, p 1113-1122, December 1974. 9 fig, 4 ref.

Descriptors: *Time series analysis, *Distribution patterns, *Statistical analysis, *Algorithms, *Numerical analysis, Stochastic processes, Methodology, Simulation analysis, Computers, Streamflow, Hydrology.
Identifiers: *Discrete distribution, Periodically correlated processes, Discretization.

When the probability structure of a time series is known, a number of probability problems related to the series remain to be answered. A new method (CRE, event realization counter) for solving such problems was proposed. It consists of approximating the original series with continuous distribution by a suitable series with discrete distribution. Exact solutions of the problems in consideration can be derived. The validity of the approximation was checked, the algorithms used were described, and a few applications of the method were shown. (Singh-ISWS)

GEOLOGY AND GROUND-WATER RESOURCES OF GORDON, WHITFIELD, AND MURRAY COUNTIES, GEORGIA,
Geological Survey, Atlanta, Ga.
C. W. Cressler.
Georgia Geological Survey Earth and Water Division Information Circular 47, 1974. 56 p, 11 fig, 3 plate, 7 tab, 20 ref.

Descriptors: *Groundwater, *Water resources, *Georgia, *Hydrogeology, Stratigraphy, Basic data collections, Hydrologic data, Springs, Water wells, Water quality, Water yield.
Identifiers: Gordon County(Ga), Whitfield County(Ga), Murray County(Ga).

Groundwater resources were studied in Gordon, Whitfield, and Murray Counties, Georgia, which lie mainly in the Valley and Ridge physiographic province. Rocks range from Early Cambrian to Mississippian in age. The east edge of the tri-county area extends into the Blue Ridge and Piedmont Provinces and is underlain by metasedimentary and igneous rocks of Precambrian and possible Cambrian age. An inventory of 850 wells revealed that moderately mineralized water in quantities of 3 to 20 gpm suitable for domestic and farm supply can be obtained at depths less than 300 feet nearly everywhere in the three counties, except on steep slopes and narrow ridges. Larger yield industrial or municipal wells have been developed only in small areas underlain by carbonate rocks. Only 16 wells supply more than 50 gpm. The largest yield obtained is 300 gpm for limestone at the top of the Conasauga Formation. In adjacent counties, yields of 300 to 1,000 gpm are produced by wells less than 350 feet deep along the larger intermittent streams that drain the Knox Group. Broad exposures of the Knox in the report area contain many sites that should supply more than 300 gpm. Large supplies of groundwater are available from springs. Twenty-six springs in the area have minimum recorded flows of 200 gpm. Most of the spring water is moderately hard to hard, has a low iron content and can be used with little or no treatment. GEOHYDROLOGY OF NEMAHA COUNTY, NORTHEASTERN KANSAS,
Geological Survey, Lawrence, Kans.
J. R. Ward.
Ground-Water Series No 2, November 1974. 19 p, 10 fig, 3 plate, 2 tab, 15 ref.

Descriptors: *Hydrogeology, *Water resources, *Kansas, Groundwater, Water supply, Water yield, Water wells, Hydrologic data, Alluvium, Sandstones.
Identifiers: *Nemaha County(Kans).

Rocks of Late Pennsylvanian and Early Permian age underlie Nemaha County, Kansas, and are exposed along stream valleys. Glacial deposits of Pleistocene age underlie most of the county and range in thickness from a few feet to 380 feet. A deep valley that is buried by early Pleistocene deposits extends from west to east across the county. Alluvial deposits beneath the terraces and along the present stream valleys are of Illinoisan to Recent age. Wells completed in bedrock formations commonly yield 50 gpm or less. Yields to wells in the glacial deposits that fill the deep buried valley may be as much as 200 gpm. Elsewhere in the country, the glacial deposits generally yield only enough water for relatively small domestic and stock supplies. Wells in alluvial deposits commonly yield 5 to 25 gpm, but yields of as much as 150 gpm are obtained locally. Water in formations of Pennsylvanian age, in most of the glacial deposits, and in the alluvial deposits is classified as a calcium-bicarbonate type. Water in the Permian rocks and in the deeply buried glacial deposits commonly is a calcium-sulfate type. Locally, concentrations of sulfate and nitrate are as much as 2,100 and 490 milligrams per liter, respectively. (Knapp-USGS)
W75-03986

GEOLOGY AND GROUND-WATER RESOURCES OF MONTGOMERY COUNTY, SOUTHEASTERN KANSAS,
Geological Survey, Lawrence, Kans.
H. G. O'Connor.
Ground-Water Series No 1, September 1974. 12 p, 5 fig, 1 plate, 2 tab, 9 ref.

Descriptors: *Hydrogeology, *Water resources, *Kansas, Groundwater, Water supply, Water yield, Water wells, Hydrologic data, Alluvium, Sandstones.
Identifiers: *Montgomery County(Kans).

In Montgomery County, Kansas, sandstone beds in the Stranger Formation, Stanton Limestone, and Chanute Shale are the most important consolidated-rock aquifers. Locally, wells in the Stranger may yield as much as 20 gallons per minute. Wells in the Chanute may yield as much as 50 gpm. Suitable water for domestic and stock use is obtained from sandstone at depths of 200 to 400 feet. In some parts of the county, groundwater may be moderately saline at depths of 50 feet or less. Fluvial deposits of Quaternary age underlie the stream valleys, and are an important source of groundwater. These deposits yield as much as 100 gpm. The water generally is very hard, but is suitable for domestic and stock use except in local areas where excessive concentrations of sulfate, sodium, and chloride are present. Aquifers in many local areas have been contaminated by brine associated with oil and gas production. The major use of groundwater is for domestic and stock supplies. All of the cities use treated surface water, and water districts obtain surface water to serve much of the rural population. (Knapp-USGS)

HYDROGEOLOGY OF THE CAREFREE RANCH AREA, MARICOPA COUNTY, ARIZONA,
Arizona Univ., Tucson. Dept. of Geosciences
J. A. Boyer.
The University of Arizona, Department of Geosciences, 1974 Master's thesis. 75 p, 6 tab, 2 append, 23 fig, 2 map, 24 ref.

Descriptors: *Hydrogeology, *Aquifers, *Groundwater, *Groundwater potential, *Water storage, Groundwater movement, Precambrian era, Tertiary period, Quaternary period, Metamorphic rocks, Alluvium, Permeability, Transmissivity, Gravity studies, Pumping, Geophysics, Structural geology.

The purpose of this study was to define the groundwater availability of the Carefree Ranch area using hydrogeologic methods. The three rock units that crop out in the area are: Precambrian metamorphic rock and granite, Tertiary extrusive volcanic rock, and Quaternary to recent alluvium. The Precambrian rocks are essentially impervious. The Tertiary volcanic rocks are a potential water source, but have not yet been drilled to determine their capacity. The valley-fill alluvium, which is considered to be the best potential aquifer in the ranch area produces 50 to 225 gpm. Gravity data indicate that the basin containing the valley-fill alluvium is 7000 feet deep, and using a minimum storage coefficient of 0.07, is estimated to contain a maximum figure of 45,000 acre feet of available water. A more detailed study will be required to determine exact locations for future well sites. (Mastic-Arizona)

Identifiers: *Convection-diffusion equation, Transport models, Hanford groundwater system.

The measurement of dispersion and sorption coefficients to the degree of detail required by a calculated transmissivity (or permeability) for the unconfined aquifer beneath the Hanford Reservation would be extremely expensive and time-consuming, if not impossible. As an alternative, methodologies were developed for estimating dispersion and sorption coefficients from correlations with characteristic soil properties. Preliminary correlations were proposed and contour maps of dispersion and sorption coefficients for the Hanford aquifer as determined from these correlations were presented. (Prickett-ISWS)

Identifiers: Parabolic partial differentials, Newton method, Gauss-Newton method.

The determination of the unknown functions governing aquifer behavior, especially the transmissibility function, was studied. The behavior of the aquifer was considered to be governed by a two-dimensional linear parabolic differential equation. The inverse or identification problem was to determine the unknown functions in the above differential equation by observations on the aquifer potentials. The identification of the unknown transmissibility function was formulated in a variational framework and consisted of minimizing a certain error functional. The above problem was not well posed without restrictions on the function spaces. The transmissibility function was restricted to a certain class and was approximated by combination of piecewise bilinear functions. The degree of detail of the approximation was made to depend on the available data. Numerical procedures were provided for the solution of the partial differential equation and the above minimization problem. The procedure outlined was used on examples and the results were presented to demonstrate the feasibility and usefulness of the approach. (Terstriep-ISWS)

SECOND-ORDER THEORY OF FLOW IN THREE-DIMENSIONAL DEFORMING MEDIA,
Centro di Ricerca IBM di Venezia (Italy).
G. Gambolati.
Water Resources Research, Vol 10, No 6, p 1217-1228, December 1974. 15 fig, 44 ref, 1 append.

Descriptors: *Groundwater movement, *Land subsidence, *Compaction, *Mathematical studies, *Unsteady flow, *Aquifers, Equations, Numerical studies, Artesian aquifers, Groundwater mining, Pore water, Overdraft, Sediments, Subsidence, Pore pressure.
Identifiers: *Three-dimensional flow, Horizontal soil displacement, Noordbergum effect.

A basic assumption in groundwater flow theory is that consolidation occurs in the vertical direction only. In real three-dimensional media this condition is not satisfied a priori. A second-order theory of flow was developed including the consideration of horizontal soil displacements. The 'strain nucleus' or 'tension center' approach, well-known in thermoelasticity was used. The formulation of the theory showed that volume strain in a point P of the system could be viewed as being distinctly contributed by pore pressure variations in and outside P. The latter contribution, which vanishes identically in one-dimensional media, was called the 'three-dimensional effect.' Solutions applied to a semi-infinite mechanically homogeneous medium showed that the three-dimensional effect was negligible and the diffusion equation was good as long as the ratio W between the average depth and the thickness of aquifer is greater than or equal to Z, whatever its areal exent. If W is less than 2 (shallow and thick aquifers), the above effect produces an additional compression of soil during an intermediate stage after pumping began and hence a slowing down of the rate of pressure head decline, as has been predicted by standard solutions. The most critical conditions occur for W = 1/2, i.e., in unconfined aquifers. The present theory allowed for a short qualitative analysis of the 'Noordbergum effect' or reverse water level fluctuations. (Prickett-ISWS)

THE SHAPE OF THE INTERFACE IN STEADY FLOW IN A STRATIFIED AQUIFER,
Technion - Israel Inst. of Tech., Haifa (Israel). Dept. of Civil Engineering.
Y. Mualem, and J. Bear.
Water Resources Research, Vol 10, No 6, p 1207-1215, December 1974. 12 fig, 1 tab, 8 ref.

Descriptors: *Groundwater movement, *Saline water-freshwater interfaces, *Stratification, *Steady flow, Equations, Model studies, Coasts, *Aquifers, *Saline water intrusion, Water pollution sources, Encroachment, Sea water, Seepage, Mathematical studies, Dupuit-Forchheimer theory, Artificial recharge, Confined water, Analytical techniques.
Identifiers: *Hele-Shaw models, Israel, Semipervious layers, *Coastal aquifers.

The shape of the interface in a coastal aquifer in which a thin horizontal semipervious layer is present was studied. Field obsrevations and laboratory experiments showed that under these conditions a discontinuity in the shape of the interface occurs such that a freshwater region exists under the semipervious layer while immediately above it, saline (or mixed) water is present in the aquifer. An approximate solution was presented for the shape of the interface below the semipervious layer and for the extent of the freshwater region above it under steady state conditions. The solution was based on the Dupuit assumption and on a linearization of part of the flow equations. Laboratory experiments on a Hele-Shaw model showed a good agreement between the forecasted interface profiles and those actually observed in the model. From the results of the experiments it follows that the separation of the interface into two parts, below and above the semipervious layer, decreases as the length of landward seawater intrusion increases. The proposed solution can readily be applied to the case of a phreatic surface under an artificial recharge basin when the aquifer is separated into subaquifers by a sequence of semipervious layers. RISE AND DECLINE OF THE WATER TABLE INDUCED BY VERTICAL RECHARGE,
California Univ., Davis.
M. A. Marino.
Journal of Hydrology, Vol 23, No 3/4, p 289-298, 1974. 1 fig, 9 ref.

Descriptors: *Water table, *Recharge, *Drains, *Deep percolation, Dupuit-Forchheimer theory, *Groundwater movement, Saturated flow, Hydraulic properties, Mathematical models, Water table aquifers, Analytical techniques, *Aquifers.
Identifiers: Boundary-valve problems.

Analytical expressions were presented for the water-table rise and decline in an unconfined aquifer bounded by two streams or drains and receiving vertical recharge. In addition, expressions for the maximum height of the water table were included. The water levels in the drains were considered to be at equal elevation. Two types of recharge were treated: time-varying and uniform. The solutions were expressed in terms of the head averaged over the depth of saturation. A judicious choice of the weighted mean of the depth of saturation was necessary in all applications of the solutions presented. For instance, the water-table profiles were calculated by the method of successive approximations. The weighted mean of the depth of saturation during a period of flow was taken as a first approximation equal to the initial depth of saturation. The first approximation of the height of the water table was then calculated. In the second trial the weighted mean depth was approximated by the average of the initial depth of saturation and the first approximation of the height of the water table. The procedure was repeated until the value of the calculated height of the water table converged. (Visocky-ISWS)
W75-04333

MODELS OF DISPERSION IN A GRANULAR MEDIUM,
California Univ., Davis.
M. A. Marino.
Journal of Hydrology, Vol 23, No 3/4, p 313-318, 1974. 10 ref, 1 append.

Descriptors: *Dispersion, *Porous media, *Adsorption, Mass transfer. Dissolved solids, Velocity, Convection, Analytical techniques, Solutes, *Groundwater movement, *Mathematical models, Seepage, Model studies, Path of pollutants.

Mathematical models were developed for dispersion problems within a saturated granular medium in a unidirectional flow field in which the concentration of the displacing fluid was considered to be a function of time. The medium was assumed to be homogeneous, isotropic, and semi-infinite in areal extent. The effect of adsorbing and non-adsorbing granular media was taken into account. The models are useful for predicting the concentration of contaminants in representative field problems. (Visocky-ISWS)

APPLICATION OF SURFACE MODERATORS TO MEASUREMENT OF WATER CONTENT IN FIELD TOPSOILS WITH A NEUTRON MOISTURE DEPTH GAUGE,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia). Div. of Plant Industry.
E. W. Pook, and T. Hall.
Field Station Record, Division of Plant Industry, CSIRO (Australia), Vol 13, No 1, p 31-42, 1974. 6 fig, 1 tab, 6 ref.

Descriptors: *Neutron meters, *Calibrations, *Soil moisture meters, *On-site tests, *Topsoils, Moisture content, Measurement, Forest soils, Soil surfaces, Plastics, Cadmium.
Identifiers: Surface moderators.

Surface moderators are considered for use with neutron moisture gauges in order to extend the application of the normal soil calibration to gauge measurements made at relatively shallow depths, and to help maintain or improve the precision of

measurements related to discrete toposil layers over a useful range of soil moisture contents. The effectiveness of a polythene surface shield along and in combination with each of two sizes of cadmium annulus as surface moderators in moderately heteorogeneous forest toposils under field conditions has been assessed. The polythene shield with a small cadmium annulus was found to be most successful in extending the range of the normal soil calibration to data obtained at 10 cm depth. Gauge estimates of water content to that depth were related with good precision to mean moisture content of the top 20 cm of soil in the range from 6% to 22% water by volume. Changes in mean moisture content of the top 20 cm layer of soil may be monitored with acceptable accuracy without surface moderators, using the normal gauge calibration. (Levick-CSIRO)

EFFECT OF SULFURIC ACID AND SULFUR DIOXIDE ON THE AGGREGATE STABILITY OF CALCAREOUS SOILS,
UArizona Univ., Tucson Dept. of Soils, Water and Engineering.
S. Miyamoto, H. L. Bohn , J. Ryan, and M. S. Yee.
Soil Science, Vol. 118, No. 5, Nov. 1974, p 299-303. 2 tab, 3 fig, 12 ref.

Descriptors: *Soil aggregates, *Soil erosion, *Soil stability, *Sulfur compounds, *Carbonates, *Atmospheric fallout, Soil temperatures, Calcareous soils, Druing, Southwest U. S., Silts.
Identifiers: Sulfuric acid, Sulfur dioxide.

Soils are being increasingly exposed to sulfuric acid (H2SO4) and sulfur dioxide (SO2), both common waste products from smelting, fossil fuel combustion, and other industrial activities. The proper use of sulfuric acid can contribute to increased productivity in calcareous and sodic-calcareous soils. The water-stable soil aggregates were measured for two sodic-calcareous and six calcareous soils treated with H2SO4 and SO2. The amount of sulfur which may cause significant reduction in aggregate stability depends on the soil basicity. Drying of the soils further destroyed the aggregates, probably by enhancing the reactions with H2SO4. The sorption of SO2 from moist streams also reduced aggregate stability, but to a lesser degree than an equivalent amount of H2SO4. It is uncertain whether the aggregate destroyed by this process contributes to increasing soil erosion. (Mastic-Arizona)

DUNE SAND STABILIZATION WITH SYNTHETIC SOIL CONDITIONERS: A LABORATORY EXPERIMENT,
Ghent Rijksuniversiteit (Belgium). Soil Physics, Soil Conditioning and Horticultural Soil Sciences Lab.
D. Gabriels, M. De Boodt, and D. Minjauw.
Soil Science, Vol. 118, No. 5, November, 1974, p 332-338. 7 tab, 3 fig, 10 ref.

Descriptors: *Dune sands, *Rainfall, *Infiltration, *Soil surface.s, *Erosion control, Raindrops, Rainfall simulators, Asphalt, Moisture content, Rainfall intensity, Runoff, Erosion.
Identifiers: *Splash erosion, Polyvinyl acetate, Polyacryl amide.

Dune sand was subjected to a range of rain intensities from which a linear relationship was found between the side splash erosion and the kinetic energy of the rainfall. This relationship was used to study the influence of different amounts of chemicals sprayed as a mulch or mixed with the top layer of sand in order to stabilize this sand under raindrop action. Polyvinyl acetate, polyacryl amide with a cross-linker, and an asphalt emulsion applied at proper rates can be used for dune sand stabilization. Further studies are needed to determine the toxicity of these treatments to plants, and to see if seeds can germinate through the soil conditioner film. (Mastic-Arizona)

MECHANISTIC RESPONSE OF EXPANSIVE CLAYS,
Indian Inst. of Tech., Madras, Soil Engineering Lab.
K. S. Sankaran, and Rao D. Venkateshwar.
Soil Science, Vol 118, No. 5, Nov, 1974. p 289-298, 2 tab, 1 fig, 42 ref.

Descriptors: *Clay minerals, *Clays, *Compressibility, Montmorillonite, Model studies.
Identifiers: *Clay-water system, Swelling.

A microscopic model of expansive clay-water systems was developed based upon a critical examination of the literature. A mechanistic response of expansive clays is also presented. Clays may be in the form of clay platelets, clay crystals, clay aggregates, clay congolmerates, or any combination of these depending upon environmental conditions and the purity and type of the clay mineral. The compressibility characteristics of the clay and water system have been grouped into three pressure ranges: initial, intermediate, and final stage of compression. An analysis of existing data on compression and rebound characteristics was made for sodium and calcium montmorillonitic clays. The analysis conformed to the microscopic model of clay and the postulation with regard to the mechanistic response of expansive clays under pressure. (Mastic-Arizona)

THE EFFECT OF GYPSUM TREATMENT ON THE SWELLING OF NATURAL CLODS OF A CLAY SOIL,
Commonwealth Scientific and Industrial Research Organization, Deniliquin (Australia). Div. of Plant Industry.
B. J. Bridge, and J. Tunny.
Soil Science, Vol 115, No 6, June 1973. p 414-419, 4 fig, 1 tab, 18 ref.

Descriptors: *Clays, *Porosity, *Soil moisture, *Wetting, *Soil treatment, Gypsum, Sodium, Calcium, Infiltration, Bulk density, Moisture content, Soil horizons, Submergence, Soil texture, Impervious soils.
Identifiers: Distilled water.

Three treatments were applied to clods of clay soil to reduce swelling and improve water entry. The treatments were: first, wetting with distilled water; second, wetting with saturated gypsum solution; and third, wetting with distilled water following gypsum treatment. The gypsum treatment limited the amount of swelling in the clods as a result of replacement of sodium ions with calcium ions on the clay exchange sites. The gypsum treatment also improved the air-filled pore space in clods from the B horizon with a 59 percent clay content. Investigations of the pore-space relations and swelling properties in A and B horizons of the clay soil clods were made using a saran resin coating technique. (Mastic-Arizona)

A FLOTATION METHOD FOR THE RAPID MEASUREMENT OF THE WET BULK DENSITY OF SOIL CLODS,
National Inst. of Agricultural Engineering, Penicuik (Scotland).
D. J. Campbell.
J Soil Sci, Vol 24, No 2, p 239-243, 1973.
Identifiers: *Clods(Soil), Coating, *Flotation method, Immersion, Measurement, Resin, Soil, Wet bulk density, *Soil density

The clods are sprayed with a waterproof coating of a resin and then immersed sequentially in liquids of different specific gravity. It is compared with the wax coating method for a selection of soil textures and moisture contents and shown to be 10 times as rapid when used to measure wet bulk density with an accuracy of plus or minus 0.05 g/cm cu. The flotation method was used to show that, for 3 contrasting soils, clod wet bulk density is independent of clod size.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF IRRIGATION WATER QUALITY ON EXCHANGEABLE SODIUM PERCENTAGE IN A SODIC SOIL,
Uttar Pradesh Agricultural Univ., Pantnagar (India).
B. S. Rawat, and T. A. Singh.
Annals of Arid Zone, Vol 13, No 1, March, 1974. p 39-46, 1 fig, 3 tab, 10 ref.

Descriptors: *Irrigation water, *Water quality, *Percolation, *Soil water, *Soil chemical properties, Sodium, Calcium, Magnesium, Leaching, Electrolytes, Permeability, Soils, Salts, Conductivity.
Identifiers: SAR(Sodium absorption ratio), ESP(Exchangeable sodium percentage).

Studies using different quality irrigation waters showed that more efficient leaching was accomplished with waters of high electrolyte concentrations and low sodium absorption ratio (SAR) values. Greater amounts of water with high SAR are required to remove a given amount of salt than water with a low SAR. In order to reclaim a sodic soil having a high exchangeable sodium percentage (ESP), leaching should be carried out with waters of high electrolytic concentrations and low SAR values. Such waters will improve permeability as well as facilitate leaching. ESP values will be lower in the upper layers compared to the lower layers of the soil because of the smaller amounts of calcium and magnesium that remain in the percolating solution to effect sodium exchange in the lower layers. (Mastic-Arizona)

COMPARISON OF SOME METHODS FOR DETERMINING ORGANIC PHOSPHORUS IN SOME NIGERIAN SOILS,
Institute for Agricultural Research, Zaria (Nigeria).
V. B. Ipinmidun.
Soil Science, Vol 115, No 4, April 1973. p 324-325, 1 tab, 7 ref.

Descriptors: *Phosphorus compounds, *Organic compounds, *Soil types, *Hydrolysis, *Soil texture, Solubility, Hydrogen ion concentration.
Identifiers: *Nigeria.

The purpose of this study was to find the method that would give the best approximation of the organic phosphorus in a variety of soils and also lend itself to rapid routine determination. Samples were analyzed using the ignition methods of Sauders and Williams (J. Soil Science 6:254-267, 1955), and of Legg and Black (Soil Sci. Soc. Am. Proc 19:139-143, 1965); and extraction methods of Mehta, Legg, Goring, and Black (Soil Sci Soc. Am. Proc. 18:443-449, 1955), and Harrap (J. Soil Sci 14:82-87, 1963). Results showed agreement between the Mehta et al and Harrap extraction methods and the Legg and Black ignition method. Therefore the convenience and speed, along with the accuracy of organic phosphorus determination, commend the Legg and Black ignition method for use in routine analysis on soils similar to the ones used in the study. DISTRIBUTION OF BORON IN SALT AFFECTED AND CONTIGUOUS NORMAL SOILS,
Central Soil Salinity Research Inst., Karnal (India).
G. P. Bhargava, S. K. Singhla, and I. C. Gupta.
Annals of Arid Zone, Vol 13, No 1, March 1974. p 32-38, 4 tab, 14 ref.

Descriptors: *Saline soils, *Sodium, *Boron, *Saline water, Chlorides, Carbonates, Bicarbonates, Hydrogen ion concentration, *Leaching, Soil profiles, Soil properties, Electrical conductance, Toxicity.

An attempt was made in this study to correlate boron in saturated soil extracts to various soil characteristics including ESP (exchangeable sodium percentage), soluble sodium carbonate, and chloride ions. A number of soil profiles were sampled having a wide variety of different soil characteristics. In the saline-sodic type soils, boron was found to be positively correlated with pH, ECe (electrical conductivity), ESP, sodium, carbonate, chloride and bicarbonate ions, but no such correlation was discovered in normal and chloride type soils. The reason for the poor correlation between boron and the various soil characteristics in the chloride and normal type soils was not clear. More efficient leaching and small amounts of exchangeable sodium in these soils were considered as possible reasons. (Mastic-Arizona)

EVALUATION OF EDDHA AS AN EXTRACTION AND ANALYTICAL REAGENT FOR ASSESSING THE IRON STATUS OF SOILS,
Nevada Agricultural Experiment Station, Reno.
G. V. Johnson, and R. A. Young.
Soil Science, Vol 115, No 1, January 1973. p 11-17, 1 fig, 5 tab, 21 ref.

Descriptors: *Iron, *Calcareous soils, *Acidic soils, *Spectrophotometry, Organic matter, Analytica techniques, Hydrogen ion concentration, Photosynthesis.
Identifiers: EDDHA(Ethylene di(O-hydroxyphenylacetic acid)), Iron chlorosis.

Crops growing on calcareous soils as well as many acid soils are subject to iron chlorosis. The effectiveness of EDDHA (ethylene di(O-hydroxyphenylacetic acid)) as an extraction and analytical reagent for assessing the iron status of soils was studied. Results of the study show EDDHA has potential as an extracting iron that is related to the metabolically active iron in the plant. Direct spectrophotometric analysis of EDDHA extracts yielded high results because of light absorption by soil organic matter. Procedures are outlined which can eliminate this error, which is considered minor because it was relatively constant for all soils analyzed. The methods using EDDHA offer an economic advantage over other methods and could be adapted for routine laboratory use. (Mastic-Arizona)

USE OF A MICROWAVE REMOTE SENSOR FOR DETERMINATION OF WATER IN SUBSOILS,
Missouri Univ., Rolla. Dept. of Electrical Engineering.
B. K. Park, J. E. Adair, and C. McDowell.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 255, $3.75 in paper copy, $2.25 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, August 1974. 40 p, 8 fig, 5 tab, 2 ref. OWRT A-070-MO(1). 14-31-0001-4025.

Descriptors: Soils, *Remote sensing, *Soil moisture, Measurement, Analytical techniques, Soil properties, Soil analysis, *Subsoil, Microwaves.
Identifiers: *Microwave remote sensing devices.

Laboratory equipment using a microwave remote sensor was developed for measuring the amount of moisture in different soil materials. A technique based on the measurement of the microwave transmission properties of samples located within a waveguide was used and the frequency used was 10.525 GHz. Input impedance was measured by slotted line techniques. Calculations of the complex dielectric constant were made for each measured value of the complex propagation constant to provide a comparison with measured values of various soils. Evaluations were made for the use of passive and active microwave remote sensing devices for water content of soils under different conditions. Additional studies are needed to determine accuracy for measuring moisture in subsoils.

LYSIMETRIC AND CHEMICAL INVESTIGATIONS OF PEDOLOGICAL CHANGES: I. LYSIMETERS AND THEIR DRAINAGE WATERS,
Missouri Univ., Columbia.
W. J. Upchurch, M. Y. Chowdhury, and C. E. Marshall.
Soil Sci. Vol 116, No 4, p 266-281. 1973, Illus.
Identifiers: *Beidellite, Cations, Chemicals, Drainage, *Lysimeters, Minerals, *Pedological changes, *Soil profiles, X-ray diffraction, Clays, Loam.

Twenty-four filled-type lysimeters with associated plots on the Mexico silt loam soil were studied over the period April 1963-Nov. 1969. Additions of 5 cations as carbonatesor bicarbonates, Ca, Mg, Na, K, and NH4, were made at 2 depths, 4-12 in. and 16-24 in., in cropped and uncropped series. The drainage waters from the lysimeters were collected, measured and analyzed for Ca, Mg, Na, K, Si, Al and Cl. In the fallow series, 2.67-15.29% of the rainfall appeared as drainage; the grass series gave 0-4.48% (mean annual rainfall was 38 in., well distributed). Chloride added initially in the top of 4 in. of the soil was recovered in 1- over 5 yr, the lysimeter showing the greatest throughput of water giving the most rapid loss. The soil profile was characterized by determinations of exchangeable cations and exchange capacity at different depths, and by X-ray diffraction on 2 fractions of the clay, 2 micro-0.2 micro and less than 0.2 micro. The dominant clay mineral is beidellite. A mixed layer of mica-beidellite is also present. Kaolinite occurs in very small amounts, especially in the fine fractions. The 0.7 in. surface layer contains less well-defined beidellite than the lower horizons. Cationic ratios such as Na/K and Mg/Ca showed significant variations with depth. The data for Mg, Na, K, pH and SiO2 from successive lysimeter samples were plotted on Garrels and Christ diagrams. For Mg the points lie close to the beidellite-kaolinite boundary, Na and K are in the

kaolinite area. Comparison with results for equilibrated soil samples from the 28-32-in. layer showed poor agreement. The gravel layer in the lysimeter had cation exchange properties different from those of the lowest layer of soil. It was therefore insufficiently inert.--Copyright 1974, Biological Abstracts, Inc.

EVALUATION OF CRITERIA FOR SEPARATING SOILS WITH XERIC AND UDIC MOISTURE REGIMES,
Bureau of Land Management, Portland, Oreg.
B. R. Thomas, G. H. Simonson, and L. Boersma.
Soil Sci Soc Am Proc. Vol 37, No 5, p 738-741. 1973, Illus.
Identifiers: Cambial, Criteria, *Moisture depletion, Soil classification, Pseudotsuga-Menziesii, Soils, *Udic moisture regime, *Xeric moisture regime, *Soil moisture, *Soil water suction, *Oregon, Soil-water-plant relationships.

Criteria for classifying soil series in the Coast Range Mountains of western Oregon into categories with xeric and udic moisture regimes were evaluated. Relationships among soil-water suction, plant-water suction, and cambial activity of Douglas-fir (Pseudotsuga menziesii (Mirb.) Franco) were also evaluated. Soil-water content was measured with gypsum blocks. Plant-water suction of Douglas-fir branch tips was measured with a pressure bomb. These measurements were taken early in the morning at least once every 10 days. Experimentals sites were selected on 3 soil series and 1 north slope soil phase tentatively classified as xeric and on 4 soil series tentatively classified as udic. The 4 study sites in the xeric zone had soil-water suctions equal to or greater than 15 bars within the soil-water control section for at least 60 consecutive days. None of the 4 study sites in the udic zone were dry that long. Cumulative water deficit in the xeric zone was about 75% of the seasonal total when the entire soil-water control section attained 15 bars. Almost all available water was removed from the upper third of the profile in the xeric zone when the trees stopped producing springwood. Much less water was removed from the upper third of the profile in the udic zone. The same relationship held true for the available water in the entire profile at time of dormancy. Trees in the xeric zone produced springwood of 23 more days and have 26 more days total growing time than trees in the udic zone. Changes of soil and plant-water suction with time showed similar patterns but different magnitudes. Plant-water suction cannot be used in lieu of soil-water suction for purposes of soil classification.--Copyright 1974, Biological Abstracts, Inc.

TEMPERATURE REGIMES AND CLASSIFICATION OF SOME WELL-DRAINED ALPINE SOILS IN ALASKA,
Soil Conservation Service, Palmer, Alaska.
S. Rieger.
Soil Sci Soc Am Proc. Vol 37, No 5, p 806-807. 1973.
Identifiers: *Alaska, *Alpine soils, Pergelic temperature regime, *Soil terperature, *Soil classification, Soil drainage.

Temperatures at a depth of 50 cm were taken in 4 well-drained alpine soils of interior and south-central Alaska (USA) over a 3 yr period. The soils of the interior, under a strongly continental climate, have a pergelic temperature regime, but those of coastal mountain under a cool maritime climate do not.--Copyright 1974, Biological Abstracts, Inc.

LOESS DISTRIBUTION ON A WISCONSIN-AGE TILL PLAIN IN SOUTHWESTERN OHIO,
Landmark, Inc., Columbus, Ohio.
A. G. Hock, L. P. Wilding, and G. F. Hall.
Soil Sci Soc Am Proc. Vol 37, No 5, p 732-738. 1973, Illus.
Identifiers: *Carbonates, *Loess distribution, *Ohio, *Soil types, Till plains, Topography, Variability, Surface elevation, Soil classification.

Loess thickness, depth to carbonates, nature of loess-till contact, soil type and surface elevation were observed at 15 m (or alternatively 30 m) intervals along 8.5 km of pipeline trench wall; similar observations were made at 4.6 m intervals in 3 41 m x 41 m grid sites each containing 100 observation points. Over 800 observations were made. Data were statistically summarized according to soil drainage classes (landscape position) and glacio-physiographic regions. Loess blankets the landscape, but is usually thickest on poorly-drained landscape positions and, except for local pockets, thins or becomes absent on slopes more than 5%. Local distribution of loess is highly variable over horizontal distances of 7.5 m or less and is directly related to the irregular microtopography of the underlying till surface. Construction of a loess isopachous map for this area was deemed impractical because of the large number of observations that would be required to estimate mean loess thickness classes within relatively narrow limits (plus or minus 20%), even on relatively stable geomorphic areas. No source area(s) could be identified for these loess deposits based on loess thickness or particle-size parameters.--Copyright 1974, Biological Abstracts, Inc.

LYSIMETER INSTALLATIONS IN SANDSTONE AT STYRRUP, NOTTINGHAMSHIRE,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
R. Kitching, and L. R. Bridge.
Journal of Hydrology, Vol 23, No 3/4, p 219-232, 1974. 7 fig, 2 tab, 2 ref.

Descriptors: *Lysimeters, *Sandstones, Neutron activation analysis, Groundwater, Infiltration, Permeability, Observation wells, Boreholes, Membranes, Instrumentation, Measurement, Pumping.
Identifiers: *Neutron probes, *Bunter Sandstone(UK).

The construction and operation were described of two relatively large lysimeters installed to measure the infiltration from rainfall on undisturbed blocks (100 sq m) of Bunter Sandstone in north Nottinghamshire, England. The lysimeters were surrounded by impermeable membranes installed in trenches to minimize disturbance of the adjacent strata and grouted into the impermeable marl below the base of the sandstone. A dewatering borehole in each lysimeter kept the water levels inside and outside equal. During 1972 pumping tests were carried out on each lysimeter to determine the rate of leakage under known head conditions Leakage varied from 0.00417 to 0.00554 cm water/day/cm head. Moisture contents inside and outside the lysimeters were measured with neutron probes. (Roberts-ISWS)

A GAMMA TRANSMISSION METHOD FOR THE DETERMINATION OF MOISTURE CONTENT IN SOILS,
Uttar Pradesh Irrigation Dept., Locknow (India).
R. S. Saksena, S. Chandra, and B. P. Singh.
Journal of Hydrology, Vol 23, No 3/4, p 341-352, 1974. 10 fig, 2 tab, 4 ref.

Descriptors: *Nuclear moisture meters, *Gamma rays, *Soils, *Clays, *Moisture content, Moisture, Soil moisture, *Soil moisture meters, Instrumentation, Soil density, Aquifers, Radiation, Stratification, Attenuation, Nuclear physics.
Identifiers: *Gamma transmission method, Nonsaturated soils.

Soil samples from strata down to 164 m were studied with respect to the linear attenuation coefficient (mu) and the mass absorption coefficient (mu/rho) for gamma rays and their variation with moisture content. Details were given for three samples examined. The variation of gamma counting rate with moisture for different thicknesses of strata was also given. The reaction of clay samples was determined by the gamma transmission method and the explanation of such reaction was given. It was suggested that stratification can also be determined by this method with the aid of the gamma-ray linear attenuation coefficient, which would also provide a method for the determination of the density of the soils in the various strata. The method was also suggested for the study of seasonal variation of moisture content. (Prickett-ISWS)

2H. Lakes

LAKES OF OREGON: VOLUME 2. BENTON, LINCOLN, AND POLK COUNTIES,
Geological Survey, Portland, Oreg.
M. V. Shulters.
Open-file report, 1974. 71 p, 5 fig, 1 tab.

Descriptors: *Lakes, *Oregon, *Data collections, Limnology, Basic data collections, Water quality, Lake morphology
Identifiers: Benton County(Oreg), Lincoln County(Oreg), Polk County(Oreg).

An inventory of lakes and reservoirs of Benton, Lincoln, and Polk Counties, Oregon, is presented. Information is provided for use by city, county, and State planning groups as well as for sportsmen, tourists, and others interested in preserving the recreational value of Oregon's lakes. In addition to office compilation of existing data, most lakes were also visited. Visits were made in late summer or early fall when lakes were most accessible and when water temperature and biological activity are at a maximum. (See also W74-06270) (Knapp-USGS)

LIMNOLOGICAL DATA FROM SELECTED LAKES IN THE SAN FRANCISCO BAY REGION, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
L. J. Britton, R. F. Ferreira, and R. C. Averett.
Open-file report, June 25, 1974. 79 p, 34 fig, 21 tab, 28 ref.

Descriptors: *Limnology, *Basic data collections, *Lakes, *California, Hydrologic data, Water quality, Thermal stratification, Reservoirs.
Identifiers: *San Francisco Bay area(Calif).

Limnological data were compiled on 21 lakes in the San Francisco Bay area of California. The history of each lake and of its regulating agency is presented, along with methods used for data collection and analyses. The largest reservoir, Lake Berryessa, has a volume of 1,600,000 acre-ft, with a discharge area of 576 sq mi. Pilarcitos Lake is one of the smallest reservoirs, with a volume of 3,100 acre-ft and a drainage area of 3.80 sq mi. Eleven of the 21 reservoirs are open to the public for recreation. The most intensive shoreline development and use is at Lake Berryessa and Lake Merced. All but three of the 21 reservoirs were thermally stratified during the summer. Eight of the reservoirs showed evidence of dissolved-oxygen depletion during the summer. Lafayette Reservoir and Loch Lomond are mechanically aerated in order to increase the dissolved-oxygen concentration and lower the surface-water temperature. The lake waters ranged from hard (320 mg/liter) in Calero Reservoir, to soft (27 mg/liter) in Upper Crystal Springs Reservoir. Drainage from abandoned mercury mines in Santa Clara County has resulted in mercury concentrations in Calero and Lexington Reservoir fish. (Knapp-USGS)

FLOOD-HAZARD STUDY--100-YEAR FLOOD STAGE FOR BALDWIN LAKE, SAN BERNARDINO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
J. J. French, and M. W. Busby.
Water-Resources Investigations 26-74, November 1974. 18 p, 4 fig, 6 tab, 8 ref, append.

Descriptors: *Floods, *Lakes, *California, Water level fluctuations, Frequency analysis, Statistics.
Identifiers: *Baldwin Lake(Calif).

Flood hazards were studied by analysis of shoreline features that represent former high-water stages on Baldwin Lake, California. These features are found at 10 different altitudes that range from 6,700 to 6,713 feet. Stage frequencies were assigned to the stages, but the date of formation of the features could be determined only for the most recent shorelines. Stage-frequency analysis involving 39 years of observed annual maximum stage record of the lake and an additional 40 years of synthetic record of annual maximum stage, based on a precipitation-stage relation, resulted in an estimate of 6,710.7 feet for the the lake altitude corresponding to the 100-year flood. LIMNOLOGICAL STUDY OF LAKE SHASTINA, SISKIYOU COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
A. E. Dong, K. W. Beatty, and R. C. Averett.
Water-Resources Investigations 19-74, November 1974. 52 p, 12 fig, 13 tab, 27 ref.

Descriptors: *Lakes, *Limnology, *California, *Eutrophication, Water quality, Water pollution sources, Nutrients, Oxygen demand, Thermal stratification, Algae, Nitrates, Phosphates.
Identifiers: *Lake Shastina(Calif).

Surface water constituted more than 90 percent of the approximately 50,000 acre-foot inflow to Lake Shastina, California, in the 1972 water year. Annual changes in the quantity of water in storage in the lake are related mainly to variations in annual inflow. The lake is thermally stratified from spring through autumn. Water near the surface was supersaturated with oxygen while an acute dissolved-oxygen deficiency existed at depth. Nitrogen and phosphorus in solution are partly stratified during thermal stratification. Algal types consisted mainly of green algae and diatoms. Blue-green algae were absent most of the year. Benthic organisms were primarily Oligochaete, Chironomidae, and Chaoborus, all of which are adapted to a low dissolved-oxygen environment. Nitrogen and phosphorus concentrations in the lake are sufficient to support large algal blooms. Recent development of shoreline properties may accelerate the eutrophication of the lake. (Knapp-USGS)

ANALYTICAL MODEL FOR A HEATED SUBMERGED DISCHARGE INTO BREAK WATER WALL AREA,
Wisconsin Univ., Milwaukee. Dept. of Energetics.
R. A. Jaisinghani, V. L. Shah, and K. C. Tsao.
In: Water For The Human Environment, Vol. IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 15-31. 3 fig, 4 ref.

Descriptors: *Heated water, *Water circulation, *Flow, *Dispersion, *Analytical techniques, Momentum equation, Energy equation, Turbulence, Model studies, Recreation, *Discharge(Water).
Identifiers: *Heated submerged discharge, Conservation equations.

The effects of a submerged thermal discharge in a shielded area created by a breakwater wall in the shore line of a lake or coastal area were studied to determine if such a shielded area could be used as a recreational area with relatively warmer water, especially in the fall and spring months, thereby increasing the length of the swimming season. The thermal discharge could be from a power plant or another source. A surface discharge would require dilution pumps to disperse the thermal energy within the shielded area, an operation involving high initial and operational costs. However, submerged discharges have high mixing characteristics and require fewer, if any, dilution pumps. The analytical model developed considered a three-dimensional, rectangular, turbulent, submerged, heated discharge. The conservation equations of mass, momentum, and energy were transformed from the Cartesian coordinates to coordinates suitable for a vertically deflected jet by assuming velocity and temperature profiles. The final integrated equations were presented in non-dimensional terms. These equations have not been used to test the applicability and validity of the solutions to practical problems. In: Water For The Human Environment, Vol. IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 76-88. 4 fig, 3 ref.

Descriptors: *Powerplants, *Thermal pollution, *Analytical techniques, Hydrodynamics, *Estuaries, Heat transfer, Tides, Cooling, Diffusion, Water temperature, Coriolis force, Computers, Model studies, *Mathematical models, Finite element analysis, Conservation, Equations.

The heat conservation equation in two horizontal dimensions with the equations of motion and continuity in vertically integrated form was solved for the spatial transient temperature rises in a body of water due to thermal discharge of artificial origin. Flow patterns and water level variations induced by the plant intake and discharge, stream inflow and outflow, meteorological parameters, and tidal agitation can be obtained from the mathematical model. The multioperational method (alternate direction implicit) used in the solution for the finite difference equations of the governing partial differintial equations is unconditionally stable and appears economical. The model makes it possible to investigate environmental design considerations in conjunction with cooling system alternatives, plant operating modes, and hydrological and meteorological conditions, and to minimize the effects of thermal discharges to the environment. A case study was presented in which a multiport submerged diffuser was employed. The hydrothermal condition which prevailed in the study area was numerically simulated and the results were depicted in computer-plotted graphs. (See also W75-04213) (Singh-ISWS)

RELATIONSHIP BETWEEN LIMNOLOGICAL CONDITIONS OF RESERVOIRS AND WATERSHED FEATURES - A SURVEY,
Ministry of Public Works, Madrid (Spain). Section of Sedimentation and Natural Pollution.
J. R. de la Torre, J. L. O. Casas, J. A. Garcia, and R. P. Martinez.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 401-410. 1 fig, 2 tab.

Descriptors: *Surveys, *Limnology, *Reservoirs, *Watersheds(Basins), Lake morphometry, Chemical properties, Physical properties, Water quality, Vegetation, Geologic formations, Climatic data, Biological properties.
Identifiers: *Spain.

A survey was performed in 42 reservoirs and their watersheds, located in southern Spain, in order to determine qualitative relationships between limnological parameters and basin features. Comparison between reservoirs also included shoreline colonizer plants. As a result of the survey, a five-stage impoundment classification was outlined from the eutrophication or nutrient-enrichment standpoint. A further classification was advanced for the presumed water degradation rate, based upon current status, age of impoundment, turnover rate and morphometric parameters. Floristic composition of shoreline colonizer plants appears to be well correlated with hydrological regulation patterns through the magnitude of impounded water level fluctuation. Yet, no significant classification of shore plants proved feasible, regarding limnological or morphometric parameters. Morphometric parameters, watershed features, and limnological parameters were tabulated for each reservoir surveyed. (See also W75-04213) (Humphreys-ISWS)

2I. Water In Plants

STEADY FLOWS OF WATER AND SALT IN UNIFORM SOIL PROFILES WITH PLANT ROOTS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
P. A. C. Raats.
Soil Science Society of America, Proceedings. Vol. 38, No. 5, September-October, 1974. p 717-722, 8 fig, 20 ref.

Descriptors: Flow, *Infiltration, *Hydraulic conductivity, *Leaching, *Soil-water-plant relationships, Transpiration, Salts, Pressure head, Root zone, Saturated soils, Water table.

Upward and downward flows of water in the presence of uptake by plant roots is analyzed. Calculations are based upon an exponential increase of the hydraulic conductivity with the pressure head and an exponential decrease of the rate of uptake with depth. For downward flows, the distribution of the matric flux potential can be expressed as a function of the rate of infiltration, the leaching fraction, and two parameters describing the soil and the uptake distribution. For upward flows, the distribution of the matric flux potential can be expressed as a function of the rate of infiltration, the rate of transpiration, the hydraulic conductivity of the saturated soil, and the same two parameters describing the soil and the uptake distribution. An evaluation is also made of the distribution of salts associated with the steady downward flows. (Mastic-Arizona)

RELATIONSHIPS OF RING WIDTHS IN ARID-SITE CONIFERS TO VARIATIONS IN MONTHLY TEMPERATURE AND PRECIPITATION,
Arizona Univ., Tucson. Lab. of Tree-Ring Research.
H. C. Fritts
Ecological Monographs, Vol. 44, No. 4, 1974. p 411-440, 4 tab, 13 fig, 30 ref.

Descriptors: *Trees, *Arid climates, *Regression analysis, *Dendrochronology, *Arid lands, Temperatures, Precipitation(Atmospheric), Ecosystems, Seasonal, Climates, Altitude, Plant growth, Microenvironment.
Identifiers: *Tree rings, Cluster analysis, Dendroclimatology.

The effects of temperature and precipitation on the diameter growth of arid-site conifers were evaluated using newly developed empirical techniques. One technique employs multiple regression on principal components of climate. The other technique is a cluster analysis which is used to identify similarities among the response functions and then classify them by similarities and differences. Precipitation was directly related to growth throughout the year for 32 percent of the sites, but on the remaining 68 percent the effects of precipitation varied from season to season. Temperature was most commonly inversely related to ring width during autumn, spring and summer for arid-site conifers, but in cases of high altitudes, high latitudes, or on north facing slopes, a direct relationship was often noted. The variety of ring-width responses to climatic variations suggested a need for more physiological studies of trees on arid or other extreme sites which may reveal unique growth-environment relationships that have not been observed on the more optimum sites. A FIELD STUDY OF THE HEAT AND DROUGHT TOLERANCE OF GRAIN SORGHUM (SORGHUM BICOLOR (L.) MOENCH) AS AN APPROACH TO GENETIC IMPROVEMENT,
Nebraska Univ., Lincoln. Dept. of Agronomy.
V. B. Ogunlela.

Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 238, $4.75 in paper copy, $2.25 in microfiche. M.S. Thesis, August 1974. 93 p, 23 tab, 66 ref, append. OWRT A-026-NEB(1).

Descriptors: *Water utilization, Crop production, *Drought tolerance, *Grain sorghum, Genetics, Plant breeding, Heat, Measurement, Leaves, Electrical conductance.
Identifiers: *Heat tolerance(Plants), Leaf tissue(Plants).

The purpose was to study the feasibility of selecting for heat and drought tolerance among sorghum genotypes under field conditions. A field study was conducted on 21 grain sorghum lines to screen them for heat and drought tolerance using a combination of laboratory techniques and field measurements. These lines had previously been classified into three groups of heat tolerance (high, medium and Low) based on a 1972 study. An electrical conductivity method using leaf discs was employed to test for heat and drought tolerance of leaf tissue during the growing season. Several agronomic characteristics were measured and related to heat and drought tolerance. These included flag leaf area, area of the four top leaves, grain yield per head, 1,000-seed weight, grain yield per hectare, plant height, 50% bloom date and number of heads. Results have shown that some closely related sorghum lines are consistently more heat or drought tolerant than others, and that techniques can be applied to separate these lines into distinguishable categories with regard to responses to these environmental stresses. A positive correlation often existed between heat and drought tolerance in these grain sorghums.
W75-04044

SOME CONSIDERATIONS ON PLANT TYPES FOR DRYLAND AGRICULTURE,
Central Arid Zone Research Institute, Jodhpur (India).
M. V. R. Prasad.
Annals of Arid Zone, Vol 12, No 3 and 4, September/December, 1973. p 125-134, 2 tab, 46 ref.

Descriptors: *Crop production, *Agriculture, *Arid lands, *Drought resistance, *Soil-water-plant relationships, Drought, Dry farming, Plant breeding.

An analysis of crop growth on unirrigated lands was made to determine the factors most important in selecting plant types for dry land agriculture. Crop varieties that are currently cultivated are those that have been selected for their ability to resist drought rather than productivity. Attributes that are essential for plant survival are not necessarily the same needed for productivity. In order to better insure against crop failure, it is necessary to develop plant types suitable for mixed cropping, taking competitive ability and complementary characteristics into consideration. Plant breeding is warranted for eliminating undesirable traits and combining drought resistance and productivity characteristics suitable for dryland agriculture. (Mastic-Arizona)
W75-04126

THE EFFECT OF INTERVAL AND INTENSITY OF DEFOLIATION ON THE DRY MATTER PRODUCTION OF SOME IMPORTANT GRASS SPECIES OF WESTERN RAJASTHAN,
Indian Grassland and Fodder Research Inst., Jhansi.
P. M. Dabadghao, R. Deb Roy, and S. P. Marwaha.
Annals of Arid Zone, Vol 12, No 1 and 2, March-June 1973. p 1-8, 1 tab, 13 ref.

Descriptors: *Grasses, *Plant growth, *Pasture management, *Production, Rainfall, Weather.
Identifiers: Lasiurus sindicus Henr., Panicum antidotale Retz., Cenchrus ciliarus Linn., Cenchrus setigerus Vahl.

The effect of three intervals and three intensities of defoliation on dry matter production of Lasiurus sindicus Henr., Panicum antidotale Retz., Cenchrus ciliarus Linn., and Cenchrus setigerus Vahl., were studied in Rajasthan. During a 30 day dry interval L. sindicus and C. setigerus produced greater yields, irrespective of variation in rainfall. Similar results were observed for C. ciliarus and P. antidotale only in drought years. Clipping at 15 cm. stubble height in L. sindicus gave maximum yields irrespective of the season. Interaction between interval and intensity of clipping was significant only in L. sindicus and P. antidotale. A safe degree of utilization appears to be 15 cm. in all species, particularly in L. sindicus and C. setigerus; however, C. ciliarus and P. antidotale can be used down to 10 cm. under proper management. (Mastic-Arizona)
W75-04131

EFFECT OF QUALITY OF IRRIGATION WATER ON DRY MATTER PRODUCTION, AND ON CALCIUM, MAGNESIUM AND PHOSPHORUS CONTENT OF WHEAT, BARLEY AND PEA,
Udaipur Univ. (India). Coll. of Agriculture.
M. U. Khan, and S. N. Saxena.
Annals of Arid Zone, Vol 13, No 1, March, 1974. p 11-16, 2 tab, 10 ref.

Descriptors: *Irrigation water, *Water quality, *Phosphorus, *Calcium, *Magnesium, *Plant growth, Wheat, Barley, Boron, Conductivity, Crops.
Identifiers: Pea, SAR(Sodium absorption ratio).

Conductivity, SAR (sodium absorption ratio) and boron content of applied irrigation water were evaluated for barley, wheat, and pea. In all 3 crops, increasing levels of the 3 variables caused a suppression in dry matter production. Interactions of SAR with boron resulted in a definite increase in calcium, magnesium and phosphorus content in pea, but in barley and what the phosphorus content increased and the calcium and magnesium contents decreased. Calcium absorption increased with an increase in conductivity in all three crops, but magnesium absorption increased in wheat and pea, and not in barley. Phosphorus content also increased in pea and wheat with increased conductivity. (Mastic-Arizona)

THE EFFECT OF VARIOUS RATES OF SEMICONTINUOUS DRIP IRRIGATION ON LETTUCE, (LACTUCA SATIVA L.) GROWN IN GREENHOUSE,
Oak Ridge National Lab., Tenn.
D. Shinshi, and J. W. Michel.
Available from the National Technical Information Service, Springfield, Va 22161 as ORNL-TM-4302, $4.00 in paper copy, $2.25 in microfiche. Nuclear Desalination Program, August, 1973. 36 p, 5 tab, 6 fig, 4 ref.

Descriptors: *Irrigation, *Irrigation effects, *Soil moisture, *Moisture stress, *Lettuce, *Soil-water-plant relationships, Moisture tension, Tensiometers, Plant growth, Evapotranspiration, Soil profile, Greenhouses, Regime.
Identifiers: *Drip irrigation.

The response of lettuce plants to semicontinuous drip irrigation treatments was studied under greenhouse conditions. Treatments corresponded to 100, 70, and 50 percent of the estimated potential evapotranspiration for three weeks, followed by one week where the 70 and 50 percent treatments were reduced to 50 and 35 percent respectively. Soil moisture tension was monitored throughout the soil profile by a grid of small tensiometers. During the first three weeks, the growth, dry matter accretion, and indices of plant water status in the three treatments were essentially equal. During the fourth week, the treatment that was restricted to 35 percent of potential evapotranspiration showed growth cessation and other signs of water-stress. It was suggested that a relatively high performance in plants may be maintained if water is supplied continuously even if the amount is markedly restricted. (Mastic-Arizona)

CHARACTERISTICS AND PREDICTION OF SOIL EROSION ON A WATERSHED IN THE PALOUSE,
Idaho Univ., Moscow.
L. Druffel.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 251, $5.25 in paper copy, $2.25 in microfiche. M Sc Thesis, May 1973. 95 p, 8 fig, 4 tab, 5 append. OWRR A-029-IDA(5).

Descriptors: *Soil erosion, Regression analysis, *Erosion, *Idaho, Watersheds(Basins), *Data collections, *Forecasting.
Identifiers: *Palouse region(Ida).

The objective was to study the process of soil loss by water on a watershed and determine the effect of various hydrologic parameters. The 1971-72 wateryear provided good data and 3.71 tons/acre soil loss was measured on a storm basis. The annual figure is estimated to be 4 tons/acre which would include unmeasured events and low flow periods with minimal losses. The 1972-73 wateryear was a poor year from the standpoint of erosion data as it was quite dry. However, three of the events which occurred were of the frozen

ground type which provided valuable hydrologic data. Frozen ground events were deleted from the erosion data analysis. The soil loss events that were not on frozen ground were analyzed on a storm basis and a predictive equation for use on this watershed was developed by multiple regression techniques using several hydrologic parameters. Soil loss was found to depend mainly on amounts and timing of precipitation, volume of runoff, snow melt, and the conditions of the soil. The data collected yielded good results but left unanswered the question of the effect of cropping pattern, tillage practice, slope, slope length, and slope aspect on soil erosion. These parameters are all very important to amount of soil loss but did not vary in this case because the work was done on one watershed with one cropping practice.

A REVIEW OF DESERTIZATION IN AFRICA--WATER, VEGETATION, AND MAN,
Secretariat for International Ecology (Sweden).
A. Rapp.
Secretariat for International Ecology, SIES Report No. 1, 1974. 77 p, 25 fig, 4 tab, 81 ref.

Descriptors: *Africa, *Deserts, *Desert plants, *Arid climates, *Arid lands, *Reclamation, *Remote sensing, Wind erosion, Vegetation effects, Vegetation establishment, Surveys, Monitoring, Rainfall, Grazing, Dry farming, Degradation, Soils, Soil stability, Soil erosion.
Identifiers: *Desertization.

The causes of actual desertization in the African arid countries are discussed based on available literature, reports by and interviews with experts, and visits to field projects. Desertization is primarily man-caused as a result of overgrazing, overcultivation, wood cutting, and burning. This overexploitation destroys the plant cover required to protect the soil against rapid erosion by wind or water. To serve as a basis for checking the spread of desertization, it is recommended that surveys and monitoring of desertization should be systematically undertaken in selected transects. In addition, pilot trial plots should be used for the purpose of research and development of ecologically sound methods of desert land use. (Mastic-Arizona)

HYDRAULIC AND FLOW STUDIES RELATED TO SEDIMENT TRANSPORT, KENTUCKY RIVER, KENTUCKY,
Kentucky Water Resources Inst., Lexington.
B. R. Moore.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 259, $4.25 in paper copy, $2.25 in microfiche. Research Report No. 81, 1974. 58 p, 7 fig, 2 tab, 3 ref, 2 append. OWRT A-054-KY(1), 14-31-0001-4017.

Descriptors: *Sediment transport, *Scour, Dredging, Kentucky, Open channel flow, Hydraulics, *Sands, Waste disposal, *Path of pollutants, *Sediment distribution, Distribution patterns.
Identifiers: *Kentucky River(Kent), Ohio River(Kent).

This study related the conditions of flow and channel shape to distribution of sediment types in the Kentucky River. Seven distinct types of sediment association were delineated and these have a regular pattern of distribution influenced by the presence of navigation locks and dams. The most suitable locations for commercial extraction of bed material were clearly indicated and the variations of sand size delineated. The irregular discharge pattern of the stream indicates potential problems in the disposal of solid waste pollutants. A remeasurement of the dredge hole in the Ohio River indicated a continuation of the same vortex scour action and sand deposition analysed in earlier work. QUALITY AND AVAILABILITY OF WATER IN WESTERNMOST TEXAS,
Geological Survey, El Paso, Tex.
J. S. Gates.
Open-file report, 1975. 8 p.

Descriptors: *Water quality, *Groundwater, *Surface waters, *Water resources, *Texas, Alluvium, Return flow, Sulfates, Chlorides, Water supply, Water yield
Identifiers: *El Paso(Tex).

In westernmost Texas, the availability and quality of water are dominated by the natural dissolved-mineral content. The predominant dissolved minerals are sodium chloride and calcium sulfate. The quality of water in the Rio Grande varies with the amount of discharge and with location along the stream. During the spring and summer, the mineral content of water in the Rio Grande at El Paso is about 600 to 700 mg/liter. At this time, water is being released from reservoirs upstream, and the discharge consists mostly of surface runoff. During the fall and winter when no water is released from the reservoirs, the discharge is derived mostly from groundwater seepage into the river, and the dissolved-solids concentration at El Paso, which is dominantly sodium sulfate, normally ranges from 1,000 to 2,000 mg/liter or more. Much of this groundwater seepage represents return flow of irrigation water applied to the Mesilla Valley. This return flow contains minerals leached from the soil, and it is concentrated because part of the water originally applied to the land was lost by evaporation and transpiration. At the lower end of the Hueco Bolson at Fort Quitman, the mineral content of water in the Rio Grande ranges from 1,000 to 3,000 mg/liter or more at all times of the year, and reached 10,700 mg/liter in June 1953. Most of the water for municipal and domestic supply in westernmost Texas is groundwater. The total amount of water pumped from deep wells in the El Paso area in 1972 for municipal and military supply, industrial use, and irrigation was about 115,000 acre-feet. Most of this water contained less than 500 mg/liter dissolved solids. (Knapp-USGS)

SPECIAL TECHNIQUES FOR DETERMINING CHEMICAL PROPERTIES OF GEOTHERMAL WATER,
Geological Survey, Menlo Park, Calif.
T. S. Presser, and I. Barnes.
Available from NTIS, Springfield, Va. 22161 as PB-235 148, $3.25 in paper copy, $2.25 in microfiche. Water-Resources Investigations 22-74, August 1974. 11 p, 1 tab, 3 ref.

Descriptors: *Water analysis, *Geothermal studies, *Chemical analysis, *Analytical techniques, Sampling, Methodology, On-site investigations, Thermal water, Laboratory tests, Aqueous solutions, Water chemistry, Trace elements, Heavy metals, Hydrogen ion concentration, Filtration
Identifiers: *Water sample preservation, Field preparation, Water sample stability.

A reliable determination of the chemical composition of geothermal fluids may require special sampling and preservation techniques. A sample collected without pretreatment is usually adequate for the analysis of sodium, potassium, and chloride. Other constituents may require further treatment of even analysis in the field, depending on the data requirements. The collection and preservation methods described permit accurate results for 31 chemical variables, including major and minor chemical constituents. (Woodard-USGS)

AQUATIC SURVEY OF THE KONA COAST PONDS, HAWAII ISLAND,
Hawaii Univ., Honolulu. Sea Grant Program.
R. E. Brock.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM 74-11037, $4.75 paper copy, $2.25 microfiche. Report No. UNIHI-SEAGRANT-AR-74-04, April 1974. 73 p, 10 ref, 6 append. NOAA Grant 04-3-158-29.

Descriptors: *Aquatic habitats, *Intertidal areas, *Hawaii, *Biological communities, *Aquatic environment, Fish, *Ponds, Surface waters, Aquatic weeds, Aquatic plants, Balance of nature, Habitats, Marine biology, Ecology, Salinity, Temperature, Dissolved oxygen, Geology.
Identifiers: Kona Coast, Anchialine ponds, Coastal ponds.

During a 17-month period beginning July 1972, 318 shoreline ponds were located and surveyed in the five land districts of Hawaii Island's leeward coast. The survey concerned an inventory of environmental and biological characteristics for the purpose of assessing their scientific and natural resource values. This inventory included all coastal waters--from excavated wells and small fissures to large Hawaiian fishponds--that are not part of the marine ecosystem. Relevant information on geology and terrestrial vegetation was presented. Collectively, the ponds have distinctive environmental features. Characteristic aquatic vegetation consists of the vascular aquatic pondweed, Ruppia maritima, and two types of encrusting algal communities. Pond animal communities were divided into two main groups depending upon their connections to the sea. The 13 ponds with surface connections to the sea have diverse species that are mainly of marine origin. The remaining 305 ponds with only subterranean water connections contain fewer but more distinctive animals. In these 'closed' ponds, crustaceans and mollusks are the most abundant and characteristic animals among the 55 taxons recognized. Detailed maps and biota catalogs were provided. (Henley-ISWS)
W75-04275

A DRIFT CARD STUDY IN MONTEREY BAY, CALIFORNIA: SEPTEMBER 1971 TO APRIL 1973,
California State Univ., San Jose. Dept. of Natural Science.
D. D. Blaskovich.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74-11266, $4.75 paper copy, $2.25 microfiche. Technical Publication 73-4, 1973. 79 p, 17 fig, 4 tab, 35 ref, 1 append. SGP2-94.

Descriptors: *Oceanography, *Ocean circulation, *Ocean currents, Tides, Pacific Ocean, Bays, *California, Winds, *Drifting(Aquatic), Movement, On-site data collections, Seasonal.
Identifiers: *Monterey Bay(Calif) Drift cards.

Drift cards were released in Monterey Bay, California, to detect seasonal variations in the California Current system, and seasonal and diurnal wind variations in the immediate vicinity of the bay. About 23% of the cards were recovered, although the recovery rate varied from about 5% in the winter to about 60% in the late summer. Drift card speeds ranged from 1 to 8 km/day, in the winter and summer months respectively. Good agreement was observed between geostrophic currnt, wind, drogue, and drift card data, although drift cards were observed to be primarily wind driven. A weekend bias in drift card recoveries was observed for the entire period of study; however, it was less pronounced for those cards released during the summer months. Two bogus releases were used to estimate the discovery lag time, reported position accuracy, and longshore drift currents. Diurnal winds were observed during a 24-hour study which indicated that daily variations in the wind field may be as important as seasonal changes in moving surface water. The drift card speed was observed to be about 3% of the wind velocity, and 1 m/sec was estimated as the minimum effective wind. The wind factor, ranging from 2.2% to 4.0%, was used to estimate the actual paths of drift cards and to examine the role of diurnal winds in affecting surface water movement. (Gibb-ISWS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

MILTI-STAGE FLASH EVAPORATOR,
Aqua-Chem, Inc., Milwaukee, Wis. (assignee)
P. J. P. Liu.
US Patent No 3,855,072, 5 p, 5 fig, 14 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 1188, December 17, 1974.

Descriptors: *Patents, *Evaporators, *Condensation, *Heat exchangers, *Desalination, *Distillation, Sea water, Water treatment, Vapor compression distillation, Equipment, *Flash distillation.
Identifiers: *Flash evaporation, Multi-stage flash evaporators.

A flash evaporator has at least one flash chamber divided into an evaporating space and a condensing space. Heat exchange tube bundles are disposed in the condensing space and extend in a direction generally transverse to the direction of feed water flow through the chamber. The heat exchange tube is arranged such that a first margin is exposed to the vapors flashed in the chamber and a vent is located in a second unexposed margin. The straight line of distance from any point on the exposed margin is equal and the number of tubes to which the vapors are exposed constantly decreases as the vapors traverse the tube bundle from the exposed margin to the vent. APPARATUS FOR SOLAR DISTILLATION,
H. R. Hay.
U. S. Paten No 3,846,251, 6 p, 9 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 250, November 5, 1974.

Descriptors: *Patents, *Distillation, *Solar stills, *Solar distillation, *Waste water treatment, Separation techniques, Equipment.

The app the distilland basin and the substances with it. The substances may be liquids or solids, absorbent or non-abisorbent, for aiding in the process of recovery of water from the atmosphere. The movement of natural or forced air over the distilland basin at night results in the deposition of water subsequently recovered by solar distillation during the daytime. The cover is radiation-transmitting, - it is transparent or translucent to solar rays and is capable of transmitting energy to convert distilland to vapors condensed on the cover. One or more distilland-retaining components is exposed to the night sky for purposes of lowering their temperatures below that which would be obtained if the cover remained. By forcing the air through the still during the nighttime when the outside air has a higher moisture content than air within the still allows the deposition of dew to occur in convenient areas for recovery. (Sinha-OEIS)
W75-03876

HOT BALL DESALINATION PROCESS,
Occidental Petroleum Corp., Los Angeles, Calif. (assignee).
J. R. Phillips.
U. S. Patent No 3,843,462, 8 p, 9 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 927, No 4, p 1622, October 22, 1974.

Descriptors: *Patents, *Desalination, *Distillation, *Condensation, *Flash distillation, *Waste water treatment, Sea water, Brackish water, Fresh water, Potable water, Equipment.

A daeslination system utilizes the following steps: pressurizing the saline water to insure that it will remain liquid during heating; heating a stream of the pressurized relatively cool saline water to at least the flash distillation temperature of the initial flash distillation stage by counter-currently flowing a moving stream of heated pellets through the stream of saline water, the saline water being pressurized throughout the zone of contact with the pellets and remaining liquid; separating the exiting, thus relatively cooled pellets from the stream of heated saline water; and transferring the stream of heated saline water free of pellets to the initial flash distillation stage. Then the pressure and temperature are reduced to condense the water vapor produced by the distillation on the surfaces of the separated relatively cooled pellets. The condensate may then be removed for collection and the pellets returned for reuse. (Sinha-OEIS)
W75-03878

REGIONAL WATER SUPPLY DEVELOPMENT UTILIZING BRACKISH WATER RESOURCES IN THE SOUTHERN ARAVA REGION,
Mekorot Water Co. (Israel).
P. Glueckstern, Y. Kantor, and A. Ardman.
Presented at the International Symposium on Brackish water s a Factor in Development, held at the Ben-Gurion University of the Negev, Beer-Sheva, Israel, January 5-10, 1975. 21 p 5 tab, 6 fig, 3 ref.

Descriptors: *Brackish water, *Sea water, *Desalination, *Semiarid climates, *Water quality, Evaluation, Water supply development, Reverse osmosis, Potable water, Drinking water, Arid climates.
Identifiers: *Israel (Arava Valley).

Economic evaluations of alternative development programs were made for a semiarid region presently dependent on brackish and desalinated sea water for its water supply. Results showed that at prevailing energy prices the total coast of desalting brackish water is considerably lower than the energy cost only of desalting sea water. An economic incentive now exists to supply blended water of the lowest acceptable quality. Because of the current energy prices and differences in cost between desalted sea water and brackish water, the alternative of using all of the still undeveloped brackish water resources is by far the most economic. PUTTING THE SUN TO WORK: A HISTORY AND DIRECTORY OF CURRENTLY AVAILABLE SOLAR ENERGY APPLICATIONS,
Arizona State Fuel and Energy Office, Phoenix. Conservation Section.
K. Bacher.
State of Arizona, Office of the Governor, Arizona State Fuel and Energy Office, 1974. 27 p, 3 fig, 19 ref.

Descriptors: *Solar radiation, *Solar stills, *Heated water, *Thermal radiation, *Desalination, Desalination apparatus.
Identifiers: *Solar energy systems, *Solar cells, *Solar water heaters, *Solar thermal energy.

The purpose of this brochure is to inform the public of the equipment and uses of solar energy currently available. Brief discussions are presented of heliothermal, helioelectric, and heliochemical collection methods. Current systems employing solar energy are also discussed, and include water heaters which can be used in various systems to provide increased hot water to the residence, or to heat and cool houses. Other uses include solar stills for converting small amounts of brackish or sea water to fresh water, solar ovens and broilers, and swimming pool heaters. In addition to new and experimental systems being developed, equipment is available to 'retro-fit' existing facilities. A list of firms supplying solar equipment and references to solar energy books and articles is contained in the brochure. (Mastic-Arizona)

VEGETATION MANAGEMENT FOR INCREASED WATER YIELD IN ARIZONA,
Arizona Univ., Tucson. Dept. of Watershed Management.
P. F. Ffolliott, and D. B. Thorud
Technical Bulletin 215, Agricultural Experiment Station, University of Arizona, Tucson, September 1974. 38 p 19 fig.

Descriptors: *Watershed management, *Water yield improvement, *Riparian plants, *Forestry, *Arizona, Ponderosa pine trees, Chapparal, Coniferous forests, Desert plants, Grasslands, Pinyon pine trees, Juniper trees, Alpine, Vegetation, Precipitation (atmospheric), Isohyets, Forest management.

A brief summary is presented of an analysis designed to define the potential for increasing water yields from watersheds in Arizona. Nine vegetation zones were recognized and characteristics and water yield improvement opportunities of each are given. The zones include the alpine, mixed conifer forests, aspen forests, ponderosa pine forests, pinyon-juniper woodlands, chapparal, grassland, desert shrub, and riparian association zones. A general methodology was used to obtain estimates of yield potentials by dividing Arizona into 15 drainage areas on which the vegetation zones were mapped. Total acreage for each area and zone was obtained from land ownership patterns. Finally, precipitation isohyets were superimposed to enable estimates to be made of potential amounts of water available in each area. This study suggests that the potential for

water yield improvement is significant particularly in the mixed conifer and ponderosa pine forests, and the chapparal zones. The range in potential water yield was calculated to be approximately 600,000 to 1,200,000 acre-feet per year. (Mastic-Arizona)
W75-03961

HYDROLOGIC DATA FOR 1973, BROWARD COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
H. W. Bearden.
Open-file report, 1974. 64 p, 42 fig, 5 tab, 18 ref.

Descriptors: *Hydrologic data, *Surface waters, *Groundwater, *Water quality, *Florida, Data collections, Rainfall, Runoff, Groundwater movement, Canals, Water management(Applied), Water analysis, Water yield improvement.
Identifiers: *Broward County(Fla).

This report, the third of an annual series, includes hydrologic data for Broward County, Florida for the 1973 water year. These data are compared with long-term records from rainfall, groundwater, surface-water, and water-quality stations. The average water-year rainfall, on the basis of 30 years of record (1943-1972), is 58.60 inches. Rainfall averaged 49.08 inches during the 1973 water year. Groundwater levels in the county during the 1973 low-water period were almost as low as during the 1971 record low-water period, although January-April rainfall was 7.58 inches in 1973 and 1.94 inches in 1971. Discharge throughout the surface flow system in Broward County was dependent on the intensity and duration of rainfall until the establishment of the water-management system in the county. Major modifications to the regional canal system began about 1953 and were virtually complete by 1962. The extreme flows have been greatly modified and the duration of moderate or optimum flows greatly lengthened. The chief threat to surface-water quality in urban areas is manmade contamination. Total coliforms exceeded the permissible limits for Class III waters (Recreation-propagation and management for fish and wildlife) and water for public supply in Broward canals except at site 43 in Snake Creek Canal during the 1973 water year. GENERAL DISPOSITION AND AQUATIC ENVIRONMENTAL EFFECTS OF SILVER IODIDE IN PRECIPITATION MANAGEMENT,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
H. L. Teller, D. A. Klein, and D. R. Cameron.
In: Water For The Human Environment, Vol. IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 537-547. 1 fig, 7 tab, 7 ref.

Descriptors: *Weather modification, *Snow management, *Silver iodide, *Nucleation, *Hail, Cloud seeding, Water supply, Precipitation(Atmospheric), Storms, Winds, Air circulation, Meteorology, Aquatic environment, Mud, Ecosystems, Anaerobic bacteria, Microbial degradation, Cellulose, Grasslands, Vegetation, *Colorado.
Identifiers: *San Juan Mountains(Colo), Ground-based generator, Pyrotechnic devices, Hail suppression.

Studies of silver disposition on a winter-orographic and a summer-convective precipitation management project showed that additions of silver from cloud seeding are unlikely to be detectable by available methods. Apparent seasonal variation, but no increase in silver levels, was observed on both target areas. Silver accumulation in litter and soil, and uptake by plants, did occur at a ground-generator site. The addition of silver at 1 and 10 ppm to an aquatic mud environment resulted in an apparent decrease in cellulose decomposition in a laboratory test. Similar additions of silver compounds to the cellulose substrate itself appeared to enhance decomposition rates. Silver additions to aquatic mud environments may have discernible effects on microbial degradation processes. Silver and nitrogen appear to have opposing effects on these microbial activities, and the iodide, of itself, may cause changes in degradation rates. The observation of possible increased degradation when silver is directly in contact with substrates indicated that additional, more subtle, effects on decomposer processes may be occurring. PROJECT SKYWATER.
Nevada Univ., Reno. Desert Research Inst.
Available from the National Technical Information Service, Springfield, Va 221611 as PB-231 460, $6.25 in paper copy, $2.25 in microfiche. Supplementary Final Report, July 1, 1972-September 30, 1973. 155 p, 135 fig, 7 tab. Contract No. 14-06-D-6632-1968.

Descriptors: *Weather modification, *Storms, Cloud seeding, Climatology, Cloud physics, Instrumentation, Radar, Data collections, *Nevada, *California, *Meteorology.
Identifiers: Storm patterns, *Sierra Nevada Mountains.

As the primary source of water for much of Nevada and California, the winter storms that bring moist Pacific air over the central Sierra Nevada mountain range were studied intensively over the past few years. The data acquisition systems and reduction procedures used were described, with particular emphasis on the systems aboard the instrumented B-26 aircraft. With a goal of determining the structure and organization of the winter storms, the data from six specific storms were presented in detail. While there is much variability between the different storms, there is nevertheless a tendency for the higher liquid water contents to occur at low levels along the western edge and over the main crest in all the storms studied. 3C. Use Of Water Of Impaired Quality

THE INFLUENCE OF SOIL SALINITY UPON FRUITING AND SHEDDING, BOLL CHARACTERISTICS, FIBER QUALITY, AND YIELDS OF TWO COTTON SPECIES,
Texas A and M Univ., El Paso. Agricultural Research Station.
D. E. Longenecker.
Soil Science, Vol 115, No 4, April, 1973. p 294-302, 6 tab, 1 fig, 13 ref.

Descriptors: *Cotton, *Soil water, *Salinity, Salts, *Irrigation, *Irrigation water, Saline water, Moisture stress, Moisture deficit, Plant growth, Crop production, Root zone, Salt tolerance.

The effects of substrate salinity were visible in both cotton species by reduction in plant growth and yields which were more evident at the highest salinity level of 8000 ppm salt in the water. Both Acala and Pima cotton species were affected in a similar manner which appeared to be primarily a stunting of growth. Also evident was a reduction in stem diameter, total number of fruiting forms initiated, total number of squares shed, total number of bolls matured, weights of both seed and lint per boll, and fiber length. The possibility exists of substituting moderate salinity for some degree of induced moisture stress which is believed to be desirable in late summer in order to slow vegetative growth and enhance fruiting. Application of saline water may be more desirable since plant moisture stress could be induced without the danger of acute moisture deficiencies caused by too long a delay of irrigation waters. Geological Survey, Carson City, Nev.
H. A. Shamberger.
Available from Nevada Historical Press, Star Route 1, Box 751, Carson City, Nev. 89701, $5.00. Nevada Historical Press, Carson City, Nevada, 1974. 80 p.

Descriptors: *Mining, *Water supply, *Nevada, *History, Water rights, Municipal water, Industrial water.
Identifiers: *Wonder(Nev).

The Wonder Mining District, Nevada, was one of 12 substantial mining districts that blossomed and boomed during the first decade of this century. While it was not so flamboyant as some of the other mining camps which flourished during this period, it was one of the most stable, as well as one of the most productive. Only a very few of the old mining camps in Nevada were situated near an adequate water supply for either the mining camp or town or for its mills. When a mining camp began developing, and where such development indicated that the camp would be a producer, one of the first problems encountered was where to obtain a water supply. The town of Wonder was somewhat of an anomaly with respect to its water supply, as compared to other mining camps. Within two months after the Wonder townsite was recorded in 1906, it was announced that Bench Creek water rights were purchased and piped to the town. On December 23, 1907, the company's mining operation filed application No. 760 to appropriate the waters of Sage Hen Creek for mining and milling purposes. (Knapp-USGS)

MEANS FOR ROTATABLY SUPPORTING AN OVERHEAD IRRIGATION PIPE,
Lindsay Mfg. Co., Nebr. (assignee)
A. L. Zimmerer, B. J. Zimmerer, and P. B. Zimmerer.
US Patent No 3,851,659, 3 p, 5 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 929, No 1, p 117, December 3, 1974.

Descriptors: *Patents, *Irrigation systems, *Water distribution(Applied), *Water management(Applied), Distribution systems, Pipes.

A self-propelled irrigation system has a water distribution pipe movable along a predetermined path and a means for supplying water to the pipe. Spaced apart, self-propelled towers along the length of the pipe support it above the ground and propel the pipe along its predetermined path. At least some of the towers have a sleeve through which the pipe freely rotatably extends to permit the towers to traverse irregular ground without imposing twist stress in the pipe. At least some of the towers are rigidly connected to the pipe so as to prevent rotational movement of the towers with respect to the pipe. (Sinha-OEIS)
W75-03867

TRICKLE IRRIGATION SYSTEM,
J. R. Nye.
U. S. Patent No 3,843,056, 4 p, 4 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 927, No 4, p 1500, October 22, 1974.

Descriptors: *Patents, *Irrigation systems, *Irrigation practices, Equipment, Conservation, Land management, Water management(Applied), Crop production.
Identifiers: *Trickle irrigation.

The irrigation system includes a water supply source and a field of discharge pipes for dispensing water over the ground about growing crops. A pump is interconnected between the water supply source and the discharge pipe field. A first switch connects an electrical power source to the pump for activating and deactivating the pump. A second switch which includes means responsive to the rate of water flow through the pump or system will cause the pump to be deactivated when the water flow drops below a selected minimal flow rate. Also included is a means which isolates or deactivates the second or flow responsive switch for a short period of time when the first switch is initially shifted into its 'on' position to start the pump. This allows the irrigation system to be primed and air-purged without deactivation of the pump. The control unit for the irrigation system is contained within a compact housing which is adapted to rest upon the ground. A warning means, such as a light indicator, serves to note when the pump is deactivated through the operation of the second or flow responsive switch. (Sinha-OEIS)
W75-03877

INFLUENCE OF TOBACCO PLANT CANOPY ON PERCOLATION,
North Carolina State Univ., Raleigh.
D. L. Terry.
Agron J 65(5): 794-796, Illus. 1973.
Identifiers: Leaching, Lysimeters, Nicotiana-tabacum, *Percolation, Tension, *Tobacco, Loam, Sands, Soils, Plant canopy.

The relationship between percolation at various positions in Lakeland sand and Norfolk loamy sand soils under tobacco (Nicotiana tabacum L.) culture and the growth and development of the plant canopy was studied. A procedure is described for making direct measurements of percolation at various positions at a depth of 30 cm in a soil with respect to plant location as follows: (A) through a ridge directly below a plant; (B) through a ridge half way between 2 plants; (C) through a fallow ridge; and (D) through a fallow level area. During the 1st 15-20 days of the season percolation was similar at all positions studied and amounted to 40-60% of an average rainfall. From about 40 days after transplanting to the end of the growing season percolation at position A was about 40-100% of the rainfall while that at B and C was near zero. Percolation at D was intermediate averaging around 1/2 that of A. The large amount of percolation at A after canopy development was explained as the result of water being intercepted by the leaves and channeled to the base of the stalk. Percolation and possible leaching below 30 cm in a tobacco field are significant during the early part of the season (15-20 days from transplanting or later); however, after canopy development (40-49 days from transplanting or earlier) they are probably not significant except in a small soil volume directly below the plants.--Copyright 1974 Biological Abstracts, Inc.

APPRAISAL OF IRRIGATION PROJECTS AND RELATED POLICIES AND INVESTMENTS,
Ministry of the Presidency, Mexico City.
L. M. Bassoco, R. D. Norton, and J. S. Silos.
Water Resources Research, Vol 10, No 6, p 1071-1079, December 1974. 2 fig, 4 tab, 14 ref.

Descriptors: *Irrigation, *Projects, *Linear programming, *Investment, *Irrigation districts, *Mexico, Optimization, Decision making, Economics, Evaluation, Agriculture, Simulation analysis, Mathematical models, Systems analysis, Water policy.
Identifiers: Public policy, Interdependence.

Seven examples of analysis with linear programming models are presented to illustrate methods of treating interdependence in the appraisal of irrigation projects. The optimization

models are applied to public policy decisions in an environment where decision makers are concerned with the simultaneous use of several instruments of economic policy. Considered are the types of interdependence which affect the evaluation of irrigation investment projects and the use of linear programming for capturing this interdependence and for reflecting alternative goals in project evaluation. The kinds of interdependence analyzed are: (1) between investment projects and other policy instruments; (2) among different types of investment projects; and (3) between local and sector-level decisions on investment outlays. All three kinds are analyzed by linear programming models of irrigated agricultural producing areas, mostly with parametric programming experiments on these models. The models simulate producers' responses under different specified public policies. The applications discussed refer to irrigation districts in the central plateau and northwestern littoral of Mexico. Parametric linear programming is shown to be a useful tool for coping with this interdependence even in the absence of full project cost information. (Bell-Cornell)

PRICING IRRIGATION WATER IN IRAN,
Utah State Univ., Logan. Dept. of Economics.
B. D. Gardner, Y. Madhi, S. Partovi, H. Morteza, and S. Mehdi.
Water Resources Research, Vol 10, No 6, p 1080-1084, December 1974. 2 fig, 3 equ, 1 ref.

Descriptors: *Irrigation water, *Pricing, *Water supply, Water utilization, Management, Projects, Costs, Reimbursable costs, Water delivery, Operation and maintenance, Mathematical models.
Identifiers: *Iran.

Since its 1968 nationalization of water supplies, Iran has had the problem of setting prices for all water uses. Iran's institutional framework is described, and a pricing model for determining water charges is developed. A system is developed for pricing irrigation water delivered fo farmers from large multipurpose projects that are managed by water authorities directed to cover costs but make no profits. An irrigation project is divided into zones, and a single price is proposed for each zone. Operation and maintenance costs are set as a lower limit on price, and a certain fraction of ability to pay is set as an upper limit. Zones are ranked by assigned reimbursable costs, and a system is proposed that would produce water revenues in aggregate equal to total project reimbursable costs. For those zones where water is priced above reimbursable cost the price is set at that level where the price minus reimbursable costs, as a percentage of the difference between the upper limit and reimbursable cost, is the same for all zones. For those zones where the price is below reimbursable cost, the recommended price is at the upper limit. (Bell-Cornell)

WATER UTILIZATION AND AGRICULTURAL DEVELOPMENT IN WESTERN UTTAR PRADESH,
Indian Inst. of Management, Ahmedabad.
V. K. Gupta, P. S. George, and V. R. Gaikwad.
Available from the National Technical Information Service, Springfield, Va. 22161, as AICS-4, $10.60 in paper copy, $2.25 in microfiche. India Atomic Energy Commission, Argo-Industrial Complex Study Group, Ehabha Atomic Research Center. 1971. 271 p, 5 fig, 111 tab.

Descriptors: *Agriculture, *Irrigation, *Irrigation programs, *Irrigation districts, Irrigation water, Irrigation wells, Crop production, *Water utilization.
Identifiers: *Agro-information, *India, Farmers.

The purpose was to understand the parameters related to the cropping pattern, the use of irrigation facilities, and the participation of farmers in different organizations involved in agricultural development. Information important to the understanding of these aspects was acquired by questionnaires administered to farmers in three regions, each having a different percentage irrigated crop area. Of particular interest was the degree of utilization of the State tube-well organization by the farmers in the various regions. The state tube-well system was found to be a secondary source of irrigation water to private tube-wells. Although they were higher in cost, private tube-wells were preferred because of greater mechanical reliability, and assured and timely irrigation. Forty percent of the sample farmers reported they wanted more irrigation facilities. Farmers were found to depend maily on institutionalized sources for agro-information, and failed to mention Agricultural Development Officers from the agricultural department as an information source. (Mastic-Arizona)
W75-03950

SOME SOCIO-AGRICULTURAL CHANGES AS A RESULT OF INTRODUCTION OF IRRIGATION IN A DESERT REGION,
Central Arid Zone Research Inst., Jodhpur (India).
L. P. Bharara, S. P. Malhotra, and F. C. Patwa.
Annals of Arid Zone, Vol. 13, No 1, p 1-10. March, 1974. 5 tab, 8 ref.

Descriptors: *Irrigation, *Crop production, *Social change, *Land use, *Deserts, *Arid climates, Land development, Farming equipment, Labor, Labor mobility, Arid lands, Water distribution, Adoption of practices, Cultivated lands, Farm management, Fertilizers.
Identifiers: *India(Rajasthan Canal Project.)

The introduction of irrigation in the Rajasthan Canal-desert region caused changes in such socio-agricultural areas as occupational structure, land use, land distribution patterns, size of land holding, area sown, fallow land, agricultural inputs, and labor employment. The result of these changes was the appearance of farming communities. Labor shifted from handicraft and carpentry work to cultivation and agricultural labor. Although land holding per household decreased, the percent of area sown increased as a result of irrigation. Many in the landless class gradually have become landowners creating an increase in the number of agricultural labor jobs available. Crop farming became entirely mechanized in order to compete for higher commercialized production. (Mastic-Arizona)
W75-03951

EFFECT OF SOIL TEMPERATURE ON DIRECTION OF CORN ROOT GROWTH,
Ontario Ministry of the Environment, Toronto.
J. J. Onderdonk, and J. W. Ketcheson.
Plant Soil. Vol 39, No 1, p 177-186. Illus. 1973.
Identifiers: *Corn(Field), Growth notes, Mulch, Nutrients, Root growth(Corn), *Soil temperature, Soil moisture, Absorption.

More precise effects of soil temperature on the direction of corn root growth were determined by growing seedlings in soil for short periods in growth cabinets controlled to give a range of soil temperature conditions. The angle of growth (relative to the horizontal) was found to be minimum (10) deg. at constant 17C. Above or below this temperature (10-30C), a more vertical direction occurred. Cyclic temperatures also influenced direction, with the maximum of the cycle apparently determining the angle. The duration of the maximum temperature period in a cycle necessary to initiate a direction effect was not determined, however. The significance of these findings in the field is that modifications of soil temperatures by mulches, etc. probably influence the distribution of roots in the rooting zone of soils. This in turn means that plant behavior such as moisture and nutrient uptake can be better explained or managed for maximum performance.--Copyright 1974, Biological Abstracts, Inc.

DISTRIBUTION OF HUMUS AND AVALABLE NUTRIENTS IN SOIL UNDER SOWN PASTURES IN AN ARID ENVIRONMENT,
Central Arid Zone Research Inst., Jodhpur, (India).
R. P. Dhir, and K. E. Gajbhiye.
Annals of Arid Zone, Vol. 12, No. 3 and 4, p 179-182, September/December, 1973. 1 fig, 1 tab.

Descriptors: *Humus, *Arid lands, *Fertility, *Soil tests, Pastures, Nutrients, Organic matter, Grasses, Soils, Root development.
Identifiers: *India (Jodhpur.)

As a part of a continuing study on fertility status of soils under grass, samples were taken at horizontal distances of 12.5, 25, 50, and 75 cm. from clumps of grass with 1.5 m row spacing and 12.5 and 50 cm. for 1.0 m row spacing. At each horizontal location samples were taken at depth levels of 0-20, 20-40, and 40-60 cm. Analysis of the samples for humus with row spacings of 1.5 m shows content at the 12.5 cm. distance and 0-20 cm depth to be 0.32%, decreasing to 0.26% at 75 cm. distance. The same decreasing pattern of humus content can be seen at the 20-40 and 40-60 cm depths although it is less conspicuous. This effect is even more evident in distribution of nutrients such as phosphorus and potash where content is as much as 41% and 31% higher near the plants than at the midpoint between two rows. It appears that in spite of higher nutrient uptake near the plants, organic residues are responsible for maintaining higher availability of nutrients in the vicinity of the grass clumps. (Mastic-Arizona)
W75-03958

AGRONOMIC SURVEY OF JOJOBA IN CALIFORNIA,
California Univ., Riverside. Dept. of Plant Sciences.
D. M. Yermanos.
Economic Botany, Vol. 28, No. 2, April-June, 1974. p 160-174, 1 tab, 10 fig, 12 ref.

Descriptors: *Crop production, *Semiarid climates, *Plant morphology, *Seeds, *Drought resistance, Market value, Harvesting, Chemical properties, Cultivation, Plant growth, Protiens, Amino acid, Irrigation, *California.
Identifiers: *Jojoba, Sperm whale oil, Wax.

Two possibilities are considered for the commercial production of jojoba seed: (1) harvesting the existing natural populations, and (2) establishing new cultivated stands of jojoba. The most important use suggested for jojoba is to replace sperm whale oil with the liquid wax extracted from its seed. Renewed attention is being given to this possibility since the sperm whale has been placed on the endangered species list, and the importation of this oil has been banned in the United States. Jojoba could become a viable crop for semi-arid lands if action is taken soon to plant for jojoba production. Jojoba has good marketing potential. Large seed production could be based on wild

stands for a few years while jojoba plantations are established to eventually take over all production. Action should be taken before synthetic substitutes are developed which would eliminate the potential market. (Mastic-Arizona)

RELATION OF SOYBEAN LEAF WATER POTENTIAL TO SOIL WATER POTENTIAL,
Kansas Agricultural Experiment Station, Manhattan. Evapotranspiration Lab.
R. A. Brady, W. L. Powers, L. R. Stone, and S. M. Goltz.
Agronomy Journal, Vol 66, No 6, November-December, 1974. p 795-798, 1 tab, 5 fig, 12 ref.

Descriptors: *Soil-water-plant relationships, *Soybeans, *Soil moisture, *Evaporation, *Irrigation efficiency, Soil moisture meters, Leaves, Microclimatology, Soil water.
Identifiers: *Soil water potential, Leaf water potential, Irrigation scheduling.

A study was made to determine if a relationship exists between soil water potential and soybean leaf water potential for the purpose of aiding irrigation scheduling. Leaf water potentials were measured in a pressure chamber, soil water potentials were estimated using moisture release curves, and volumetric soil moisture measurements were made with a neutron probe. Daily atmospheric evaporative demand caused an average decrease of 9 to 10 bars for leaf water potentials. Soybeam leaf water potential was responsive to changes in soil water potential during the podding as well as the vegetative stage. Although leaf water potential was not in a 1:1 ratio with soil water potential, the maximum values of the leaf water potential in early morning make an estimation of the soil water potential possible. Differences in leaf water potential between irrigated and nonirrigated soybeans were closely related to differences in soil water potential of irrigated and nonirrigated soil. (Mastic Arizona)

EFFECT OF SOIL MOISTURE REGIMES, PHOSPHORUS AND NITROGEN ON N AND P UPTAKE BY BARLEY (HORDEUM VULGARE L.),
Haryana Agricultural Univ., Hissar (India).
H. C. Sharma, and R. M. Singh.
Indian J Agric Sci 43(1): 58-61, 1973.
Identifiers: *Barley, Hordeum-vulgare, *Nitrogen, *Phosphorus, *Soil moisture, Absorption, Fertilizers.

N and P uptake by 'NP 21' barley (Hordeum vulgare L.) was studied under varying soil-moisture regimes, levels of P and N on a clay-loam soil in 1966-68 at Udaipur. Barley irrigated at 25% available soil moisture removed 53.5% N and 51.4% P more than the unirrigated crop. Application of 40 kg N/ha increased the N and P uptake by 25.5 and 19.7% over the control, whereas application of 17.5 kg P/ha increased N and P uptake by 7.8 and 5.1%, respectively.--Copyright 1974, Biological Abstracts, Inc.
W75-03991

EFFECTS OF CCC ON DROUGHT RESISTANCE OF TRITICUM AESTIVUM L AND ZEA MAYS L,
Oxford Univ. (England). Dept. of Agricultural Science.
G. A. Robertson, and H. Greenway.
Ann Bot. Vol 37, No 152, p 929-934. 1973, Illus.
Identifiers: *Ammonium chloride, *Chloride compounds, *Drought resistance(Plants), Growth rates, Leaf, Regulators, Roots, *Transpiration, Triticum-aestivum, *Wheat, *Corn(Field).

Application of CCC ((2 chloroethyl)-trimethyl ammonium chloride) to wheat and maize reduced transpiration in both soil and solution cultures. This reduction in transpiration was a result of CCC reducing leaf area and increasing the root/shoot ratio. CCC-treated plants did not increase tolerance to internal water deficits induced by osmotic shocks or desiccation. CCC did increase the drought resistance of young wheat and maize plants, but only by delaying the onset of severe internal water deficits, i.e. by drought avoidance.--Copyright 1974, Biological Abstracts, Inc.
W75-04011

EFFECT OF A KILLED SOD MULCH ON NITRATE MOVEMENT AND CORN YIELD,
Kentucky Univ., Lexington.
G. W. Thomas, R. L. Blevins, R. E. Phillips, and M. A. McMahon.
Agron J. Vol 65, No 5, p 736-739. 1973, Illus.
Identifiers: *Corn(Field), Evaporation, *Mulch, *Nitrates, Nitrogen, Poa-pratensis, Sod mulch, Soils, Loam, Soil moisture, Bluegrass sod, Fertilizers.

Corn (Zea mays L.) was planted in a Maury silt loam soil under conventional tillage and in a chemically-killed bluegrass (Poa pratensis L.) sod in 1970 and 1971 in order to determine the behavior of nitrate and the yield of corn under both cultural systems. Nitrate under both cultural treatments was sampled before and after June rainfall periods in both years. A large fraction of the nitrate was lost from the top 90 cm of soil under the killed-sod plots, whereas, no nitrate was lost from the conventionally-tilled plots. The loss of nitrate under the killed sod was attributed to 2 factors: lower evaporation from the mulched soil; and deep penetration of water and nitrate through larger pores in the wetter, mulched soil. Corn yields where N was applied tended to be higher on the killed-sod plots in a dry year (1970) and about the same in a wet year (1971). However, the no N treatment on the mulched plots had a much lower yield than did the conventionally-tilled no N treatment in the wet year of 1971. Higher N rates may be required when corn is grown in a killed sod mulch as compared to conventionally-tilled corn.--Copyright 1974, Biological Abstracts, Inc.

USE OF BLACK POLYETHYLENE MULCH TO REDUCE FLOODING EFFECTS ON TOMATO YIELDS,
Department of Agriculture, Harrow (Ontario). Research Station.
E. F. Bolton, and J. W. Aylesworth.
Can J Plant Sci. Vol 53, No 4, p 857-861. 1973, Illus.
Identifiers: *Flooding reduction, Lycopersicon-esculentum, *Mulch, Oxygen diffusion, Roots, Soil temperature, *Tomato, Crop production.

Processing tomatoes (Lycopersicon esculentum Mill.) grown expermentally under black polyethylene mulch in the field on Brookston clay soil produced 18.3 tons/ha more tomatoes than when grown without mulch during the 1966-71 period. Although this yield increase occurred each year it was most pronounced during seasons when soil flooding inflicted varying degrees of injury on the tomato crop. Soil temperature measurements in 1970 and 1971 indicated that a higher temperature regime existed under the black polyethylene, a factor associated with high yield. O2 diffusion rates were equivalent under both polyethylene and unmulched soil during periods of flooding. Greater root volume was apparently the main effect of black polyethylene mulch in producing high yields under flooded conditions.--Copyright 1974, Biological Abstracts, Inc.

THE DEVELOPMENT OF SUPPLEMENTAL WATER: RESOURCE FLEXIBILITY AND FARM MANAGEMENT OPTIONS,
Utah State Univ., Logan. Dept. of Economics.
R. Willis.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 224, $3.75 in paper copy, $2.25 in microfiche. Agricultural Economics Series 1974-2, September 1974. 43 p, 6 tab, 23 ref. OWRT C-4361(9052)(1).

Descriptors: *Farm management, *Supplemental irrigation, Investment, *Benefits, *Investment, *Project post-evaluation, Management, *Alternative water use, *Utah.
Identifiers: *Bureau of Reclamation, Projects evaluation, Supplemental water, *Management options.

The purpose has been to identify, measure, and assess the impact of pecuniary and technological external (management options) benefits that have been realized by primary beneficiaries following Bureau of Reclamation project water deliveries. Two categories, direct and indirect water and land related management options were used to evaluate the magnitude of change correlated to management options. Six Bureau of Reclamation projects and two time periods were used in the evaluation process. Results confirm the hypothesis that management options do exist. An average of about 15% of irrigated acres have been shifted to less intensive cropping practices. Each of these shifted acres required about twice as much irrigation water as previously grown crops. Net gains on irrigated acres were $14.82, $11.81, $2.39, $3.62, $13.95, and $58.78, respectively, for Emery, Vernal, Silt, Florida, Mann Creek, and Minidoka. Indirect gains have occurred in sales of storage water (about $300,000) and water values (about $200 per acre or more) that have been capitalized into land prices. These management options have had a positive impact upon individual farm family well-being. In view of the difficulties and problems encountered in project feasibility criterion and funding process, there is a need for pecuniary and technological benefit measurements. Measurement and inclusion of these benefits could be a significant input into public investment decisions.

EVALUATION OF IRRIGATION SYSTEMS IN THE SNAKE RIVER FAN, JEFFERSON COUNTY, IDAHO,
Idaho Univ., Moscow. Dept of Agricultural Engineering.
G. D. Galinato.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 237, $6.25 in paper copy, $2.25 in microfiche. Master's Thesis, May 1974. 140 p, 30 fig, 10 tab, 37 ref OWRT B-028-IDA(1) and B-033-IDA(1).

Descriptors: *Irrigation efficiency, *Irrigation systems, *Furrows, *Border irrigation, *Furrow irrigation, Drainage, Drainage systems, Deep percolation, *Surface runoff, Ponding, Infiltration, Soil moisture, Data processing, *Idaho.
Identifiers: *Snake River(Ida)

Representative fields in the Snake River Fan, Jefferson County, Idaho, were selected to measure and evaluate the water application efficiencies of two irrigation systems presently employed. Within these fields, specific furrows and border strips were chosen for description and analysis in evaluating the performance of these irrigation systems. Results of water application efficiency tests showed an average efficiency of 24 percent for border irrigation and 51 percent for furrow irrigation. Since there was no surface runoff, the water that was lost went to deep percolation. The dominant reasons for low water application efficiencies were long durations of irrigation for high intake rate soils and long irrigation runs. Water application efficiencies should be improved by redesigning the present systems, particularly by adding drainage systems to prevent ponding of excess water, and by proper attention and judgement by the irrigator during irrigation. FLUE-CURED TOBACCO YIELD AND OXYGEN CONTENT OF SOIL IN LYSIMETERS FLOODED FOR VARIOUS PERIODS,
Agricultural Research Service, Florence, S.C. Coastal Plains Soil and Water Conservation Research Center.
R. B. Campbell.
Agron J. Vol 65, No 5, p 783-786. 1973, Illus.
Identifiers: Alkaloids, Flooded crops, *Lysimeters, Nicotiana-Tabacum, Oxygen depletion(Soil), Soils, Sugars, *Tobacco, Crop production.

Tobacco (Nicotiana tabacum L. cv. 'Coker 298') plants grown in lysimeters were flooded for 0, 12, 24, 48, 96 and 120 hr to define more clearly O2-depletion rates in soil and effects of flooding on growth. The O2 content of air entrapped in soil pores was monitored with membrane-covered galvanic-type probes before, during and after a 96-hr flooding. O2 decreased from 16 to less than 4% in the soil atmosphere within 24 hr after flooding. Upon drainage, O2 increased within 48 hr to the original concentration. Growth and yield differences between the control and 12- and 24-hr flooding treatments were not significant. Flooding for longer than 48 hr significantly reduced yield to less than 40% of that of the unflooded plants. Plants were more susceptible to flood damage at the 12-leaf stage of development than at the 17-leaf stage. Reducing sugars increased from 11.8 to 14.8% and total alkaloids decreased from 1.26 to 0.76% in tobacco leaves flooded for 24 hr.--Copyright 1974, Biological Abstracts, Inc.

CROPPING PATTERNS INVOLVING RICE AND THEIR MANAGEMENT,
Rothamsted Experimental Station, Harpenden (England). Dept. of Chemistry.
P. K. R. Nair, Ambika Singh, and S. C. Modgal.
Indian J Agric Sci. Vol 43, No 1, p 70-76. 1973, Illus.
Identifiers: *Crop management, Oryza-sativa, Puddline soil, *Rice, Soils, Transplanting, Cropping patterns, Farm management.

The feasibility of including rice (Oryza sativa L.) in intensive cropping patterns was explored, and the merits of 2 soil-management systems for rice (direct seeding in unpuddled soil and transplanting in puddled soil) in such patterns was evaluated from a field experiment conducted during 1969-71. For the agronomic, economic and management aspects, it was found more desirable to avoid the puddling soil, and consequently transplanting. However, transplanting reduced the effective total crop duration of the cropping pattern by 20 days.--Copyright 1974, Biological Abstracts, Inc.

STUDIES OF TILLAGE-FERTILITY ON PEARL MILLET IN SANDY ARID PLAINS OF RAJASTHAN,
Central Arid Zone Research Institute, Jodhpur (India).
S. D. Singh, R. C. Singh, D. L. Vyas, D. K. Misra, and N. S. Bhati.
Annals of Arid Zone, Vol 12, No 3 and 4, September/December, 1973. p 145-154, 2 fig, 7 tab, 8 refs.

Descriptors: *Cultivation, *Fertilization, *Crop production, *Arid lands, *Plant growth, Fertilizers, Nitrogen, Farm wastes, Dry farming, Rainfall, Emerging vegetation stage, Germination.
Identifiers: Pearl millet.

This study was undertaken to determine the best method of tillage in relation to nitrogen levels for pearl millet grown under natural rainfall conditions in the sandy arid soils of Rajasthan. Five methods of tillage were tried in addition ot fertilizer treatments with farm manure and ammonium sulfate. Tillage methods consisted of plough-plant, 1-ploughing by country plough, 2-ploughing by country plough, 1-harrowing, and 1-harrowing plus 1-ploughing by country plough. No significant differences in seedling emergence was observed due to any of the treatments, but germination on the plough-planted plot was slightly lower. Soil in the plough-planted plot was found to be more porous than in the other methods. Application of ammonium sulfate gave better yields than the organic source on an equal nitrogen basis. The minimum rate of nitrogen advocated for dryland farming was 10 kg. per hectare. (Mastic-Arizona)

PRELIMINARY STUDY ON MOVEMENT OF AVAILABLE WATER IN SANDY LOAM SOILS UNDER DRY FARMING CONDITIONS,
Gujarat Soil Conservation Research, Demonstration and Training Centre, Vasad (India).
R. Dayal, A. Singh, and N. H. Saraf.
Annals of Arid Zone, Vol 12, No 3 and 4, September-December, 1973. p 172-178, 5 tab, 2 fig.

Descriptors: *Rainfall, *Root zone, *Plant growth, *Moisture availability, *Water utilization, *Dry land farming, Soil water movement, Evapotranspiration, Crops, Loam, Evaporation, Soil surface, Semi arid climates, Reclamation(Soil), Tobacco.
Identifiers: Vasad(Gujarat).

Planting during the early stages of rainfall provides better moisture availability and utilization during crop growth. Late planting has shown that there is a deficit of moisture in the effective root zone at the later crop growth stages which causes low yields. Availability of water from the major root depth (0-90 cm.) can only be insured with early planting. The evapotranspiration ration increases with late planting showing that loss of conserved moisture by evaporation from the soil surface increases with the delay in planting. Planting in July in the semi-arid area of Vasad would take advantage of rain water availability. (Mastic-Arizona)

IRRIGATION'S IMPACT ON SOCIETY.
Arizona Univ., Tucson. Dept. of Anthropology.
University of Arizona Press, Tucson. 1974. 181 p, 34 fig, 285 ref. University of Arizona, Anthropological Papers, no. 25. T. E. Downing and M. Gibson, eds.

Descriptors: *Irrigation systems, *Social impact, *History, *Archaeology, Agriculture, Irrigation design, Canals, Flow, Flood irrigation, Salinity, Conveyance structures, Fallowing, Water management(Applied), Southwest US, Mexico, Deserts, Spatial distribution.
Identifiers: *Irrigated agriculture, Peru, Iran, Mesopotamia, Middle East.

These papers were prepared for a 1972 symposium on the relationship of irrigation to society, with the emphasis on the problem of relating the complexity of social organization to the complexity of water-control problems. Despite the diversity of disciplines represented by the participants, certain themes emerge: Notions of cycles, the discovery of relevant elements of the physical irrigation system, comparable water-control solutions by unrelated cultures, a tendency toward contralization spawned by scarcity, and finally a recognition of the need for anthropologists/archaeologists to delve more deeply into the fields of the geographer/hydrologist. Individual papers cover in considerable detail such topics as historic patterns of Mesopotamian irrigation agriculture, organizational preadaptation to irrigation, irrigation and steelement patterns, conservation and diversion, irrigation development and population pressure, the State's use of irrigation in changing peasant societies; and others that are addressed particularly to Peru's coastal deserts; a case of irrigation, conflict, and politics in Mexico; and a water-control system practiced by prehistoric peoples of the American southwest. The papers proceed from a consideration of natural factors, including population, to view irrigation as yet another means for adapting to a specific environment. (Paylore-Arizona)

CORN ROOT-CONFIGURATION RESPONSE TO SOIL TEMPERATURE AND MATRIC SUCTION,
Agricultural Research Service, Pendleton, Oreg. Columbia Plateau Conservation Research Center.
R. R. Allmaras, and W. W. Nelson.
Agron J. Vol 65 No 5, p 725-730. 1973, Illus.
Identifiers: *Corn(Field), Matric suction, Moisture, Mulch, Residues, *Roots, *Soil temperature, Straw, Tillage.

Soil temperature and water variables imposed on the roots of corn (Zea mays L.) in field plots influenced root development. Responses were measured in separate portions of the root system where adventitious roots initiate and subsequent root elongation and branching occurs. These portions of the corn root system are separated far enough to permit specific field management for each portion. Temperature and water variables were produced by combinations of straw-mulch strips and interrow tillage. Initiation of adventitious roots in the 0- to 10-cm soil depth was dominantly influenced by soil temperature in the row. In soil depths below 10 cm, a functional relation between root configuration and the interrow-minus-row soil temperature, and matric suction described the elongation and branching responses subsequent to root initiation. In the year of lower soil temperature and higher moisture (measurements were made in 2 growing seasons), higher interrow temperatures stimulated branching and elongation, but in the year of higher soil temperature and moderate moisture conditions, responses to temperature were negligible. Higher interrow moisture, stimulated branching and elongation in both years as long as the average matric suction was greater than about 85 mb. These explicit descriptions of corn-root-configuration response show the importance of soil temperature management in the row and water management in the interrow. This approach permits more extensive use of the row-interrow concept for design of minimum tillage and residue management systems.--Copyright 1974, Biological Abstracts, Inc.

PERFORMANCE OF SULFURCOATED UREA UNDER INTERMITTENTLY FLOODED RICE CULTURE IN PERU,
North Carolina State Univ., Raleigh. Coleander National Rice Program Peru.
P. A. Sanchez, A. Gavidiao, G. E. Ramirez, R. Vergara, and F. Minguillo.
Soil Sci Soc Am Proc. Vol 37, No 5, p 789-792. 1973, Illus.
Identifiers: *Fertilizers, Flooded crops, Grains, Growth rates, Crop management, Nitrogen, Oryza-Sativa, Performance, *Peru, *Rice, Sulfur, *Urea(Sulfurcoated), Vegetation, Crop production, Absorption.

Short-statured, high yielding rice (Oryza sativa L.) varieties grown extensively in northern Peru require extremely high rates of conventional N sources to achieve maximum yields. The recovery of applied N is extremely low due to the use of intermittent flooding. This water management system results in heavy N losses even with properly timed split applications. In search of simpler and more efficient methods of N management, 8 field experiments were conducted in the region to evaluate S-coated urea (SCU), an experimental, slow-release N source supplied by the Tennessee Valley Authority. Rice yields were increased an average of 59% more by pretransplant-incorporated SCU than by urea or (NH4)2SO4 applied in the same manner. SCU produced an average of 20% higher grain yield response than topdressed applications of urea or (NH4)2SO4. SCU applications increased panicle production, N uptake at harvest, and the apparent recovery of added N. Beneficial effects of SCU were more pronounced in sites where check yields were low, especially less than about 4.8 ton/ha. In sites with high N supplying capacity, SCU produced excessive vegetative growth which resulted in yield reductions at high N rates. Regardless of an assumed 48%-higher unit N cost in SCU, the overall benefits of pretransplant-incorporated applications of SCU were favorable since there was a decrease of 40% in the optimum rate of N and the need for precise timing of application was eliminated.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF LEVEL TERRACES ON SOIL MOISTURE CONTENT AND UTILIZATION BY CORN,
Iowa State Univ., Ames.
E. L. Miller, and W. D. Shrader.
Agron J. Vol 65, No 4, p 600-603. 1973, Illus.
Identifiers: *Corn(Field), Nitrogen, Phosphorus, *Soil moisture, *Terraces, Soil density, Crop production, *Fertilizers, *Iowa.

Field experiments were conducted to determine the effect of sod-stabilized backslope level terraces on soil moisture content and the utilization of moisture by corn (Zea mays L.). Plots were located in the terrace interval and in terrace channel positions up-slope from 9 different terraces, on a watershed, in the Ida-Monona soil association area of southwestern Iowa. Periodic measurement of soil moisture in the root zone, daily observation of weather variables, and corn development and yield measurements were made for each plot and were used to evaluate soil moisture content and utilization by corn. Soil moisture amounts in the rooting zone were greater in terrace channels than in terrace interval positions on all sample dates, with differences ranging 1.98-6.27 surface cm and averaging 5 cm in the surface 1.83 m of soil. Significant yield differences between positions occurred, and moisture-stress intensity was a significant factor in explaining yield variations. Other factors that were significant in explaining the variation in yield were plant density and plant N and P contents. A yield-response curve was developed, which characterized the relationship between corn yield and moisture stress intensity.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF TRACTOR TRAFFIC, SURFACE MULCH AND SEEDBED CONFIGURATION ON SOIL PROPERTIES,
Agricultural Research Service, Big Spring, Tex.
P. T. Koshi, and D. W. Fryrear.
Soil Sci Soc Am Proc. Vol 37, No 5, p 759-762. 1973, Illus.
Identifiers: Bulk, Conductivity, Gossypium-Hirsutum, Hydraulics, *Mulch, Organic matter, Porosity, *Seedbed configuration, *Soil properties, Surface, *Tractor traffic, *Texas(Southern High Plains), *Cotton, *Sandy soils, Soil density, Soil compaction.

The effects of 3 seedbed configurations, 4 mulch rates, and tractor traffic confinement on soil properties that affect soil-water relations of a sandy soil were tested with cotton as a test crop. The lack of water limits crop production on dryland sandy soils in the Southern High Plains. Undisturbed soil cores were taken from the 0-7.5, 7.5-15-, and 22.5- to 30-cm depths in the trafficked and nontrafficked interrows and crop rows of the flat, ridge and furrow treatments. Surface mulch rates of 0, 5.6, 11.2 and 22.4 tons/ha of cotton-bur mulch were applied annually after seedbed preparation to each split plot. Tractor traffic was confined to the same path each year using cotton (Gossypium hirsutum L.) as a test crop. Mulching at rates more than 11.2 tons/ha reduced the bulk density, increased hydraulic conductivity, air porosity, total porosity, and organic matter content even in the trafficked interrows. Hydraulic conductivity of the crop rows increased 8-fold with heavy mulch applications. Hydraulic conductivity increased 3-fold, bulk density was reduced, and air porosity increased as a result of controlling tractor traffic even without mulch.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF MOISTURE REGIMES AND GREEN MANURING ON FERROUS IRON CONCENTRATION IN SOIL AND GROWTH AND YIELD OF PADDY,
Illinois Univ., Urbana.
I. K. Jaggi, and M. B. Russel
J Indian Soc Soil Sci. Vol 21, No 1, p 71-76. 1973, Illus.
Identifiers: *Ferrous iron, Flooding, Growth rates, Moisture content, Organic matter, Paddy, Soil moisture, *Crop production, *Farm wastes, Fertilizers, *India, *Clay loam.

In the 1970 kharif season, a field experiment was conducted on a clay loam soil of Jabalpur, Madhya Pradesh, India, to determine the state of oxidation of paddy soil and the yield of paddy under 2 water levels and 2 levels of added organic matter. Water level was maintained 5 cm above and 10 cm below the soil surface in 3.6 m x 3.6 m plots. Split treatments of no added organic matter and of 18000 kg/ha (dry weight) green Ipomoea were applied to each water level treatment. The concentration of ferrous Fe in the 0-5 cm surface soil receiving organic matter and surface flooding attained its maximum limit of 200 ppm after 6 weeks of flooding and then declined to 1000 ppm. These concentrations were 10-20 times higher than those measured in the other 3 treatments. Average paddy yields were 69, 54, 68 and 64 quintals/ha for the flooded plots without and with organic matter, respectively. None of the treatments significantly influenced the weight of roots per unit volume of soil at depths of 0-10, 10-17.5 and 17.5-25 cm.--Copyright 1974, Biological Abstracts, Inc.

ISOLATED SOIL COLUMNS FOR PLANT RESEARCH: PROCEDURE AND UNIFORMITY TRIAL,
Agricultural Research Service, Logan, Utah.
W. Keller, A. T. Bleak, and A. C. Hull, Jr.
Agron J. Vol 65, No 5, p 720-722. 1973, Illus.
Identifiers: Hordeum-Vulgare, Lysimeters, *Precipitation(Atmospheric), Procedures, *Soil columns, *Barley, Uniformity trials, *Crop production.

Isolated soil columns offer one means of studying the influence on yield and other plant characteristics of different amounts of precipitation while other environmental factors are unaltered. These columns may be regarded as an inexpensive substitute for lysimeters. This study describes the establishment of 67 columns 1.22 m2 in a single row in 1967 and 79 and 88 columns in adjacent rows in 1969. The 1st year after establishment, a uniform crop of barley (Hordeum vulgare L.) was grown on the isolated columns as well as on 2 opposite sides. Coefficients of variation for total yield of barley ranged 8.17-11.42%. A brief description is given of catchments to increase precipitation on the plots by 50% or to reduce it by 33%. These catchments are being used in studies with perennial forage species.--Copyright 1974, Biological Abstracts, Inc.

EFFECT OF STORED SOIL MOISTURE RESERVE THROUGH CONSERVATION PRACTICES AND SUPPLEMENTAL IRRIGATION ON WHEAT YIELD UNDER DRYLAND FARMING CONDITION,
Indian Agricultural Research Inst., New Delhi (India).
C. R. Hazra, S. B. Ray, and T. D. Biswas.
J Indian Soc Soil Sci. Vol 21, No 1, p 9-22, 1973, Illus.
Identifiers: Bulk, Density, *Dryland farming, Farming, *Irrigation(Supplemental), Mulch, *Soil moisture, Straw, *Wheat yield, *Mulches, Infiltration, Moisture conservation(Soils), *India.

The surface configuration treatments for better infiltration of rain water during the kharif (rainy) season were effective in checking runoff and causing higher water infiltration. Moisture conservation was greatly increased with the application of mulches on the soil surface. The mulches (polyethylene sheet and wheat straw) reduced evaporation from the soil, improving the soil moisture status at the sowing time of wheat in the rabi (dry) season; that consequently increased seedling emergence. Soil bulk density decreased while organic C content of the soil and infiltration of water into soil increased under both the mulches (polyethylene and straw). Surface configuration treatments did not have much effect on the yield of wheat while mulches significantly improved the yield. Supplemental irrigation treatments improved grain yield. Positive interaction effect was observed between mulches and supplemental irrigations on grain yield during the dry growing season.--Copyright 1974, Biological Abstracts, Inc.

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

METHODOLOGIES FOR OPERATING RESERVOIRS FOR SHORT-TERM FLOOD CONTROL.
Cornell Univ., Ithaca, N.Y. Dept. of Operations Research.
J. R. Fergusson.

Available from the National Technical Information Service, Springfield, Va 22161, as PB-239 108, $9.50 in paper copy, $2.25 in microfiche. Technical Report No 85, Cornell University Water Resources and Marine Sciences Center, Ithaca, New York, September 1974. 334 p, 22 fig, 8 tab, 83 ref. OWRT C-5240(No 4230)(1). 14-31-0001-4230.

Descriptors: *Reservoir releases, *Flood control, *Methodology, *Linear programming, *Optimization, *Scheduling, Reservoir operation, Damages, Costs, Water resources, River systems, Management, Constraints, Mathematical models, Systems analysis.

The task of scheduling releases from reservoirs in a river system during a flood so as to minimize total damage is examined from the perspective of mathematical modelling. The problem is formulated using separable programming, involving the minimization of piecewise-linear damage functions which are generally nonconvex and possibly discontinuous, subject to linear constraints. Some analytic properties of this model are given, including solution charact_rizations for two simple reservoir system structures. Due to the difficulty of extending these results, it is concluded that numerical solution techniques are required. These are developed in detail in a general setting, so that they apply to arbitrary separable programming problems with linear constraints. Initially, cost function continuity is assumed; this is later relaxed to assume discontiunities. The resulting methods are thus applicable to most separable programming problems arising in practice, including the short term flood control reservoir operating problems. Benders' decomposition techniques are also developed for problems in which a subset of the cost functions are convex. Based on a limited amount of computation experience, it is tentatively concluded that lower convex approximation is the best of the above methods when cost functions are nearly convex, while the one based on monotonicity is preferable when they are nearly concave. IRRIGATION DITCH LINER AND METHOD FOR MAKING SAME,
H. Nienstadt.
US Patent No 3,854,292, 3 p, 8 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 945, December 17, 1974.

Descriptors: *Patents, *Irrigation ditches, *Water distributions(Applied), Ditches, Resins, Plastics, *Linings, Protective coatings.
Identifiers: Glass fiber reinforced plastic, Polyester, *Channel liners, Prefabricated liners.

Liner sections are prefabricated with glass fiber reinforced plastic resin, preferably polyester. The glass fiber is in the form of a mat having fibers in random orientation, and more or less felted together. Different types of polyester may be used in accordance with the temperature and ground conditions, and the characteristics may be tailored throughout the length of the ditch or channel to have different characteristics at different portions. In particular, flexible or semi-flexible sections are provided every so often to take up for thermal expansion and contraction and for use in areas where the ground is likely to shift somewhat. Furthermore, in areas which are likely to be dry from time to time, fire resistant or retardant polyester or other resins may be used. Each prefabricated section, which may be many feet in length, and from approximately 1/8 inch thickness on up, has at the opposite ends thereof a section of glass fiber mat, for example on the order of 4 to 6 inches, which is not covered with resin. Liquid resin is coated on the previously uncoated fiber at the end of each section during installation, and the mats from one prefabricated section to another are overlapped. When the fresh resin sets up, a continuous channel liner is provided. (Sinha-OEIS)

EVALUATION OF INTERREGIONAL INPUT-OUTPUT MODELS FOR POTENTIAL USE IN THE MCCLELLAN-KERR ARKANSAS RIVER MULTIPLE PURPOSE PROJECT IMPACT STUDY,
Catholic Univ. of America, Washington, D.C. Inst. of Social and Behavioral Research.
U. Kim.
IWR Contract Report 74-6, submitted to U.S. Army Engineer Institute for Water Resources, Fort Belvoir, Va., Aug 1974. 99 p, 11 map, 4 tab, 80 ref. DACW 31-72-C-0059.

Descriptors: *Evaluation, *Input-output analysis, *Multiple-purpose projects, *Model studies, Industries, Economics, *Data collections, *Regional analysis, Measurement, Surveys, Investment, Bibliographies, Equations, Systems analysis.
Identifiers: *Impact studies, *Arkansas River Project, Trade, Long-range impact, Impact assessment, Interregional.

A number of operational multi-regional and single region input-output models are evaluated, and an empirically feasible, theoretically sound model is recommended for impact analysis of the Arkansas River project. First, some theoretical aspects of input-output (I/O) analysis are surveyed. A national model is explained through its structural, balance, and solutions equations. Discussed are a regional and an interregional model, Moses' model, Leontief's intranational model, a 'gravity' model, and linear programming and dynamic models. Next, four empirical works of interregional I/O studies are investigated, including the Harvard Study. The use is suggested of a modified revision of the Harvard University Multi-region Input-Output Model completed for the Economic Development Administration. To measure the project's impact on both industrial and regional interdependencies and to comprehend feedback effects, the construction is proposed of an interregional I/O model closed on national boundary. The proposed model is particularly effective in measuring both the direct and indirect impact a given change in demand would have upon the various industrial sectors in a region; it would measure impact on neighboring regions as well as on its own. The remainder of the report is devoted to a data collection plan for the interregional I/O model. (Bell-Cornell)

EVALUATING MULTIRESERVOIR OPERATING RULES,
Ecole Polytechnique, Montreal (Quebec).
J. M. Mejia, P. Egli, and A. Leclerc.
Water Resources Research, Vol 10, No 6, p 1090-1098, December 1974. 8 fig, 1 tab, 16 equ, 4 ref.

Descriptors: *Reservoir operation, *Recreation, *Flow augmentation, *River systems, *Evaluation, Optimization, Simulation analysis, Linear programming, Hydrologic data, River basins, Hydrologic systems, Assessment, Multiple purpose, Water allocation(Policy), Summer, Lakes, Estimating, Constraints, Reservoir storage, Drawdown, Equations, Mathematical models, Systems analysis, Flow, Forecasting.
Identifiers: *Operating rules, Decision rules, Historical data, North River System(Canada), Effectiveness, Socioeconomic effects.

Decision rules for operating a multiobjective multireservoir system are evaluated. The effectiveness of alternative operating rules in meeting specified objectives is assessed for the North River system, located near Montreal, Quebec. The North River is regulated by an existing system of reservoirs for recreational and flow augmentation purposes. These objectives are translated into a set of criteria that makes the problem amenable to mathematical optimization, the emphasis then being on the utilization of hydrologic information and the incorporation of optimization procedures in four progressively more complex operating rules. The socioeconomic effects of the operating rules are estimated separately for each of the two uses, thereby establishing a basis for a subjective final evaluation. The rules range from the so-called standard policy to a policy incorporating multiple-period flow forecasting and sequential linear programming for determining the optimal allocation of the available water in space and time. Historical data are used to simulate the operation of the system under the different rules, and an assessment of the policies is made on the basis of multiobjective criteria. For the conditions of the North River reservoir system, the operation problem can be constrained and formulated so as to justify the incorporation of relatively simple optimization procedures in alternative operating rules. CHANCE-CONSTRAINED DYNAMIC PROGRAMING AND THE OPTIMIZATION OF WATER RESOURCE SYSTEMS,
New South Wales Univ., Kensington (Australia).
A. J. Askew.
Water Resources Research, Vol 10, No 6, p 1099-1106, December 1974. 3 fig, 2 tab, 20 equ, 6 ref.

Descriptors: Water resources, *Dynamic programming, *Stochastic processes, *Probability, *Constraints, *Reservoir operation, *Reservoir releases, Optimization, Evaluation, Estimating, Economic efficiency, Annual, Costs, Benefits, Algorithms, Equations, Mathematical models, Systems analysis.
Identifiers: System failure, Chance-constrained programming, Operating policy, Benefit maximization.

To limit the probability of failure of a water resource system when it is operated in accordance with its optimum operating policy, such policy must be derived subject to relevant chance constraints. Using a stochastic dynamic program, certain of these constraints can be handled similarly to deterministic constraints, whereas others can be applied indirectly by imposing a penalty for failure, the optimum value of which can be found by an interative search. This search and a precise evaluation of the response of the system may be achieved within the dynamic program by means of minor additions to its basic algorithm. Application of this procedure to four single reservoir systems releasing water to meet a single demand domonstrates its suitability for deriving optimum operating policies for water resource systems and for estimating their response to given inputs and contraints. The object is usually benefit maximization (net), implying, among other things, that long-term economic efficiency is the only criterion on which to judge the significance of system failure. However, if the target release from a reservoir cannot be met, the socio-political implications of this failure may far outweigh any economic evaluation of the gravity of the situation. (Bell-Cornell)

OPTIMIZATION OF REAL TIME OPERATION OF A MULTIPLE-RESERVOIR SYSTEM,
California Univ., Los Angeles. Dept. of Engineering Systems.

L. Becker, and W. W-G. Yeh.
Water Resources Research, Vol 10, No 6, p 1107-1112, December 1974. 2 fig, 2 tab, 16 ref.

Descriptors: Water resources, *Reservoir operation, *Reservoir releases, *Linear programming, *Dynamic programming, Methodology, *Optimization, Reservoir storage, Inflow, Hydroelectric plants, Streamflow, Constraints, Algorithms, Computers, California, Water supply, Mathematical models, Systems analysis.
Identifiers: Real time, Operating rules, Policy period.

Presented is an optimization procedure for real time multiple-reservoir operation. The methodology is used to determine optimal operating rules for an existing multiple-reservoir and hydroelectric facility associated with the Shasta and Trinity subsystems of the California Central Valley Project. The problem is to derive the optimum release policy over the specified release periods, which will result in a set of ending storages in the final policy period that is known to be adequate for future system operation. The optimization criterion for each period is to operate so as to minimize the potential energy loss resulting from releases of stored water for various uses. The methodology uses a form of dynamic programming for the selection of an optimal reservoir storage policy path through the specified number of policy periods and a linear programming routine for period by period optimization. The policy periods, in case of real time operation, correspond to the number of time periods for which a streamflow prediction model is reasonably reliable. The method results in relatively easy computer implementation and high flexibility in that changes in constraints are simply made and additional reservoirs easily added. The method is of considerable value for determining release policies in real time operation of an existing system. (Bell-Cornell)

TWO-DIMENSIONAL DISPLACEMENT INTO OR FROM WATER-FILLED DITCHES,
Arizona Univ., Tucson, Dept. of Soils, Water, and Engineering.
S. Miyamoto, and A. W. Warrack.
Soil Science Society of America, Proceedings, Vol. 38, No. 5, September-October, 1974. p 723-727, 1 tab, 5 fig, 11 ref.

Descriptors: *Ditches, *Saturated flow, *Spoil banks, *Drainage water, *Flow characteristics, Salts, Leaching, Fertilizers, Drainage engineering.

Piston-type displacement of solutes for steady-state saturated flow into or from water filled ditches is analyzed mathematically and by a sand tank method. The displacement front into the drains advances much faster near the drains than in the region midway between them. A spoil bank may be useful in reducing the amount of water needed to leach salts or in minimizing the loss of water applied fertilizers into drains. The displacement front for water moving from ditches into a field advances in an ellipsoidal pattern. Data obtained from the sand tank model agreed with the predicted fronts. (Mastic-Arizona)

HYDROLOGIC ANALYSIS OF THE MOJAVE RIVER, CALIFORNIA, USING A MATHEMATICAL MODEL,
Geological Survey, Menlo Park, Calif.
T. J. Durbin, and W. F. Hardt.
Water-Resources Investigations 17-74, November 1974. 50 p, 18 fig, 7 tab, 42 ref.

Descriptors: *Mathematical models, *Rivers, *California, *Water conveyance, Surface-groundwater relationships, *Water importing, Water loss, Infiltration, Analog models, Artificial recharge, Open channel flow.
Identifiers: *Mojave River(Calif), *Barstow(Calif).

A mathematical model predicts the effects of using the normally dry Mojave River, California, as a natural conduit system to convey imported water about 60 miles downstream to Barstow. The imported water would be used to replenish aquifers now being overpumped. From 1930 to 1972 only 18 floods at The Forks (headwaters of the Mojave River basin) produced flow at Barstow. The mathematical model simulates the flow characteristics down the initially dry channel and evaluates the potential of the channel to move water to Barstow. Results of simulation by modeling indicate that the channel of the Mojave River can be used efficiently to convey imported water to Barstow only when the absorption capacity of the channel has been reduced by an antecedent flood. An electric analog model was also utilized to predict water-level effects from potential recharge to the underground west of Barstow. (Knapp-USGS)

USEFULNESS OF ERTS-1 AND SUPPORTING AIRCRAFT DATA FOR MONITORING PLANT DEVELOPMENT AND RANGE CONDITIONS IN CALIFORNIA'S ANNUAL GRASSLAND,
California Univ., Berkeley. School of Forestry and Conservation.
D. M. Carneggie, S. D. Degloria, and R. N. Colwell.
Final Report to U.S. Department of the Interior, Bureau of Land Management, March 31, 1974. 53 p, 12 fig, 2 tab, 8 ref.

Descriptors: *Grasslands, *Remote sensing, *Aerial photography, *Range management, *Climatic data, *Spectrophotometry, Grazing, Forages, Crop production, Plant growth, Range grasses, Phenology, Reflectance, *California.
Identifiers: *Earth Resources Technology Satellite(ERTS-1) Wildfire.

The purpose was to determine if ERTS-1 imagery and supporting aircraft photography can: monitor growth and development in the annual grasslands of California, determine the relative amount of forage produced for a given area between years, and provide inputs for a model predicting forage condition and production using ground, spectroradiometric, and climatic data. The results showed a close correspondence between spectral reflectance ratios and green biomass. Changes in ground spectral reflectance data also correspond with observed changes in growth stage and condition of the forage species. Relative differences in forage production were also indicated by ERTS spectral radiance data. Repetitive sequences of ERTS color composite images can provide the means for monitoring change in condition and comparison of condition of different range areas. Anticipated benefits from ERTS monitoring includes: better planning for movement of grazing animals, estimating length of green feed periods for ranges enabling planning for alternative feed sources, determination of dry forage fire hazards, and assessing range conditions as a result of climatic conditions, whether drought or forage abundance. THE ULTRASONIC METHOD OF RIVER GAUGING,
Department of the Environment, Reading (England). Water Data Unit.
R. W. Herschy.
Water Services, Vol 78, No 940, p 198-200, June, 1974. 3 fig.

Descriptors: *Flow, *River flow, Rivers, Gaging Networks, Gaging stations, Ultrasonics.
Identifiers: River gauging, *Ultrasonic methods Great Britain.

The ultrasonic method of river gauging was designed to more accurately measure river flow in areas, where existing methods of river gauging are unsuitable, such as rivers influenced by navigation and locks. The ultrasonic method measures the velocity of flow at a certain depth by simultaneously transmitting sound pulses through the water from transducers on both sides of the river. The average velocity of the water at the depth of the transducers is directly related to the difference between the time of travel of the pulses crosing the river in an upstream direction and those travelling downstream. By incorporating an area factor in the electronic processor and relating the average velocity at the depth of the transducers to the average velocity of flow of the whole cross section, an output of discharge can be determined. Studies were done at River Pang at Pangbourne and at the River Thames at Sutton Courtenay and

the calibration and accuracy f the system were determined. (OrriFIRL)

AMBIENT CURRENT EFFECTS ON VERTICAL SELECTIVE WITHDRAWAL IN A TWO LAYER SYSTEM,
Oregon State Univ., Corvallis. Ocean Engineering Programs.
L. S. Slotta, and R. J. Charbeneau.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 234, $3.25 in paper copy, $2.25 in microfiche. Completion Report, Oregon Water Resources Research Institute, Corvallis, January 1975. 15 p, 7 fig, 1 tab, 17 ref. OWRT A-025-ORE(1).

Descriptors: *Withdrawal, *Gravity waves, Flow, Reservoir releases.
Identifiers: Interfacial gravity waves, Separating height, *Ambient current effects, *Two layer systems, *Selective withdrawal.

The study examined the way in which the selectivity of flow withdrawal into a vertically suspended, upper strata point sink is affected by an ambient current in a two layer system. The results show that an ambient current will influence the selectivity of a withdrawal flow, though the magnitude of the influence is small and is partially masked by the generation of interfacial gravity waves. If such waves can be excluded, then an ambient current would be expected to enhance the phenomenon of selective withdrawal. The generation of interfacial waves may be a more important consequence of an ambient current than its influence on the degree of selectivity; especially as the interfacial waves relate to the subsequent structure of the flow field. The results also show that within a range of separating heights of the intake from the interface, the degree of selectivity is a quasi-linear function of the separating height. Of special interest is the observation that the defined degree of selectivity approaches unity slowly after passing a critical value of the separating height. The influence of the density difference across the interfacial region is negligible when the intake is close to the density-interface, but increases in importance as the separating height is increased.

SPECIAL FLOOD HAZARD INFORMATION REPORT: YOCKANOOKANY RIVER, DYE DITCH AND MUNSON CREEK, KOSCIUSKO, ATTALA COUNTY, MISSISSIPPI.
Army Engineer District, Mobile, Ala.
Prepared for Mississippi Research and Development Center, May, 1972, 14 p, 4 fig, 3 tab, 9 plates.

Descriptors: *Yockanookany River(Miss), *Dye Ditch(Miss), *Munson Creek(Miss), Kosciusko(Miss), Attala County(Miss).
Identifiers: *Floods, *Flooding, *Flood control, *Flood protection, *Flood plains, Channel improvement, Mississippi.

Yockanookany River, approximately 55 miles long and 9 miles wide, and two of its tributaries, Munson Creek and Dye Ditch, have a total drainage area of 453.5 square miles. Munson Creek enters the river about a mile east of Kosciusko, a diverse agricultural center of 7,000 with a few industries. Dye Ditch flows from the west into the river about one mile south of the city. Timber and agricultural land in the river's flat wide flood plain is slowly beginning to be developed. Little development exists on Munson Creek's flood plain. Along Dye Ditch are a few residences, several commercial and light industrial firms. Flood producing frontal type storms lasting 2 to 4 days are most numerous in winter and spring. Summer thunderstorms with high intensities over small areas cause flash flooding. All three streams are spanned 19 times by bridges and culverts which impede flood flow. Except for earlier canalization projects which contributed silt and debris to overgrown banks, no flood damage reduction project exists and the bankfull stage of 10 feet has been exceeded a number of times. Largest flood, March 29, 1951, crested at 18.72 feet. Most recent flood, May 16, 1968, resulted from flash flooding following 4.2 inches of rain in less than 2 hours and did not cause high flood stages on the river. An Intermediate Regional Flood would be 3 to 4 feet higher than the 1951 flood inundating an estimated 5,500 acres, including residential and commercial sections, roads, and public and private utilities. A Greater Probable Flood (with an average frequency of occurrence of once in 500 years although it may occur in any year) probably inundating about 6,000 acres, would be 6 feet above the 1951 flood. (Salzman-North Carolina)

FLOOD PLAIN INFORMATION: JORDAN RIVER COMPLEX II, MIDVALE-DRAPER, UTAH.
Army Engineer District, Sacramento, Calif.
Prepared for the Utah Division of Water Resources and Salt Lake County, March 1974. 38 p, 17 fig, 8 tab, 28 plates.

Descriptors: *Flood plains, *Flood damage, *Flood forecasting, Flood profiles, Flood data, Obstruction to flow, Land use, Planning, Urbanization, Flood plain zoning, Utah, Dams, Cloudbursts.
Identifiers: *Jordan River(Utah), *Midvale(Utah), Dry Creek(Utah), Willow Creek(Utah), Corner Canyon Creek(Utah), Flood plain management, Standard Project Flood, Intermediate Regional Flood, Wasatch Range, Utah Lake.

This report can serve as a basis to guide land development toward optimum uses commensurate with flood hazard. The 3 creeks, which rise at high elevations in the Wasatch Range and flow westerly to the valley floor and their termini at Jordan River, are intermittent streams and normally flow only during snowmelt season. Although there are a number of urban centers in the study area, Midvale being the largest, the area is not extensively urbanized. Due to the conversion of agricultural land to urban-suburban uses as families migrate from Provo and Salt Lake City to smaller towns, agricultural activities are expected to continue at slightly reduced levels. Floodflows are produced by early season cloudburst storms over tributary drainages and by snowmelt from high temperatures in late May and early June which cause floods with a slow rate of rise and extended out-of-bank period. The most severe flood was of this type in May 1952; a flood this size would have a frequency of occurrence of about once in 50 years. An Intermediate Regional Flood (IRF) on the Jordan River at Jordan Narrows would produce a peak discharge of 1800 cfs and a Standard Project Flood (SPF) at the same point would produce 2200 cfs. In the study area, there are 50 obstructive bridges, culverts, diversion weirs and other stream crossings. There are no flood control structures per se affecting the study reach. However, Utah Lake affords some incidental reduction of flood flows, there is a flood detention dam on Dry Creek, and an ordinance providing for floodway zones is being developed. (Diefendorf-North Carolina)

FLOOD PLAIN INFORMATION: CHOCTAWHATCHEE RIVER, PEA RIVER, DOUBLE BRIDGES CREEK, CITY OF GENEVA, ALABAMA.
Army Engineer District, Mobile, Ala.
June 1973. 28 p, 16 fig, 8 tab, 17 plates.

Descriptors: *Flood forecasting, *Flood control, *Floodplain zoning, *Flood profiles, *Historic floods, *Levees, Flood stages, Flood data, Obstruction to flow, Land use, Planning, Alabama.
Identifiers: *Choctawhatchee River, *Pea River, *Double Bridges Creek, *Geneva(Ala), 'Lincoln Flood', 'Hoover Flood', Standard Project Flood, Intermediate Regional Flood, Floodplain management, Subdivision regulations.

A flood in 1861, called the 'Lincoln Flood', nearly destroyed Geneva and forced it to move from the junction of the Choctawhatchee and Pea Rivers to higher ground, where in 1929 the town was again completely inundated. A levee was built around the town in the 1930's that has protected it up to the present. However, the low-lying unprotected portion of Geneva and the surrounding forest and croplands are subject to flooding from the 3 streams in the study area with water out of banks for several days along the rivers. Flood producing storms occur in all seasons but are more likely to occur in winter and spring. Flood flow is measured by four gaging stations and obstructed by four bridges. The highest flood of record on all three streams known as the 'Hoover Flood' was caused by excessive rainfall in March, 1929. Its elevation was 109.7 ft., m.s.l.d. making it on the order of a Standard Project Flood (SPF). An SPF would crest at 109.8 ft. m.d.l.d. with a peak discharge of 127,000 cfs. and might flood 7,600 acres. An Intermediate Regional Flood (IRF) would be 102.6 ft. with a peak discharge of 77,100 cfs and flood 6,800 acres. To decrease hazards of large floods, drainage pipes, flap valves, and pumping stations are employed to enable the levee to function properly. Geneva has official Land Subdivision Regulations for floodplain development. (Diefendorf-North Carolina)

SENSITIVITY ANALYSIS OF THE OPTIMUM DESIGN FLOOD EVALUATED BY AN OPTIMIZATION PROCEDURE,
Karlsruhe Univ. (West Germany). Theodor-Rehbock Lab. for River Improvement.
E. Mosonyi, W. Kiefer, and W. Buck.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 249-258. 7 fig, 4 ref.

Descriptors: *Flood control, *Flood damage, *Cost-benefit analysis, *Optimization, Flood protection, Cost analysis, Damages, Probability, Levees, Flood profiles, Land use, Flood plains, Design flood.
Identifiers: *Sensitivity analysis, *Black Forest.

The influence of various parameters on the optimum degree of development of flood control measures and flood control levees respectively was investigated. An economic evaluation using cost-benefit analysis was performed for a valley in the Black Forest region. A maximized graph of the mean annual value of net benefit expectancy was used to illustrate that for the selected case the point of optimum was mainly affected by the features of the cost function. Other parameters have less influence in the range of their possible variation. (See also W75-04213) (Terstriep-ISWS)

THE TRIANGLE AS A TENTATIVE UNIT HYDROGRAPH,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
B. M. Reich, and D. A. Wolf.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 337-349. 8 fig, 1 tab, 24 ref.

Descriptors: *Unit hydrographs, *Hydrographs, *Hydrograph analysis, *Spillways, Streamflow, *Flood control, Storage capacity, Design flood,

*Pennsylvania, Appalachian Mountain Region, Analytical techniques.

Engineers faced with designing flood control schemes or spillways for storage reservoirs seldom have adequate streamflow records from which to obtain inflow hydrographs. This is particularly true for watersheds smaller than 120 square miles in developing countries. An analysis of 69 large flood hydrographs observed on 17 watersheds across the varied geology and landscape of Pennsylvania reaffirmed the triangle as a suitable shape for unit hydrographs. Its form is different from that of the Soil Conservation Service, popularized by the United States Bureau of Reclamation. The ratio of rise-time to baselength, which determines when the unit hydrograph peak occurs, is found to vary within specifiable limits. Ninety percent of the variation in peak rates of discharge for these 1-hour unit hydrographs from watersheds of 4 through 120 square miles can be accounted for by an equation with two predicators. Application to ungaged watersheds could tentatively be extrapolated to many Appalachian states and similar hilly regions of the world with long summer humid continental or east coast continental climates. Mean annual precipitation of the study watersheds ranged from 36 through 50 inches. (See also W75-04213) (Dawes-ISWS)

A DOUBLE-TRIANGLE MODEL FOR GENERATING STORM HYDROGRAPHS,
Tennessee Valley Authority, Knoxville, Tenn. Hydrologic Research and Analysis Office.
C. V. Ardis, Jr.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 350-360. 3 fig, 1 tab, 8 ref.

Descriptors: *Unit hydrographs, *Hydrograph analysis, *Flood peak, *Model studies, Hydrographs, Hydrology, Base flow, Watersheds(Basins), Analytical techniques, Recession curves, Simulation analysis, Precipitation excess, Floods, Streamflow, Duration curves, Rainfall, Tennessee, Equations, Flood control, Storm runoff, Runoff, Appalachian Mountain Region, Southeast U.S., Design flood.
Identifiers: *Double triangle hydrograph, *Ungaged watersheds.

A procedure was developed to compute storm hydrographs at gaged or ungaged sites from rainfall data and watershed characteristics. The procedure uses a unit-response-function model to represent the response of a watershed to a given storm. The watershed unit-response- function is called a double-triangle model. The assumed double-triangle shape is very flexible and allows the model to meet the response shape-characteristics of most storms on many watersheds. Four parameters define the double-triangle model and each is a specific attribute of the model. Significant response variation was found in the parameters within and among watersheds. This response variation was nonlinear and significantly related to storm and watershed characteristics. Nonlinear relationships were developed that relate the double-triangle model parameters to these characteristics. A model for predicting the flood peak directly was also presented. Eleven watersheds and 140 storms constitute the data base. The models were tested on other data and found to be successful. Examples were shown how these models can be used to provide the storm-hydrograph answers needed for regional environmental studies. (See also W75-04213) (Dawes-ISWS)
W75-04241

RUN-OFF REGULATION OF THE ST. LAWRENCE AND ITS LIABILITY,
Bedford Inst., Dartmouth (Nova Scotia).
H. J. A. Neu.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 399-400. 3 ref.

Descriptors: *River regulation, *Runoff, *Environmental effects, *St. Lawrence River, Saline water, Sea water, Freshwater, Mixing, Ecology.

A classical example of runoff regulation is the St. Lawrence system in which large quantities of water from the spring runoff are annually held back in storage lakes and returned to the river during the low discharge period of fall and winter for optimum power production. Freshwater plays a prominent role in the generation of large-scale motions in the estuary, Gulf, and adjacent waters of the Atlantic. It initiates a circulation in which large quantities of seawater are transported from the ocean into the Gulf and up the estuary, a distance of more than 1500 km. The amount of seawater pumped in from the ocean depends on the runoff and on the distance from the sea. Biologists have been inferring that changes in the biological balance and the fluctuations of certain species are related to variations in freshwater runoff. Runoff regulations have imposed large-scale modifications on the ecosystem of the Gulf and of the coastal zone. The complex interdependency existing between the ecological elements of the river and ocean environments makes exact predictions of consequences quite difficult, particularly in the biological field. An assessment of these effects not only qualitatively but also quantitatively, emerges as one of the most urgent problems facing modern science. (See also W75-04213) (Humphreys-ISWS)

THE MEASUREMENT OF IMPACTS IN SMALL WATERSHEDS FOR FLOOD CONTROL,
New South Wales Inst. of Technology, Kensington (Australia). Dept. of Economics.
P. A. R. Maxwell, and R. M. North.
Water Resources Bulletin, Vol 10, No 6, p 1277-1287, December 1974. 1 fig, 4 tab, 9 ref.

Descriptors: *Economic impact, *Economic justification, *Cost-benefit analysis, Cost-benefit theory, *Benefits, *Flood control, Land use, Watersheds(Basins), Watershed Protect. and Flood Prev. Act, Measurement, Land appraisals, *Small watersheds, Evaluation.

An analogue method of ex post evaluation was proposed as a method of measuring the effectiveness of small watershed projects in obtaining flood control and economic benefits. Two watersheds were compared on a 'with versus without' project basis by both direct and indirect measurement of economic benefits. Direct measurements indicated that small watershed flood control projects did not generate the expected economic benefits. Indirect meaaurements of the same watersheds using land value enhancement as a surrogate suggested that the expected economic benefits were reflected in differential land values. It was concluded that the economic efficiency of small watershed projects should be measured ex ante and ex post on a 'with versus without' project basis rather than on a 'before versus after' basis either with direct or surrogate variables. RESERVOIR OPERATION THROUGH OBJECTIVE TRADE-OFFS,
Iowa Univ., Iowa City. Inst of Hydraulic Research.
T. E. Croley, II.
Water Resources Bulletin, Vol 10, No 6, p 1123-1132, December 1974. 4 fig, 31 ref.

Descriptors: *Optimum development plans, *Multiple-purpose projects, *Assessments, Planning, *Reservoir operation, Water resources development, Flood control, Value engineering, Recreation, Analytical techniques, Decision making, Management, Design, *Comprehensive planning.
Identifiers: *Multi-objective design, Objective trade-offs, *Impact evaluation design.

Water resources project developments have progressed from strictly engineering designs through economic-engineering designs to the present, all-inclusive, impact evaluation designs. The introduction of human factor objectives complicates the problem because they are noncommensurate with other objectives and they are difficult to identify quantitatively. Some of the problems that now arise concern the proper methods for consideration of several different sometimes subjectively identified, objectives in reservoir planning. The classical systems analysis approach to decision making for multiple objective problems was outlined and the inherent difficulties associated with multiple objectives and subjective estimates were identified. Techniques being used in reservoir design and operation were reviewed and discussed. An alternate technique for con

sidering noncommensurate, subjectively identified, objectives, which relates the objectives in terms of real trade-off costs and eliminates the need for a priori estimates of objective worth, was presented. The method was illustrated with three examples, including a reservoir operation problem and a cooling tower design problem. (Singh-ISWS)

4B. Groundwater Management

INTEGRATED SYSTEM IDENTIFICATION AND OPTIMIZATION FOR CONJUNCTIVE USE OF GROUND AND SURFACE WATER, PHASE II,
Case Western Reserve Univ., Cleveland, Ohio. Dept. of Systems Engineering.
Y. Y. Haimes.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 891, $5.25 in paper copy, $2.25 in microfiche. Completion Report 45IX, Ohio Water Resources Center, Columbus, (SED-WRG-74-1), September 1974. 106 p, 8 fig, 15 tab, 20 ref, 2 append. OWRT B-050-OHIO(1).

Descriptors: *Groundwater management, Surface waters, *Conjunctive use, *Aquifers, Drawdown, *Transmissivity, Recharge, *Optimization, Planning, *Water management(Applied), *Ohio, Model studies, *Storage, Pumping.
Identifiers: Fairfield Aquifer(Ohio), Miami Conservancy District(Ohio), Algebraic technological functions, Parameter identification, Hierarchical modeling.

The groundwater parameter identification model developed in Phase I has been further modified and improved as part of Phase II work. A hierarchical management model was developed and tested. The coupling of a complex multicell aquifer system was studied via an extension of the algebraic technological function approach. Functions were developed to relate the infiltration from a stream into an aquifer due to pumpage at a well. A new approach was proposed to incorporate time varying boundary conditions in a groundwater system. A predictive model was developed to demonstrate the usefulness of these response oriented models, where the decision variables include pumpage, artificial recharge, and imported water. A model for the planning and management of a groundwater system was developed, incorporating a tax-quota system. The research results were applied to the area of the lower Great Miami River with data provided by the Miami Conservancy Dist. (MCD), Dayton, Ohio. (See also W75-03201)

POSSIBLE DEVELOPMENT OF WATER FROM MADISON GROUP AND ASSOCIATED ROCK IN POWDER RIVER BASIN, MONTANA-WYOMING,
Geological Survey, Denver, Colo.
F. A. Swenson.
Report for the Northern Great Plains Resources Program, July 1, 1974. 6 p, 4 plate.

Descriptors: *Groundwater, *Water supply, Montana, *Industrial water, Hydrogeology, Basic data collections, Aquifers, Water yield, Water quality, *Wyoming.
Identifiers: *Powder River basin(Mont).

The potential for developing large groundwater supplies for industrial use in the Powder River basin of Wyoming and Montana is summarized. Records of many oil tests and several water wells indicate that the Madison Group and the underlying carbonate rocks are hydrologically connected and transmit water as a unit. Also, in many localities, the overlying Tensleep and Minnelusa sandstones are also connected with the Madison. These rocks underlie the entire basin and are exposed on the flanks of the surrounding mountains. The Madison rocks, and to a considerable extent the underlying carbonates, are fractured and cavernous. Large quantities of water have been derived from these rocks in the Midwest, Wyoming area since 1917. The Madison and underlying carbonates contain water of moderate-to-good quality that is probably suitable for industrial use. It contains too high a percentage of sodium for irrigation use. WATER RESOURCES EVALUATION OF THE SOUTHERN HIGH PLAINS OF NEW MEXICO,
New Mexico State Univ., University Park. Dept. of Agricultural Economics.
R. R. Lansford, W. Brutsaert, B. J. Creel, A. Flores, and W. Loo.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 230, $4.25 in paper copy, $2.25 in microfiche. New Mexico Water Resources Research Institute, Las Cruces, Report 044, July 1974. 59 p, 8 fig, 22 tab, 54 ref. OWRT B-037-NMEX(1).

Descriptors: *New Mexico, *Water demand, *Water resources development, Management, *Economic prediction, Natural resources, Water requirements, Resource allocation, Groundwater, Water quality, Water utilization, Human population, Employment, Linear programming, *Evaluation, Water management(Applied), *Model studies.
Identifiers: *High Plains(N Mex), *Socioeconomic models, Input-output coefficients, Hydrogeology, Groundwater appropriation.

An interdisciplinary approach to the solution of the water resource problems of the Southern High Plains in New Mexico was made possible by the integration of hydrology and geology with economics. Research procedures developed to carry out this study were closely coordinated by the investigators to achieve the primary objective of evaluation of the social and economic impacts of alternative water-use policies. A linear programming model was developed to represent the Southern High Plains economy. Inputs into the model were obtained from separate studies covering the hydrological, agricultural, municipal, and industrial areas. Three sets of alternatives were considered: (1) growth without a water constraint; (2) growth, decreasing pumpage 10 percent after 1966; (3) growth, increasing pumpage 10 percent after 1966. Without a water constraint, both production and depletions are expected to exhibit the largest increase (54.5 percent and 66.9 percent, respectively). When a 10 percent decrease in pumpage constraint is imposed in the year 2020, the value of production is reduced by $19.02 million; employment by 2931 employees; and water depletions decreased about 62 percent. When a 10 percent increase in pumpage constraint is imposed, the value of production is decreased $47.09 million below that expected when compared to a 10 percent decrease in pumpage, and water depletions are reduced only slightly (31,900 acre-feet). UTILIZATION OF MINERAL AND THERMAL SPRINGS IN IRAQ: PRELIMINARY REPORT.
Institute for Applied Research on Natural Resources, Baghdad (Iraq).
Scientific Research Foundation, Ministry of Higher Education and Scientific Research, Baghdad, Iraq. Technical Bulletin 58, March, 1974. 165 p, 10 fig, 15 tab, 4 ref.

Descriptors: *Springs, *Spring water, *Hydrogeology, *Thermal springs, *Potable water, Bacteria, Mineral water, Climatology, Climatic data, Climatic zones, Meteorological data, Seepage, Artesian wells.
Identifiers: *Iraq.

A preliminary survey of springs in Iraq was conducted to determine the development potential of this previously neglected resource. In all, 166 springs were located, mapped and classified into four categories: ordinary, mineral, thermal, and drinking water. The classification was based on hydrogeological, hydrochemical, bacteriological, and balneological characteristics of the springs. Of the springs surveyed, seven of the most promising have been considered; and three of these have specific recommendations for immediate development. A need exists for additional information on some of the located springs as well as plans for their development. A more complete survey to locate additional springs is also suggested. (Mastic-Arizona)

DETERMINING LAND USE CHANGES IN WATERSHEDS BY AERIAL PHOTOGRAPHIC MEASUREMENTS,
Clemson Univ., S. C. Dept. of Civil Engineering.
M. E. Nettles, and D. B. Stafford.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 192, $4.25 paper copy $2.25 microfiche. South Carolina Water Resources Research Institute, Clemson, Report No. 47, June 1974. 55 p, 8 fig, 3 tab, 28 ref. Partial Completion Report. OWRT A-024-SC(4). 14-01-0001-4041.

Descriptors: *Urbanization, *Land use, *Aerial photography, *Remote sensing, *Photogrammetry, Hydrology, *South Carolina, Agricultural watersheds, Watersheds(Basins).
Identifiers: *Reedy River(SC), *North Tyger River(SC), Urban watersheds.

Techniques are described for using aerial photographs to investigate land use changes in watersheds. Land use changes in two watersheds in western South Carolina were examined. The North Tyger River watershed near Spartanburg, South Carolina, has experienced significant changes in agricultural land use over the past 26 years. The Reedy River watershed, within which most of the city of Greenville, South Carolina, is located, has experienced rapid urbanization over the past 27 years. Six sets of existing aerial photographs taken at approximately five-year intervals were used to delineate, classify, code, and measure the areas of various land use classes in the two watersheds. The land use classes employed were those that had different runoff characteristics. The area occupied by each land use class was measured on scaled photographic enlargements by using a planimeter. Significant changes in land use were observed in the two watersheds over the study period. The results indicate that the use of aerial photographs to obtain data on the historical distribution of land use in watersheds represents a satisfactory approach that could be used more widely.

MORE STREAMFLOW AFTER A BARK BEETLE EPIDEMIC,
Forest Service (USDA), Ogden, Utah. Intermountain Forest and Range Experiment Station.
N. Bethlahmy.
Journal of Hydrology, Vol 23, No 3/4, p 185-189, 1974. 1 fig, 2 tab, 5 ref.

Descriptors: *Forest watersheds, Epidemics, Bark, Water beetles, *Streamflow, Water yield, Water injury, *Water loss, Water shortage, *Watersheds(Basins), *Plant diseases, *Colorado.
Identifiers: *Beetle-infested watersheds, Continental Divide(Colo), White River watershed(Colo), Elk River watershed(Colo), Yampa River watershed(Colo).

A bark beetle epidemic near the Continental Divide in Colorado destroyed the timber in two large drainages but bypassed a third drainage. The base period for this analysis was from 1911 to 1940, when the beetle population was at an epidemic level. The epidemic started in 1941 in the White River drainage, gradually advanced north and east into the Yampa River watershed, but failed to become established in the Elk River watershed where tree mortality was minor. The control was in the Elk watershed. Analysis of data revealed that major increases in streamflow occurred after the epidemic. Average annual increases in streamflow for the White and Yampa Rivers were shown for the 24-year period 1941-1965. The smallest increases occurred during the first 5-year period, when the beetle population was multiplying to epidemic proportions; the largest increases occurred 15 years later in the 1956-1960 period. (Roberts-ISWS)

4D. Watershed Protection

PROTECTING CREEKSHEDS: DEVELOPMENT AND EVALUATION OF A METHOD TO MANAGE SMALL, URBANIZING WATERSHEDS THROUGH LOCAL GOVERNMENT ACTIONS,
Huron River Watershed Council, Ann Arbor, Mich.
E. W. Say, and A. J. Dines.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 139, $7.50 in paper copy, $2.25 in microfiche. Completion Report, December 1974. 223 p. OWRT C-5278 (4219)(1).

Descriptors: Information exchange, *Planning, *Small watersheds, *Water management(Applied), *Local governments, *Urbanization, *Land use, Runoff, Open channels, Drainage systems, Michigan, Social aspects, Competing uses, Governments, Legal aspects, Zoning, Multiple use, Sediment control, Storm runoff, Wildlife conservation, Streamflow, Nonstructural alternatives, Erosion control.
Identifiers: Citizen participation, Creek corridor, Development control, Townships, Open space.

The research focused on small, urbanizing watersheds and the impacts of land use decisions on the benefits provided by the stream. The primary objective was to develop and test one method hypothesized as being effective in stimulating interest in local water resources management through land use controls among local units of government and property owners. Three small watersheds were chosen and local officials, property owners and agencies in each were involved in an intensive information exchange and dissemination effort using a number of modes of communication. Information about the streams was sought in three phases (creek benefits, creek problems, alternative management techniques) and the data provided permitted the development (and subsequent community evaluation of) of a specialized creekshed protection program. The participants regarded the information supplied as useful and appropriate. The elements of the protection programs (avoiding soil erosion/sedimentation, regulating the change in runoff characteristics and protecting the creek corridor) were viewed as most likely to be implemented in the creeksheds experiencing the greatest urbanization pressure. The approach developed is simple, can be done within the existing institutional framework and uses information generally available. Local governmental units in urbanizing areas can protect water courses through land use regulations and controls. (See also W75-03745)

PROTECTING CREEKSHEDS, ANALYSIS AND ACTION,
Huron River Watershed Council, Ann Arbor, Mich.

E. W. Say, and A. J. Dines.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 140, $3.75 in paper copy, $2.25 in microfiche. (1974). 24 p, 16 fig, 2 tab, 26 ref. OWRT C-5278(No 4219)(1).

Descriptors: *Small watersheds, *Water management(Applied), Cities, Urbanization, Land use, *Information exchange, Planning, Local governments, *Social participation.
Identifiers: *Creeksheds, *Citizen participation.

This booklet was written to provide basic information about creeksheds for those in urbanizing areas; why they are important, how they are adversely affected by urbanization and what can be done to protect creek benefits and avoid problems. It presents only the most essential information relating to small watersheds and their management. It is intended as a non-technical publication for those with an interest in protecting creeks but without experience in water resource problems. It is hoped that the booklet will serve as a source book for information and as a guide for action. The experience on which it is based is from the Great Lakes region and from Southeast Michigan in particular. However, the conditions, issues, and problems found in many other parts of the country are very similar. The management approaches suggested here for creeksheds protection and improvement will therefore have many applications elsewhere.(See also W75-03947)

EFFECT OF NITRATE AND SEDIMENT CONSTRAINTS ON ECONOMICALLY OPTIMAL DAIRY PRODUCTION,
Illinois Univ., Urbana. Agricultural Experimental Station.
S. Onishi, and E. R. Swanson.
Journal of Environmental Quality, Vol 3, No 3, p 234-238, July-September, 1974. 2 fig, 1 tab, 12 ref. OWRT B-049-ILL(6). 14-31-0001-3272.

Descriptors: *Nitrates, *Sediments, *Soil conservation, Linear programming, *Optimization, *Crop production, Erosion, Watershed management, Root zone, *Leachate, Clays.
Identifiers: Optimal crop production, Conservation village, Nitrogen application rate.

Crop systems and practices that are economically optimal in a 485.6-ha watershed with a planned reservoir were ascertained under conditions of differing constraints on water quality in the reservoir. Linear programming was the technique employed. Consideration was taken of two requirements related to sedimentation and three requirements related to NO3-N concentration in the leachate below the root zone. Six combinations of restrictions on the choice of optimal crop systems were fulfilled. For all sediment introduced into the reservoir a system of charges reduced erosion, irrespective of the limit put on NO3-N concentration in the leachate below the root zone. Relaxation of the limit of NO3-N from 10 mg/liter to no limit doubled the net income above nonland costs. (Leibowitz-FIRL)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

APPARATUS FOR DETERMINING ORGANIC CARBON CONTENT OF POLLUTED LIQUIDS,
A. Cohen.
US Patent No 3,854,881, 4 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 1137, December 17, 1974.

Descriptors: *Patents, Water pollution control, Pollution abatement, *Waste water treatment, Oxydation, Equipment, Measurement, Carbon, Carbon dioxide, *Pollutant identification.
Identifiers: *Acidification, *Organic carbon, *Infrared analyzers.

A sample stream, from the aqueous liquid source to be monitored, is continuously fed into a mixing chamber together with sufficient acid to react with and remove as carbon dioxide all of the inorganic carbon content of the sample, i.e. the carbonates in the sample. The acidified sample is scrubbed to remove all carbon dioxide produced by the carbonate-acid reaction, and the carbonate-free sample is metered into a reaction chamber. The reaction chamber has an inlet through which the sample and air for oxidizing the organic carbon are introduced; an outlet for the exit of gaseous and vapor products formed from the sample; and a granular packing material inside that is heated by electric resistor elements placed outside the chamber. The packing material is chemically inert, such as crushed quartz, and is heated to a temperature at which the organic carbon in the sample is oxidized to carbon dioxide by the air atmosphere in the chamber. Carbonaceous matter in the sample is quickly oxidized by the hot air atmosphere so that the effluent therefrom is a mixture of water vapor and other gaseous products including carbon dioxide. The amount of carbon dioxide corresponds to the amount of organic carbon originally present in the sample. The water vapor portion of the reaction chamber effluent is removed by a conventional gas-liquid separator before delivery to an infrared analyzer for measurement of the carbon dioxide component. (Sinha-OEIS)

ULTRAVIOLET SPECTROPHOTOMETRIC METHOD FOR THE DETERMINATION OF LIGNIN IN EFFLUENTS (UF-SPEKTROFOTOMETRICHESKII METOD OPREDELENIYA LIGNINA V STOCKNYKH VODAKH),
Vsesoyuznyi Nauchnyi-Issledovatelskii Institut Bumagi, Arkhangelsk (USSR).
A. A. Sokolova, L. A. Semakova, and D. P. Moseeva.
Bumazhnaya Promyshlennost', No 8, p 21-22, August, 1974. 1 fig, 3 tab, 3 ref.

Descriptors: *Pulp wastes, *Lignins, *Pollutant identification, *Sprectoscopy, *Ultraviolet radiation, Analytical techniques, Laboratory tests, Chemical analysis, Organic wastes, Wastes, Water pollution sources, Industrial wastes, Water quality control, Softwood, Coagulation, Separation techniques, Potassium compounds, Iron compounds, Polyelectrolytes, Flocculation, Monitoring.
Identifiers: Potassium alum, Aluminum sulfate, Aluminum compounds, Polyacrylamide, Black liquors(Spent kraft pulping liquors).

The suitability of the UV spectroscopic method for the determination of the effectiveness of lignin removal from pulp mill effluents was investigated. The experiments were conducted on a model solution, i.e., a 1:200 dilution of black liquor from laboratory cooks of sprucewood. Samples of the solution were coagulated with potassium alum, aluminum sulfate, ferric chloride, ferric sulfate, or ferrous sulfate. Determinations were made of oxidizability, COD, and lignin content of the filtrates, the latter by measurements of absorption at 280 nm and using a calibration curve. The best effect, i.e., the removal of 71% lignin, was obtained with 75 mg/liter of potassium alum. Aluminum sulfate gave 68.4% removal. Other coagulants gave lower degrees of purification. About 30% lignin remains in the form of low molecular weight degradation products. The results of additional experiments in which the coagulants were used simultaneously with polyacrylamide as a flocculant (20-200 mg/liter) showed that polyacrylamide does not interfere with the spectrometric determination of lignin. (Stapinski-IPC)
W75-03897

THE DETERMINATION OF MERCURY IN WATER SAMPLES FROM THE ENVIRONMENT BY NEUTRON ACTIVATION ANALYSIS,
Reactor Centrum Nederland, Petten.
H. A. Van der Sloot, and H. A. Das.
Analytica Chimica Acta, Vol 73, No 2, p 235-244, December, 1974. 6 fig, 2 tab, 13 ref.

Descriptors: *Mercury, *Neutron activation analysis, *Water analysis, Surface waters, Analytical techniques, Chemical analysis, Suspended solids, Metals, Water pollution sources, Water pollution, *Pollutant identification, Organic compounds, Inorganic compounds, Heavy metals.

A sensitive method for the determination of Hg in sea and surface waters is described. A distinction is made between inorganic, organic, and particulate Hg. In the determination of inorganic Hg, the element is isolated by reduction and volatilization, followed by absorption on a charcoal column. The total Hg content of the water with and without suspended solids is determined by absorption from the solution onto a column of charcoal. In all cases, the Hg on the absorber is determined by thermal neutron activation analysis. The limit of detection is 1 nanogram/liter. (Witt-IPC)
W75-03908

DIRECT ANALYSIS OF WATER SAMPLES FOR ORGANIC POLLUTANTS WITH GAS CHROMATOGRAPHY/MASS SPECTROMETRY,
Environmental Protection Agency, Cincinnati, Ohio.
L. E. Harris, W. L. Budde, and J. W. Eichelberger.
Analytical Chemistry, Vol 46, No 13, p 1912-1917, November, 1974. 4 fig, 2 tab, 9 ref.

Descriptors: *Organic compounds, *Water analysis, *Gas chromatography, *Mass spectrometry, *Pollutant identification, Analytical techniques, Water pollution sources, Waste identification, Water properties, Organic wastes, Chemicals, Chemical wastes.

A direct aqueous injection gas chromatography/mass spectrometry (GC/MS) procedure was explored as a supplement to conventional solvent extraction for the analysis of organic pollutants in water and waste water samples. Studies were made of the effects of relatively large pressures of water vapor on the well established electron impact fragmentation patterns, quadrupole GC/MS system performance, interaction background subtraction, and detection limits. Relatively large pressures of water vapor in the mass spectrometer had no significant effect on the impact fragmentation patterns of organic compounds or the performance of the GC/MS system. The detection limits attained by conventional data acquisition were 1-50 ppm. With real time data acquisition from subsets of the ions used in conventional mass spectrometry, the sensitivity was 50 ppb. (Witt-IPC)
W75-03910

A HIGHLY SENSITIVE TECHNIQUE FOR THE LIQUID CHROMATOGRAPHIC ANALYSIS OF PHENOLS AND OTHER ENVIRONMENTAL POLLUTANTS,
Canada Centre for Inland Waters, Burlington (Ontario).
A. A. Wolkoff, and R. H. Larose.
Journal of Chromatography, Vol 99, p 731-743, November 6, 1974. 7 fig, 4 tab, 33 ref.

Descriptors: *Phenols, *Water analysis, *Chromatography, *Pollutant identification, Analytical techniques, Organic compounds, Aromatic compounds, Water pollution sources, Water properties, Fluorescence, Spectroscopy.
Identifiers: Cerium compounds.

A highly sensitive technique is described for the analysis of phenols and other environmental pollutants in water by liquid chromatography. The system utilizes a reaction detector whereby cerium(IV) sulfate is reacted with phenols in the column effluent, and the cerium(III) thus produced is detected by fluorescence spectroscopy. The detector shows good linearity in the region 10-230 ppb of phenol. When combined with suitable concentration techniques, the lower limit of detection of phenols in environmental samples is about 0.4 ppb. (Witt-IPC)
W75-03911

MONITOR FOR THE QUALITY OF AUSTRALIA'S WATER RESOURCES,
Commonwealth Scientific and Industrial Research Organization, Clayton (Australia). Div. of Chemical Physics.
G. F. Box.
Australian Science and Technology, Vol 12, No 3, p 14-15, October-November, 1974. 2 fig.

Descriptors: *Electrical conductance, *Monitoring, *Water quality, *Dissolved solids, Surface waters, Measurement, Instrumentation, Logging(Recording), Salinity, Water pollution, *Australia, *Pollutant identification.

A compact rugged instrument has been designed to record at 12-hourly intervals the total dissolved solids content of surface waters in the range 100 to 10,000 ppm with accuracy of the order of plus or minus 5% of the full range. The conductivity of the solution under test is measured by an inductive sensing head, and the resulting signal is evaluated by a successive-approximation measuring circuit. The instrument is battery-powered and capable of operating unattended for at least three months. It may be produced either in a totally-immersed self-contained form, or as a land-based recording unit connected by cable to the immersed sensing head; in the latter case it can be interfaced to a wide range or recording equipment currently used in Australia. (Levick-CSIRO)

DETECTION OF WATER POLLUTANTS BY A CO2 LASER,
Technische Universitaet, Munich (West Germany). Physikdepartment.
G. Kraus, M. Maier, and N. Kaiser.
Optics Communications, Vol 11, No 2, p 175-177, June, 1974. 1 fig, 5 ref.

Descriptors: *Water pollution, *Lasers, *Infrared radiation, *Absorption, *Spectroscopy, Industrial pollution, Sewage, Lakes, Rivers, Carbon dioxide, Sulfates, Ions.
Identifiers: Inorganic anions, Absorption bands, Vibrational and rotational absorption bands.

The concentration of SO4 ions in the sewage of a textile plant was measured by the infra-red absorption of a cw CO2 laser. The detection sensitivity was determined at about 50 mg/liter. Infra-red absorption spectroscopy is an effective technique in the detection of small concentrations of organic and inorganic molecules. The molecules' vibrational and rotational absorption bands are the identifying factors. Spectroscopic techniques have lately been used for the quantitative measurement of air pollutants' concentration. In dealing with water pollution, many common inorganic anions exhibit characteristic absorption bands in the wavelength region between 6 and 11 micrometers. The major difficulties in measuring the concentration of pollutants dissolved in water are: that pure water has a high absorption in the infra-red region; and that the concentration of the pollutants is generally very small, ranging from 1 mg/liter or less in clean lakes and rivers to about 1000 mg/liter in the sewage of industrial plants. These concentrations are not measurable with conventional infra-red light sources and spectrometers where detection of several g/liter is achieved. A cw CO2 laser in conjunction with a sensitive two-beam method resolves the difficulty. (Leibowitz-FIRL)
W75-04012

DETERMINATION OF PARTS PER BILLION SULFIDE IN WATER WITH THE SULFIDE-SELECTIVE ELECTRODE,
Du Pont de Nemours (E. I.) and Co., Aiken, S.C. Savannah River Lab.
E. Baumann.
Analytical Chemistry, Vol 46, No 9, p 1345-1347, August, 1974. 1 fig, 2 tab, 5 ref.

Descriptors: *Sulfides, *Water pollution, *Electrodes, Chemical wastes, Heavy metals, Potentiometric levels, *Pollutant identification.
Identifiers: *Sulfide-selective electrode, Sodium salicylate, Dithizone extraction, Ascorbic acid, Alkaline EDTA.

The sulfide-selective electrode is helpful in the routine determination of total sulfide in water due to the simplicity of measurement and absence of interferences. A procedure developed by Orion Research Incorporated, with a sulfide antitoxicant buffer of sodium salicylate, ascorbic acid, and sodium hydroxide, determines sulfide contents as low as 0.1 ppm. This sensitivity was extended to 30 ppb by the removal of heavy metals from the sodium salicylate by dithizone extraction. A preconcentration step was incorporated in the process, extending the determination to a lower ppb range. The sulfide was separated as ZnS, coprecipitated with Zn(OH)2, and dissolved in alkaline EDTA-ascorbic acid solution for potentiometric measurement with the sulfide-selective electrode. Higher concentrations of sulfide were determined without the preconcentration step. (Leibowitz-FIRL)

ACCUMULATION OF MERCURY BY FISH AND TURTLES OF THE LITTLE PINEY RIVER,
Missouri Univ., Rolla. Dept. of Chemistry.
G. L. Bertrand.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 253, $3.25 in paper copy, $2.25 in microfiche. Missouri Water Resources Research Center, Columbia. Completion Report, (1974). 5 p, 1 fig. OWRT A-067-MO(1).

Descriptors: *Mercury, Fish, *Turtles, Aquatic animals, *Trout, *Missouri, Fungicides, Analytical techniques, *Pollutant identification, Water pollution effects.
Identifiers: *Atomic absorption.

Trout that had been continuously frozen since they were taken from Missouri streams in the 1946-50 period were analysed for mercury. These analyses (flameless atomic absorption) were compared with those of the same species collected recently from the same streams. The older fish had a much higher mercury content (about 3 ppm mercury). Mercury content of trout and turtles caught in 1974 ranged from 0.2 to 0.4 ppm. Two explanations are suggested for the higher mercury content of the older fish; (a) Fungicides, containing mercury, formerly added as seed treatments are no longer used, and (b) most of the older fish were raised under natural conditions, while most current catches are now raised in hatcheries and regularly released in the streams.

DETERMINATION OF RADIOISOTOPE FALLOUT FROM ITS CONTENT IN CHRONOLOGICAL LAYERS OF HIGH-ALTITUDE GLACIERS,
E. N. Davydov, K. P. Makhon'ko, M. A. Tsevelev, and Z. S. Shulepko.
In: Nuclear Meteorology, Proceedings of the All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 29-36, 1 fig, 5 tab, 12 ref.

Descriptors: Meteorology, Nuclear energy, *Nuclear explosions, *Fallout, *Glaciers, *Ice, *Firn, *Snow, Measurement, Strontium, Cesium, Cerium, Manganese, Ruthenium, Lead, Migration, Movement, Radioisotopes.

The contents of Sr-90, Cs-137, Ce-144, Mn-54, Ru-106, and Pb-210 are determined in chronological layers of neve and ice in high-altitude glaciers of the Caucasus and Tyan-Shan. The annual fallout of Cs-137 determined by means of a cuvette-type collector is found to agree satisfactorily with the fallout determined from the Cs-137 content in the chronological layers of the glacier in the period 1963-1967. A similar comparison for Sr-90 in the period 1956-1967 showed that the proportion of Sr-90 contained in the chronological layers of these glaciers is about 10% of the atmospheric fallout of the isotope, which corresponds roughly to the proportion of Sr existing in indissoluble form. About 90% of Sr-90 and roughly 40% of Pb-210, falling on the glacier surface from the atmosphere, are eliminated together with the melted snow, while Cs-137 hardly migrates at all. The time variation in the fallout of different isotopes, determined from their content in chronological layers of the glaciers, led to the following value for the half-removal period of isotopes of fission products from the atmosphere: T(Sub 1/2) approx. 11 months. The figure for Mn-54 is T(Sub 1/2) approx. 28 months. (See also W75-04054) (Houser-ORNL)

RADIOACTIVE ISOTOPES OF EUROPIUM PRODUCED BY NUCLEAR BLASTS,
S. V. Iokhel'son, I. M. Nazarov, F. Y. Rovinskii, V. P. Chirkov, and E. I. Yushkan.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 37-39, 8 ref.

Descriptors: Meteorology, Nuclear energy, *Nuclear explosions, *Air pollution, *Fallout, Transport, *Radioisotopes, Water pollution, Soil contamination, Mosses, Analytical techniques, Radiochemical analysis, Evaluation, Density, *Nevada.
Identifiers: Nevada Test Site, Lake Rits(USSR), *Europium.

Nuclear blasts lead to the appearance of different radioisotopes of europium: europium-155 (T(sub 1/2) = 1.7 years), europium-156 (T(sub 1/2) = 15.4 days), which are fission fragments, and europium-152 (T(sub 1/2) = 12 years), europium-154 (T(sub 1/2) = 16 years) - products of activation reactions. According to data in the literature, these isotopes were detected in the epicentral region of nuclear tests conducted in Nevada. On the other hand, they have not been detected in the composition of radioactive global contamination of the earth's surface. To determine the contribution of long-lived europium radioisotopes to the global contamination of a locality, a sample of moss gathered in the Caucasus (in the vicinity of Lake Rits) was analyzed by the methods of radiochemistry and gamma-spectrometry. In the sample, in addition to other fragmentation products, the presence of europium-155 was detected and identified reliably for the first time. It was also established reliably that no europium-152 and 154 is present. The density of the global contamination of dry land by europium-155 and its contribution to the gamma-radiation dose were evaluated. (See also W75-04054) (Houser-ORNL)

RATE OF ATMOSPHERIC FALLOUT OF CESIUM-137 AND STRONTIUM-90 AEROSOLS,
A. S. Zykova, E. L. Telushkina, V. P. Rublevskii, G. P. Efremova, and G. A. Kuznetsova.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 57-60, 3 tab, 3 ref.

Descriptors: *Fallout, *Cesium, *Strontium, *Meteorology, *Nuclear energy, Data collections, Aerosols, Air pollution, *Radioisotopes, Measurement.

Data are given on the fallout density of Cs-137 and Sr-90 aerosols in Moscow for the period 1962 to 1968 and on the concentration of these isotopes in the ground layer of atmospheric air. The ratio of Cs-137 and Sr-90 aerosols in radioactive precipitation in these years was always larger than the analogous ratio between these isotopes in air. This leads one to suppose that the fallout rate of aerosols carrying Cs-137 is somewhat larger than the fallout rate of aerosols carrying Sr-90. An assessment of the fallout rate of these aerosols established that, on the average, for the period 1962 to 1968 the fallout rate of Cs-137 aerosols was 1.7 plus or minus 0.4 cm/sec, and of Sr-90 aerosols 1.5 plus or minus 0.4 cm/sec, i.e., the fallout rate of Cs-137 aerosols is larger by 14% than the fallout rate of Sr-90 aerosols. SOME FEATURES OF ATMOSPHERE CLEANSING BY GROUND CONDENSATION,
B. I. Styro, and N. P. Dargene.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 173-181, 3 fig, 1 tab, 6 ref.

Descriptors: *Meteorology, *Radioactivity, *Measurement, *Air pollution, *Dew, Sampling, Polonium, Lead, Bismuth, Radioisotopes, Assay, Fallout, Aerosols, Condensation, Electrochemistry, Research and Development.
Identifiers: *Specific radioactivity.

Simultaneous measurements were conducted of the radioactivity of air and dew samples formed on the upper and lower surfaces of a polyethylene film spread on closely cut grass. The dew samples were collected in two ways: (1) several identical films were spread simultaneously on the grass surface, the sample from the first film being taken immediately after the formation of the dew with subsequent sampling at hourly intervals throughout the night; (2) a single polyethylene film on the selected area was changed hourly and the radioactivity of the dew formed on it determined. The dew samples collected by the two methods were called 'old' and 'new' dew, respectively. The short-lived alpha-radioactivity of the dew due to a decay of 84Po218, 82Pb214, and 83Bi214 was determined. For old dew they lie in the range (0.1-24.5) times 10(-11) curie/mliter, and for the new dew in the range (0.1-26) times 10(-11) curie/mliter. The parameter of radioactivity removal from the air during the fall of dew is (0.02-1) times 10(-4) sec(-1) for old dew and (0.3-1) times 10(-4) sec (-1) for new dew. A parabolic relationship was obtained between the specific radioactivity of new dew and the specific radioactivity of the air, which points to the growth in washout intensity with increasing air radioactivity. The specific radioactivity and the coefficient of nonradioactive removal of radioactive substances by old dew was studied as a function of the amount of fallen dew. It was concluded that atmospheric cleansing occurs mainly: (1) through direct condensation of water vapor on radioactive aerosols; (2) under the influence of electric interactions between the aerosol particles and the dewdrops. ACCOUNTING FOR SOME NONSTEADY PROCESSES IN RECORDING NATURAL AIR RADIOACTIVITY,
V. N. Bakulin, and V. P. Matulyavichyus.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 187-193, 2 fig, 5 ref.

Descriptors: *Meteorology, *Radon, *Measurement, *Filters, *Measuring instruments, Air pollution, Equilibrium, Research and development, Radiation, Radioactivity, Theoretical analysis.

The accumulation of radon disintegration products is studied theoretically for recorders with fixed and mobile filters, for constant and linearly increasing concentration of these products in air, taking into account the relation between their concentrations. Neglecting the equilibrium in the radon series can lead to an error several times greater when determining the concentration of radon and its disintegration products in air from measurements of the activity of recorder filters. A formula is proposed for determining constant concentrations of Rn and its disintegration products in air by various suction methods in relation to the degree of equilibrium in the radon series. The optimum filtration time for a recorder with a mobile filter is at most 1.5-2 hrs; longer times do not practically increase the sensitivity of the setup, but increase the recorder's time constant and render more difficult determination of the actual time variation in the concentration of radioactive substances. A method is suggested for determining the relationship between radon disintegration products measured by two counters, one positioned in the path of the recorder film. Very reliable data can thus be obtained for an alpha-recorder, at minimum spacing between the counters. (See also W75-04054) (Houser-ORNL)

LONG-LIVED ALPHA-RADIOACTIVITY IN FALLOUT AT VILNIUS AND AT VARIOUS ATLANTIC LATITUDES,
B. I. Styro, N. K. Shpirkauskaite, V. N. Gasyunas, and V. M. Kuptsov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 201-207, 2 fig, 2 tab, 8 ref.

Descriptors: Meteorology, Nuclear energy, *Radioactivity, *Radioisotopes, *Uranium, *Thorium, *Plutonium, *Fallout, Rain, Precipitation(Atmospheric), Measurement, Analytical techniques, Turbulence, Cyclones, Wind, Latitudinal studies, *Atlantic Ocean, Water pollution.
Identifiers: Alpha radiation.

The isotope composition of long-lived alpha-radiation in atmospheric precipitation at Vilnius and at different latitudes over the Atlantic is investigated. Relevant data were obtained for each 10 deg latitudinal strip between 60 deg N and 70 deg S over the Atlantic from Oct 16, 1966, till March 1, 1967, and from Oct. 21, 1967, till Jan. 26, 1968. The fallout density of long-lived alpha-radioactivity is described by the geographical distribution with maxima at 50 - 40 deg and 20 - 30 deg N and S and with minima at 40 - 30 deg N and S. The U238, Th232, and Pu239 contents in atmospheric

precipitation were measured using an alpha-spectrometer with ion chamber, and their ratios were calculated. For Vilnius, the U238 values are 0.41 to 7.33 times 10(-5) g/g, the Th232 values are 0.014 to 7.27 times 10(-5) g/g, and the Pu239 values are 0.04 to 3.10 times 10(-11) g/g; over the Atlantic the values are 0.18 to 9.5 times 10(-5), 0 to (0.52-1.8) times 10(-5) and 0.06 to 7.37 times 10(-10) g per gram of ash residue, respectively. SEASONAL BERYLLIUM-7 VARIATIONS IN GROUND LEVEL AIR,
L. I. Gedenov, Z. G. Gritchenko, and V. M. Flegontov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 208-212, 2 fig, 1 tab, 17 ref.

Descriptors: *Meteorology, *Fallout, *Beryllium, *Rain, *Air pollution, Measurement, Seasonal, Summer, Density, Fluctuations, Microenvironment, Sampling, Correlation analysis, Systems analysis, Date collections.
Identifiers: *Troposphere, *Stratosphere.

The content of cosmogonic Be7 in ground level air and atmospheric precipitation was determined in 1960-1968 in the environs of Leningrad from the gamma-radiation with the aid of a scintillation and a Ge(Li) drift gamma-spectrometer. In periods when the atmosphere was cleansed of short-lived radionuclides of artificial origin, Be7 was determined in daily samples of atmospheric aerosols filtered from the air. Be7 in ground level air sometimes varied tenfold from day to day. A great amount of experimental material was collected in the seven years of observations and an average curve was plotted of the mean-monthly variation of Be7 concentration in ground level air. It was thus possible to distinguish a constant and a variable component in the variation of Be7 concentration. Be7, continuously being formed in the troposphere, is apparently the constant component, with superimposed periodic components due to seasonal Be7 penetration from the stratosphere, attaining great values in summer. A statistical analysis of the variable component showed that it is well described by a Gauss function of type P(t) approx. e(-t sq/2 sigma sq), where t is the number of days elapsed from the peak Be7 concentration in the ground level air, and sigma = 60 plus or minus 2 days is the parameter of the Gaussian distribution. Be7 concentration in ground level air is highest every June, (9 + 1) times 10(-14) curie/m cu, and lowest in December (3.5 plus or minus 1) times 10(-14) curie/m cu. There is a 3-to-2 ratio of the overall number of Be7 atoms in ground level air arriving from the stratosphere to those arriving from the troposphere. A constant average of (4.6 plus or minus 0.2) times 10(-5) atom of Be7 is deposited annually per square centimeter of ground in the Leningrad area. (See also W75-04054) (Houser-ORNL)
W75-04084

CONCENTRATION OF SODIUM RADIOISOTOPES IN THE GROUND LAYER OF THE ATMOSPHERE AND IN PRECIPITATION,
R. Y. Yasyulenis, V. Y. Luyanas, and B. I. Styro.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 213-215, 1 fig, 1 tab, 7 ref.

Descriptors: *Meteorology, *Sodium, *Fallout, *Rain, Precipitation(Atmospheric), Measurement, Argon, Air pollution, Atmosphere, Correlation analysis, *Radioisotopes.
Identifiers: Cosmic radiation, Cosmogonic radioisotopes.

Measurements of sodium isotope concentrations in rainwater are examined. The sodium was extracted with KU-2 cationite, Na22 was measured from the positronic radiation, and Na24 from beta-gamma coincidences. The ratios of Na22 and Na24 concentrations in the same rainwater sample were 70 and 120. The measured ratios are compared with theoretical evaluations of the concentration ratios in the air. (See also W75-04054) (Houser-ORNL)
W75-04085

CONCENTRATION OF PHOSPHORUS RADIOISOTOPES IN THE GROUND LAYERS OF THE ATMOSPHERE AND IN PRECIPITATION,
D. A. Shopauskene, and V. P. Shvedov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 216-219, 1 fig, 2 tab, 8 ref.

Descriptors: *Meteorology, *Fallout, *Phosphorus, *Measurement, *Air pollution, Sampling, Argon, Precipitation(Atmospheric), Rain, Radioisotopes, Correlation analysis.
Identifiers: Cosmic radiation, Interaction, Torrential rain.

Results of systematic measurements of P32 and P33 concentrations are reported. The measurements were carried out in 1967-1969 in the areas of Vilnius, Lithuania, and Cornesti (Moldavian SSR). The maximum values reached 13.8 times 10(-15) curie/m cu for P32 and 3.6 times 10(-15) curie/m cu for P33; the minima did not exceed 0.4 and 0.15 times 10(-15) curie/m cu, respectively, in air samples taken from the ground layer of the atmosphere. The average P32 concentration in atmospheric precipitation was 0.47 times 10(-12) curie/liter at Vilnius; in samples taken from torrential rains at Cornesti the P32 concentration reached 10.9 times 10(-15) curie/liter. (See also W75-04054) (Houser-ORNL)
W75-04086

RADIUM-226 IN ATMOSPHERIC PRECIPITATION, AND THE POSSIBILITIES FOR LEAD-210, BISMUTH-210 AND POLONIUM-210 TO PENETRATE THE ATMOSPHERE FROM THE EARTH'S SURFACE,
V. D. Vilenskii.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 220-223, 2 tab, 9 ref.

Descriptors: *Meteorology, *Radioisotopes, *Radium, *Lead, *Bismuth, *Polonium, *Fallout, *Air pollution, Measurement, Precipitation(Atmospheric), Rain, Atmosphere.

The intensity of atmospheric Ra226 and Pb210 fallout in the Moscow area in 1967-1969 was determined. It varied between 0.08 and 1.8 micron curie/km2. day for Ra226 (mean-annual value 0.18 mcurie/km2.year) and between 1 and 18.6 micron curie/km2.day for Pb210 (mean-annual value 2.1 mcurie/km2.year). The ratio of Ra226 to Pb210 concentrations in atmospheric precipitation varied between 0.024 and 0.222, the mean-annual value being 0.086. Assuming Ra226 penetrates the atmosphere from the earth's surface along with dust, the proportions of Pb210, Bi210 and Po210 penetrating the atmosphere with the dust have been evaluated along with the overall concentration of these radioisotopes in atmospheric precipitation. The natural radioactivity of atmospheric dust is shown to possibly influence the proportion of isotopes used for evaluating the rate of atmospheric scavenging. (See also W75-04054) (Houser-ORNL)
W75-04087

POLONIUM-210 IN THE ATMOSPHERE AND ITS RATIO TO LEAD-210,
S. S. Shalaveyus, and B. I. Styro.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 224-231, 3 fig, 1 tab, 8 ref.

Descriptors: *Meteorology, *Polonium, *Lead, *Atmosphere, *Air pollution, Precipitation(Atmospheric), Rain, Scavengers, Sampling, Analytical techniques.

The Pb210 and Po210 concentrations in atmospheric air and precipitation were measured in the environs of Vilnius. Po210 was determined from its alpha-activity after being separated from the other alpha-radiating elements by spontaneous precipation on copper. The purity of Po210 separation was checked with the aid of A-2 nuclear emulsions. EDE-10P anionite was used to separate Pb210. The chemical yield was determined from the carrier, and the purity from the Bi210 accumulation curve. In 1966-1968, the Po210 concentration in atmospheric air was 3.5 to 71.4.10-16 curie/m3. The Po210/Pb210 ratio in that period fluctuated between 0.07 and 0.22; the higher values indicate that air in which Pb210 and Po210 has accumulated for a long time was sometimes released into the ground layer. In 1967-1968, the Po210 concentration in precipitation varied between 0.2 and 1.9.10-12 curie/liter, and the Po210/Pb210 ratio varied between 0.1 and 0.37. An inverse correlation was found between the Po210 concentration in precipitation and that in the atmosphere. The average residence time of Po210 and Pb210 in the atmosphere was about 32 days. (See also W75-04054) (Houser-ORNL)
W75-04088

TIME FLUCTUATIONS OF LEAD-210 CONCENTRATION IN THE GROUND LAYER OF THE ATMOSPHERE,
S. G. Malakhov, V. A. Trufakin, and Z. S. Shulepko.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 232-238, 5 tab, 12 ref.

Descriptors: *Meteorology, *Air pollution, *Atmosphere, *Lead, *Troposphere, Measurement, Environmental effects, Fluctuations, Seasonal, Stability, Arctic, Anarctic, Land, Oceans.

Data on the mean-annual Pb210 concentration in the ground layer of the atmosphere are given for various points in the world. This concentration varies between 10-14 and 10-15 curie/m3 deep inland, 1 and 2.10-15 curie/m3 over the oceans in the northern hemisphere, and equals 10-15 curie/m3 in the polar areas of both hemispheres. Measurements in the Antarctic have revealed seasonal variations with a maximum in summer. Short-term (2-3 day) fluctuations are studied and assessed from measurements around Kirov. Cold-air advection from the Arctic usually reduces considerably the Pb210 concentration. (See also W75-04054) (Houser-ORNL)
W75-04089

FILTERING AEROSOLS WITH NATURAL ATMOSPHERIC RADIOACTIVITY THROUGH FIBROUS MATERIALS,
B. I. Ogorodnikov, V. I. Skitovich, and E. A. Sitalo.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 245-254, 7 fig, 1 tab, 16 ref.

Descriptors: *Meteorology, *Filters, *Atmosphere, *Radioactivity, *Radon, Separation techniques, Filters, Particle size, Efficiencies, Evaluation, Fibers, *Aerosols.
Identifiers: *Fibrous materials.

It has been proved experimentally that, at a filtration rate of about 150 cm/sec, FPP-15 and FPA-1 materials have approximately the same efficiency but the former is more effective at a rate of about 10 cm/sec owing to the presence of electrostatic charges on its fibers. FP material is suitable for use in the upper atmosphere, as its efficiency in trapping aerosols of all sizes increases. For in

stance, the efficiency of FPA-15 material in trapping aerosols of about 0.035 micron particle radius at filtration rates of 1 to 65 cm/sec is approximately 10 to 12 times as high at 27 km as at ground level. Study of radioactivity distribution over the layers of the filtering material has shown that particles of that size account for 40 to 60% of the radioactivity of radon daughter products in the ground layer of the atmosphere. EP filtering was studied experimentally with air containing coarse aerosols (1 to 15 micron) and with practically pure air containing a large amount of free atomic Ra daughter products. The 'free' products filter with very high efficiency with a high diffusion coefficient, even at rates of 300 cm/sec. (See also W75-04054) (Houser-ORNL)
W75-04091

DEVELOPMENT OF A METHOD FOR DETERMINING THE SIZE DISTRIBUTION OF RADIOACTIVE AEROSOLS WITH THE AID OF FILTERING MATERIALS,
B. I. Ogorodnikov, E. A. Sitalo, V. I. Skitovich, and I. E. Konstantinov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 255-258, 2 fig, 2 tab, 5 ref.

Descriptors: *Meteorology, *Radioactivity, *Filters, Efficiencies, Research and development, Methodology, *Aerosols, Size, Distribution, *Radioisotopes, Zirconium, Cesium, Beryllium.
Identifiers: Fibrous materials.

The efficiency of aerosol trapping by fibrous FP filtering materials depends on the rate of filtration, the diameters of the aerosol particles and of the filter fibers, and the thickness of the filtering layer. Through the right choice of parameters, one can achieve a selective retention of aerosols of a certain size range in the successive layers of filtering materials. The filtering characteristics of FPP-3, FPP-70 and FPA-100 materials were determined in the laboratory with aerosols of 0.035 to 0.5 micron particle radius. Linear filtration rates of about 1.5-2.0 m/sec were found to be adequate for investigating the size distribution of artificial radioactive aerosols, when the aerosols are mainly trapped by inertial effect. In this case, if FPP-70--0.3 material is used in the front layer and FPP-3--1.2 in the rear, the first filter retains over 95% of the aerosol particles of 0.5 micron radius and less than 20% of the particles of about 0.035 micron radius. The latter are practically all trapped by the rear filter. Various combinations of layers of FPP-70 and FPP-3 filtering materials were tested while taking radioactive aerosol samples at filtration rates of 1.0 to 1.6 m/sec. Much of the Zr95, Cs137 and Be7 is bound to particles of 0.2 to 0.25 micron average radius. For all isotopes, at least 10% of the overall activity is carried by particles below 0.1 micron. (See also W75-04054) (Houser-ORNL)
W75-04092

PRELIMINARY DATA ON THE MEASUREMENT OF THE ATMOSPHERIC AEROSOL CHARACTERISTICS WITH A CENTRIFUGAL SPECTROMETER,
Y. N. Redkin.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 259-272, 8 fig, 14 ref.

Descriptors: *Meteorology, Measurement, *Aerosols, *Instrumentation, *Radioactivity, Research and development, Theoretical analysis, Evaluation, Efficiencies, Model studies, Centrifugation, *Spectrophotometry, *Pollutant identification.
Identifiers: *Spectrometers.

An aerosol spectrometer is described which makes it possible to obtain continuous spectra of particles for Stokes radii RS between 0.4 and 10 micro. A relationship phi = phi(RS) whose log-log plot for particles of RS greater than 10-4 cm is almost a straight line is derived from the equation of particle motion in a viscous space for a rotating system of coordinates. Here phi is the angle of particle deviation from a radius passing through the point from which the particle started moving. The spectrometer model was built as a hollow, rotating steel disk, through the axis of which aerosol is pumped. Owing to centrifugal sedimentation, part of the dust penetrates special slots to form a pencil of rays splitting more and more as the particles move away from the axis of rotation. The coarser the particle, the larger the angle of its deviation. A theoretical evaluation of the efficiency of this device showed it to depend very little on particle size at RS greater than 10-4 cm (Being 65 to 70%), as confirmed by the results of a calibration using puffball and lycopodium spores. The distribution of alpha-activity of particles of RS = 0.4.10-4 cm varies little and is almost only a hundredth of the specific overall alpha-activity measured on an FPP filter. (See also W75-04054) (Houser-ORNL)
W75-04093

MEASURING THE CONCENTRATION OF HIGHLY-DISPERSE RADIOACTIVE AEROSOLS BY THE DIFFUSION METHOD,
S. V. Kolerskii, Yu. V. Kuznetsov, S. O. Lekhtmakher, N. M. Polev, and L. S. Ruzer.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 273-278, 2 fig, 1 tab, 12 ref.

Descriptors: *Meteorology, *Measurement, *Aerosols, *Radioactivity, Methodology, *Diffusion, Dispersion, Atmosphere, Gases, Particle size.
Identifiers: Coefficient of deposition.

Described is the application of the diffusion method to the determination of the proportion of free atoms and of all the ultrahighly disperse aerosols (molecular complexes) formed through interaction of free atoms with the molecules of the various gases in the air, in the overall concentration of radioactive aerosols of emanation daughter products in the air. The coefficient of deposition of ultrahighly disperse particles in a cylindrical channel, calculated from formulas of Gormley and Kennedy, is affected by an error of 3 to 5% at most, due to the fact that the variable distribution of flow velocities in the inflow section of the channel is disregarded in the formulas. The errors of the method are discussed, and the method is shown to facilitate reliable measurements of the proportion of ultrahighly disperse radioactive aerosols of emanation daughter products, if this proportion is at least 10 to 20%. SEPARATE DETERMINATION OF RN, RAA, RAB, AND RAC CONCENTRATIONS IN AIR FROM THE ALPHA-ACTIVITY DECAY CURVE OF A FILTER,
V. N. Bakulin, and B. G. Starikov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 279-285, 3 fig, 1 tab, 18 ref.

Descriptors: *Meteorology, *Fallout, *Radon, *Air pollution, *Soil contamination, Filtration, Separation techniques, Troposphere, Turbulence, Polonium, Lead, Bismuth.
Identifiers: Alpha activity, Decay curve, Daughter products.

The relationships between radon and its decay products are of interest when studying turbulent agitation and contaminant washout processes in the lower troposphere. An examination of the different methods of separate determination of the concentrations of radon daughter products shows that only some of them yield satisfactory results at low atmospheric concentrations of radon. An analytical analog has been developed of the graphical method of separate determination of Po218, Pb214 and Bi214 concentrations from the curve of filter alpha-activity decay; the analog is as accurate as the least squares method for three unknowns, but the calculations are incomparably simpler. A comparison of these methods for known proportions of the radon decay products proved the adequacy of the proposed method. The existence of standard proportions between the short-lived radon decay products under natural conditions was demonstrated; they make it possible to determine the concentration of each of them from the alpha-decay curve within 11 to 60 min from the end of filtration. W75-04095

NEW METHODS OF MEASURING RN220 (THORON) EXHALATION AND SOME RESULTS,
B. I. Styro, T. N. Nedvetskaite, and E. E. Sen'ko.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 286-292, 4 fig, 4 tab, 10 ref.

Descriptors: *Meteorology, *Measurement, Methodology, *Radon, *Thoron, Research and development, *Instrumentation, Ion exchange, Absorption, Sites, Data collections.
Identifiers: Exhalation, Pearson collector, Ion chamber.

Two new methods are proposed for the measurement of Rn220 exhalation. One uses a Pearson collector combined with a decay chamber for radioactive emanations. In the other, the Pearson collector is replaced by an accumulation chamber connected to three auxiliary decay chambers through which the air flows in from the surrounding space with already decaying Rn220. At the same time, these chambers serve for equalizing the pressure in the accumulator. After passing through the decay chamber, the Rn220 and Rn222 daughter products formed there were trapped on an LFS-1 filter which, after 6 hours of Rn222 daughter products decay, was brought into contact with an A-2 nuclear emulsion. The setups were calibrated with Tb232 salt which was in equilibrium with the decay products. Since the calibration coefficient at low sampling rates fluctuated between 2 and 5%, the air penetrating the decay chamber was ionized by corona discharge and nuclear emulsions helped considerably in raising the lower sensitivity limit of Rn220 exhalation measurement (10 to the minus 17 to 10 to the minus 18 curie/sq cm.sec depending on sampling duration). The error of Rn220 exhalation measurement by these two methods does not exceed 20%. Data are provided on the diurnal variation in Rn220 exhalation and mean exhalation values for various states of the earth's surface. (See also W75-04054) (Houser-ORNL)
W75-04096

A SIMPLE TWO-DIMENSIONAL ANALYZER OF BETA-GAMMA COINCIDENCES IN THE STUDY OF RADIOACTIVE FALLOUT SAMPLES,
E. F. Kovnatskii, E. I. Roslyi, and A. N. Silant'ev.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 293-296, 2 fig, 4 ref.

Descriptors: *Radiation, *Measurement, *Environment, *Instrumentation, Design criteria, Data collections, *Spectrophotometry, Pollutant identification.
Identifiers: *Spectrometer.

A two-dimensional analyzer of beta-gamma coincidences, based on two commercial AI-100 analyzers is described. The setup facilitates the recording of coincidence spectra during the measurement, on a punch tape on which are recorded, at the end of the measurement, the beta and gamma spectra picked up by a single-crystal spectrometer. A functional circuit of the setup and a diagram of the control unit are given. (See also W75-04054) (Houser-ORNL)

W75-04097

SPECTROMETRIC METHOD OF MEASURING THE CONCENTRATION OF NATURAL RADIOACTIVE AEROSOLS,
V. G. Labushkin, V. I. Popov, and L. S. Ruzer.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 297-309, 5 fig, 2 tab, 27 ref.

Descriptors: *Meteorology, *Radioactivity, Measurement, *Assay, *Aerosols, Radioisotopes, Radon, Thoron, Instrumentation, Environment, Methodology, *Spectrophotometry, *Pollutant identification.
Identifiers: Spectrometers.

Discussed is a spectrometric method of determining the concentration of natural atmospheric radioactive aerosols formed by radon and thoron decay daughter products. The determination of radon daughter product concentrations is accompanied by measurement of the alpha(minus) and beta(minus) activity of the disperse phase of aerosols deposited on a fine-fibered LFS-1 (AFA--RSP-10,20) filter by means of scintillation spectrometric detection units. For a simultaneous measurement of the concentration of daughter products of both radon and thoron, one can use a spectrometric unit for the detection of alpha(minus) radiation, composed of 0.3 to 0.4 mm thick CsI(Tl) crystal of 63 mm diameter and a FEU-52 photomultiplier. The adoption of these spectroscopic methods considerably reduces the error and, in addition, facilitates determination of the self-absorption of alpha(minus) radiation in the aerosol sample and the dust content of the air. Also reported is an investigation of the spectrometric unit for the detection of alpha(minus) radiation from a wide-area (over 100-cm sq) aerosol sample. The unit consists of CsI (Tl) crystal and a FEU-49 photomultiplier. The topography of the photocathode sensitivity was plotted with the aid of a Pu-239 spectrometric point source. The apparatus used for measuring the concentration of natural radioactive aerosols by spectrometric methods is described. (See also W75-04054) (Houser-ORNL)
W75-04098

ISOTOPE ANALYSIS OF RADIOACTIVE FALLOUT AND AEROSOL SAMPLES BY BETA-SPECTROMETRY,
A. N. Silant'ev, T. V. Polyakova, F. A. Rabotnova, and I. G. Shkuratova.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 310-314, 2 fig, 2 ref.

Descriptors: *Radioisotopes, *Measurement, *Instrumentation, *Design criteria, Radium, Praseodymium, Yttrium, Strontium, Analytical techniques, Methodology, *Spectrophotometry, *Pollutant identification.

Discussed is a method for determining the content of radium-106, praseodymium-144, yttrium-90, and strontium-89 isotopes by beta-spectrometric analysis, involving the use of a scintillation beta-spectrometer with a plastic 20-mm-thick scintillator of 70-mm diameter. Only beta radiation of energies above 630 keV is taken into account when processing spectra. The measured spectra in the range of 630 keV to 3.5 MeV are subdivided into intervals so that a system of equations holds. (See also W75-04054) (Houser-ORNL)
W75-04099

RAPID SYSTEM OF AUTOMATIC PUNCH-TAPE OUTPUT OF INFORMATION FROM THE AI-100-1 ANALYZER,
N. F. Mazurin, V. P. Solov'ev, and V. N. Churkin.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 315-318, 2 fig, 1 ref.

Descriptors: *Radioisotopes, *Measurement, *Instrumentation, *Design criteria, Methodology, Remote sensing, Automation, Data collections, Data transmission, Geophysics.
Identifiers: *Multichannel analyzer, Gamma-spectrum.

Described is the SAPAR-1m system of automatic punch-tape output of information from a 'Raduga' (AI-100 -- 1) multichannel amplitude analyzer of pulses in the code of the 'Minsk-2' or 'Minsk-22' computer. The block diagram of the system includes an AU-100 -- 1 analyzer, a code-conversion and puncher-control circuit, and a PL-80 tape puncher. In contrast to earlier setups, the code-conversion and puncher-control circuit is transistorized, and thus faster and more reliable The top speed of the SAPAR-1m entirely depends on the top speed of the puncher; with the PL-800 puncher, it attains 12 channels per second. Automatic punching of measurement data, combined with machine processing of amplitude spectra on the 'Minsk-22' computer, has almost completely eliminated manual operations from gamma-spectrum processing. (See also W75-04054) (Houser-ORNL)
W75-04100

GRAPHOANALYTICAL METHOD FOR DETERMINING CESIUM-137 CONCENTRATION IN SOIL SAMPLES FROM THE GAMMA SPECTRUM,
V. N. Churkin.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 319-334, 6 fig, 3 tab, 12 ref.

Descriptors: *Soil contamination, *Cesium, *Measurement, *Radiation, Analytical techniques, Design criteria, Remote sensing, Aircraft, *Spectrophotometry, *Pollutant identification.
Identifiers: Gamma spectrum.

The high-energy part of the amplitude distribution of pulses in the region of the Cs137 photopeak of 680-740 keV is shown to be fairly well approximated by a Gaussian curve, if the Cs137 photopeak in the gamma spectrum of the soil samples is separated from the right-hand base of the curve 'parallel to the level of the natural background.' This facilitates graphoanalytical determination of the Cs137 photopeak area along with calculation of the concentration of this isotope in the soil. Components due to interfering radiation of natural and artificial isotopes need not be taken into account. The threshold sensitivity for a 50% statistical error of measurement is 2 times 10(-13) curie/g. The method is five to eight times as efficient as known methods. It is assumed that it also applies to measurements in situ, e.g., when Cs137 concentration in the soil cover is investigated from aboard aircraft or automobiles. (See also W75-04054) (Houser-ORNL)
W75-04101

RADIOCHEMICAL METHOD OF DETERMINING LOW STRONTIUM-90 CONCENTRATION LEVELS IN ENVIRONMENTAL SAMPLES,
V. B. Chunichev.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 335-339, 8 ref.

Descriptors: Analytical techniques, Measurement, *Assay, *Strontium, *Sea water, *Radiochemical analysis, Sampling, Environment, Efficiencies, *Pollutant identification.

A radiochemical method for determining Sr90 in 10 liters of seawater is described in detail. It involves a low-background radiometric setup (background of 4 to 6 counts per hour), intended for measuring the beta-radiation of the daughter Y90. The method significantly facilitated the taking and preliminary processing of seawater samples, reduced the consumption of reagents such as soda and hydrochloric acid, eliminated the use of ammonium chloride, and increased the relative yield of strontium. Analysis of the carbonate concentrate became three times as efficient as analysis of the concentrate from a 100-liter sample. Sr90 can be determined in 2-liter seawater samples without a flame photometer. The method was also used to study the sea bottom, at Sr90 concentration levels of 10(-12) curie. STUDY OF THE RESISTANCE OF FIBROUS FILTERING MATERIALS IN RAREFIED AIR,
I. V. Petryanov, B. I. Ogorodnikov, and L. A. Zimina.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 353-357, 2 fig, 2 tab, 7 ref.

Descriptors: Research and development, *Filters, *Filtration, *Porous media, Compaction, *Resistance, *Flow resistance, Equations, Mathematics, Viscosity, Viscous flow, Gases, Air.
Identifiers: Filter fibers.

The resistance of fibrous FP filtering materials in a flow of rarefied air is studied. The material resistance Delta p was found to decrease with increasing length Lambda of the mean free path of the gas molecules, because the gas flow glides along the filter fibers, and at normal atmospheric pressure the resistance of almost all FP materials is already lower than its maximum. For FPP-5, LFS-2, and FPP-15 materials, which consist of ultrafine fibers, the loss of resistance is 10-20%. Higher compaction Beta leads to a slight additional drop in resistance from the maximum for the given compaction. The resistance of FP materials under gliding flow conditions can be computed. NATURAL SNOWFLAKE RADIOACTIVITY DUE TO SHORT-LIVED RADON DECAY PRODUCTS,
A. S. Avramenko, and K. P. Makhon'ko.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 361-371, 8 tab, 10 ref.

Descriptors: *Meteorology, *Snow, *Radiation, *Assay, *Measurement, *Radon, Sampling, Mass, Precipitation(Atmospheric), Aerosols, Clouds, Coagulation.
Identifiers: *Snowflakes, Specific radioactivity

Discussed is snowflake radioactivity due to short-lived products of radon decay. Nuclear photoplatex of the A-2 type were used as indicator. Of the 3106 snowflakes measured, 1270 were radioactive. The frequency of the specific radioactivity of snow flakes has two maxima, at C = 0 and

at C = 16 to 32 times 10(3) alpha-tracks per gram, and one minimum at C = 4 to 8 times 10(3) alpha-tracks per gram. The number of nonradioactive snowflakes and the specific snowflake radioactivity decreases with increased snowflake mass. A scheme for the radioactivation of snowflakes in order to examine the patterns obtained is also discussed. The coagulation constant of radioactive aerosols with the cloud element is assessed from experimental data on the number of nonradioactive snowflakes. (See also W75-04054) (Houser-ORNL)
W75-04107

TRACE ELEMENTS AND NATUR RADIOACTIVITY IN CLOUD WATER AND ATMOSPHERIC PRECIPITATION IN THE CENTRAL CAUCASUS MOUNTAINS,
E. P. Makhon'ko, A. S. Avramenko, and K. P. Makhon'ko.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 372-379, 5 tab, 14 ref.

Descriptors: *Meteorology, *Radioisotopes, Measurement, *Atmosphere, *Precipitation(Atmospheric), *Clouds, *Trace elements, Climatology, Fallout, Sampling, Air, Water chemistry, Aerosols, Particle size.

Total concentrations of short-lived radon decay products in precipitation, cloud water and air were measured in summer on the Terskol peak of the Central Caucasus, along with the concentrations of Fe, Pb, Mn, Ni, and Mg. The precipitation samples were taken in polyethylene vessels, the cloud-water samples were taken with the aid of a battery of four parallel cyclones, while the atmospheric aerosol samples were taken by means of a filtering setup with an FPP-15-1.5 filter. The admixture concentrations obtained are similar in the precipitation and the cloud water, as are the corresponding coefficients of admixture concentration (concentration ratios of water to air), i.e., the contamination of precipitation takes place mainly in the cloud. The assessed 'lifetime' of the trace elements in the atmospheric layer subjected to precipitation washout (1.4 days), concentration coefficient (6 times 10 to the 5th power), and rate of 'wet precipitation' (1.2 km/day) correspond approximately to the values for natural radioactivity (2 times 10 to the 5th power and 0.8 km/day), and with literature data for macroelements and nuclear explosion products. This is an indication that the aerosol carriers of these admixtures in the atmosphere have similar properties, mainly similar particle sizes. (See also W75-04054) (Houser-ORNL)

AN AUTOMATED METHOD FOR THE DETERMINATION OF FORMALDEHYDE IN SEWAGE AND SEWAGE EFFLUENTS,
Water Pollution Research Lab., Stevenage (England).
C. C. Musselwhite, and K. W. Petts.
Water Pollution Control, Vol 73, No 4, p 443-448, 1974. 4 fig, 7 tab, 3 ref.

Descriptors: *Sewage, *Analytical techniques, *Monitoring, *Water quality control, Boating, Water pollution sources, Boats, Boating regulations, *Automation, *Pollutant identification, Analytical techniques.
Identifiers: *Formaldehyde, Technicon Auto analyzer.

The discharge of sewage from pleasure boats has been cited as an increasing source of pollution. Control of this discharge requires the mandatory use of chemical toilets which will be discharged for treatment ashore, probably to be treated in combination with other sewage. Since some of the chemical additives to the toilets contain a high proportion to formaldehyde, which is toxic to some fish at levels above 50 mg/liter, it is necessary to know the formaldehyde content of this treated sewage before it is discharged to water. A procedure is described for using a Technicon Auto Analyzer to quickly and accurately monitor the formaldehyde level. The mehtof utilizes the reaction of formaldehyde with acetylacetone in the presence of an excess of an ammonium slat to form a yellow compound, diacetyldihydrolutidine, whichis measured colorimetrically. The methods outlined will give reproducible results in the range of 0.10 to 25.0 mg/liter of free and combined formaldehyde and in the range of 0.05 to 10.0 mg/liter of distilled formaldehyde. It is proposed that the automated processes should be used for the routine monitoring of total formaldehyde present in sewage and sewage effluents. (Orr-FIRL)

NEW SPECTROPHOTOMETRIC METHOD FOR THE ESTIMATION OF HEXAVALENT CHROMIUM IN WATER,
Indian Defence Research and Development Establishment, Gwalior.
R. Prasad, and S. Ramanujam.
Research and Industry, Vol 19, No 1, p 26-29, March, 1974. 1 fig, 7 tab, 6 ref.

Descriptors: *Spectrophotometry, *Chromium, *Toxicity, Water pollution, Water quality standards, Metals, Water quality control, *Pollutant identification, Analytical techniques, Potable water.
Identifiers: *Hexavalent chromium, O-tolidine hydrochloride-tartaric acid reagent, Analar potassium dichromate, Sodium fluoride, Beer's Law.

The blue color developed with O-tolidine hydrochloride-tartaric acid reagent in the presence of aqueous sodium fluoride, is the basis for a quantitative method for the spectrophotometric evaluation of hexavalent chromium in drinking water at 600 millimicrons. Hexavalent chromium is a toxic inorganic element in potable water. The maximum amount permissible is 0.05 ppm. The standard hexavalent chromium solution consists of the dissolving of 0.1414 g Analar potassium dichromate in distilled water, making the volume up to 100 ml. Twenty ml of this solution were made up to 1000 ml to create the standard solution consisting of one microgram hexavalent chromium per ml. O-tolidine hydrochloride tartaric acid was prepared by dissolving 0.5 g freshly prepared pure O-tolidine hydrochloride and 0.5 g pure tartaric acid in distilled water, making a volume of 100 ml. One g pure sodium fluoride dissolved in water made up to 100 ml and kept separately. The null balance method in a one centimeter cell of Unicam SP 500 series 2 ultraviolet and visible spectrophotometer in the visible range utilizing tungsten lamp was used to determine the optical density measurements. The hexavalent chromium solution was treated with one ml of O-tolidine hydrochloride-tartaric acid reagent and one ml of sodium fluoride solution, making up to 10 ml with distilled water. The blue color was stable for about one hour. The solution was measured in the spectrophotometer for 26 to 30 minutes at wavelengths ranging from 400 to 650 millimicrons. (Leibowitz-FIRL)

DICHROMATE RELUX CHEMICAL OXYGEN DEMAND: A PROPOSED METHOD FOR CHLORIDE CORRECTION IN HIGHLY SALINE WASTES,
Jacobs Engineering Co., Pasadena, Calif.
F. J. Baumann.
Analytical Chemistry, Vol 46, No 9, p 1336-1338, August, 1974. 1 fig, 3 tab, 4 ref.

Descriptors: Water pollution control, Salinity, *Chlorides, Waste water treatment, *Oxidation, *Chemical oxygen demand, *Saline water, *Pollutant identification.
Identifiers: *Dichromate reflux method, Mercuric sulfate, Chloride oxidation, Saline wastes.

Chloride interferes with methods which attempt to determine chemical oxygen demand by strong wet oxidative means in saline wastes. Mild oxidizing conditions inhibit chloride oxidation, but only at the expense of inefficient oxidation of organic matter. In the determination of COD the dichromate reflux method uses acid concentrations and heating times which oxidize about 85-95 percent of the organic matter present, while oxidizing the chloride ion 100 percent as well. The chloride interference can be greatly inhibited through the addition of mercuric sulfate to form unionized mercuric chloride. The complexing method using a weight ratio of HgSO4:Cl at 10:1, yields reproducible results at chloride concentrations up to 5,000 mg/liter. Chloride interference problems occur in wastes of low to moderate COD with chloride concentrations approaching that of seawater. True values for oxygen consumed from dichromate are determined in highly saline wastes and seawater by the employment of the chlorine-recovery method, without the requirement of prior chloride determination or dependence on an excess of mercury which does not achieve complete sequestration of chloride. DATA NEEDS FOR THE ASSESSMENT OF POPULATION DOSE FROM BACKGROUND RADIATION,
Health and Safety Lab. (AEC), New York.
W. M. Lowder, J. H. Harley, and J. E. McLaughlin.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tenn., p 23-29, 3 tab, 9 ref.

Descriptors: *Human population, *Radioactivity, *Public health, *Basic data collection, *Background radiation, Measurement, Analytical techniques, Assessment, Assay, Safety, Evaluation, Radon, Gamma rays.
Identifiers: *Dose.

In the course of preparation of two National Council on Radiation Protection and Measurement (NCRP) reports on the dose to the U.S. population from background radiation and on techniques of measurement, several significant sources of uncertainty that are relevant to all studies of human population exposure to this background have been identified. These include (1) the extremely limited data on gamma radiation and airborne radon levels in the indor environment and their dependences on the properties and radionuclide contents of building materials; (2) possible inadequacies in the models used to relate radiation or radionuclide measurements to human organ dose; and (3) possible uncertainties in the dose contributions of cosmic ray charged particles (ca 10 percent). In addition, the need for considerably more detailed information on the time variations of the various components of background radiation is relevant to the quantitative assessment of small additions to the overall radiation exposure produced by man-made radionuclides in the environment. These considerations become more critical when realistic population dose estimates are desired for a limited geographic region, particularly a highly urbanized area. In most such situations, reasonably extensive measurement programs would be required. Existing information on typical radionuclide dis-

tributions, radiation fields, and component doses such as is contained in forthcoming NCRP reports would provide useful guidance in the design of such programs. (See also W75-04152) (Houser-ORNL)

THE USE OF AN AUTOMATED POPULATION DATA BASE IN POPULATION EXPOSURE CALCULATIONS,
Office of Radiation Programs, Silver Spring, Md. Electromaganetic Radiation Analysis Branch.
T. W. Athey, R. A. Tell, and D. E. James.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tenn., p 29-36, 4 tab, 3 ref.

Descriptors: *Human population, *Radioactivity, *Measurement, *Computer programs, Geography, Census, Fuels, Mathematics, Assessment.
Identifiers: *Population exposure, Radioactivity release, Dose calculations, Fuel cycle, Nonionizing radiation, Fuel reprocessing.

The assessment of potential hazard to the population from a source in the environment often requires a knowledge of the specific geographic population distribution around the source. A computer program package and data base, developed primarily for marketing purposes in the U.S. Department of Commerce, were adapted for use in a number of population exposure problems in the ionizing and nonionizing radiation areas. The data base consists of the U.S. Census Bureau Master Enumeration District List with coordinates. For each of the 250,000 census enumeration districts (CEDs), the total population and housing units, the state and county code, and the latitude and longitude of the population centroid are given. The average population in a CED is 800, and this is approximately the limit of resolution of the data base. The programs generate the total population within selected distances and angular sectors from a reference point designated by its geographic coordinates. Alternately, the programs can be used as subroutines to make available to another program the distance and bearing of each CED, in a selected region, from a reference point. The potential applications to the population exposure problem are many and examples briefly discussed include single-source discharge from facilities in the nuclear fuel cycle and exposure from nonionizing radiation sources such as radio, television, radar, and microwave transmitters. An an example of the use of this population distribution system, the population exposure from AM radio standard broadcast station is discussed in detail. (See also W75-04152) (Houser-ORNL)

THE USE OF ENVIRONMENTAL MONITORING DATA IN DETERMINING BACKGROUND RADIATION DOSES,
Health Physics Society, East Weymouth, Mass.
S. M. Garry, W. H. Wilkie, B. B. Hobbs, H. J. Monroe, and R. G. Wallace.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tenn., p 37-44, 3 tab, 13 ref.

Descriptors: *Nuclear powerplants, *Radioactivity, *Measurement, *Assessment, Background radiation, Monitoring, Environment, Air pollution, Water pollution, Soil contamination, Food chains, Path of pollutants, Gamma rays.
Identifiers: *Doses, *Population exposure, Cosmic radiation.

Comparison of background radiation doses reported in the literature with doses calculated from preoperational environmental monitoring data indicates in general, that monitoring data can be used to estimate doses to individuals from background radiation. These procedures for estimating doses provide a basis for assessing any significant increase in dose that may result from the operation of a nuclear power plant. Doses to individuals from background radiation are estimated from preoperational environmental monitoring data for a nuclear power plant. Food categories, consumption rates, and dose commitment factors are listed; and the calculation of doses to individuals from radioactivity in the environment is described. Sample collection and laboratory procedures are described briefly. Models of ingestion, air submersion, inhalation, and ground concentration pathways are used to calculate the doses from 16 radionuclides. Ingestion doses are estimated from measured radionuclide concentrations in 10 food categories that represent the major portion of the human diet. Doses from air submersion and inhalation pathways are estimated from measurements of radionuclide concentrations in air. Doses received from terrestrial radioactivity are calculated from measurements of radionuclide concentrations in soil. Thermoluminescent dosimeters are used to estimate the total external background gamma doses, including doses received from cosmic radiation. (See also W75-04152) (Houser-ORNL)
W75-04158

ENVIRONMENTAL RADIATION MEASUREMENTS USING IN SITU AND CORE SAMPLING TECHNIQUES,
Oak Ridge National Lab., Tenn.
H. W. Dickson, G. D. Kerr, P. T. Perdue, and S. A. Abdullah.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, 1974, Knoxville, Tennessee, p 45-52, 2 fig, 3 tab, 7 ref.

Descriptors: *Environment, *Radioactivity, *Measurement, *Assessment, Analytical techniques, Sampling, Cores, Instrumentation, Gamma rays, Cesium, Computer program, Soils, Soil contamination, Distribution.
Identifiers: *In-situ measurements, *Dose rate.

Dose rates from natural radionuclides and 137Cs in soils of the Oak Ridge area have been determined from in situ and core sample measurements. In situ gammaray measurements were made with a spectrometer consisting of a 4096 channel analyzer and a 55 cm3 Ge(Li) detector designed for this purpose. This equipment was transported in a mobile laboratory constructed in a large van that had a gasoline generator to provide electrical power at remote sites. A tape of spectral data and a soil core sample from each site were returned to ORNL for further analysis. Information on soil composition, density, and moisture content, and on the distribution of cesium in the soil was obtained from the core samples. Measurements of radionuclide concentrations in soil samples were made with a 4 x 4 inch NaI detector that was in a graded shield and shielded counting room. In situ spectra were analyzed by a computer program which identified and assigned energies to peaks, integrated the areas under the peaks, and calculated radionuclide concentrations based on a uniform distribution in the soil. The assumption of a uniform distribution was adequate only for natural radionuclides, but simple corrections can be made to the computer calculations for man-made radionuclides distributed on the surface or exponentially in the soil. For 137Cs, a correction was used based on an exponential function fitted to the distribution measured in core samples. At typical sites in Oak Ridge, the dose rate determined from these measurements was about 5 urad/hr. (See also W75-04152) (Houser-ORNL)
W75-04159

ENTRAINMENT OF STRATOSPHERIC TRITIUM: ANOTHER RADIOLOGICAL ANOMALY OF THE ROCKY MOUNTAIN WEST,
NUS Corp., Rockville, Md.
S. T. Bard.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 73-79, 3 fig, 2 ref.

Descriptors: Nuclear powerplants, *Radioactivity, *Monitoring, Surveys, *Tritium, Nuclear explosions, *Air pollution, Water pollution, Meteorology, Migration, *Rocky Mountain region, *Waste vapor.
Identifiers: *Surveillance program, Fort St. Vrain(Colo), Maximum permissible concentration.

A pre-operational radiological surveillance program for the Fort St. Vrain Nuclear Generating Station has detected a source of population exposure unique to the Colorado front range. It was found that tritium concentrations in atmospheric water vapor could fluctuate by three orders of magnitude over a twenty-four hour period and may attain MPC levels for short intervals of time following a high yield thermonuclear atmospheric test. The results also substantiate the work of other investigators who have suggested that orographically induced atmospheric waves can significantly alter the height of the tropopause in the lee of the mountains and allow for the rapid transport of stratospheric air to the ground suface. AS LOW AS PRACTICABLE: A CRITICAL APPRAISAL OF POPULATION HEALTH RISKS FROM POWER PLANT EFFLUENTS,
Brookhaven National Lab., Upton, N.Y.
A. P. Hull.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 161-172, 1 fig, 1 tab, 37 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Radioactivity, *Water pollution, *Air pollution, *Liquid wastes, *Public health, Food chains, Population, Assessment, Risks, Human population, Environmental effects, Mortality, Safety, Evaluation, Model studies.

A public controversy about the risks from radioactivity in effluents from nuclear power plants arose in the late 1960's as their utilization was growing toward large-scale commercial basis. Several scientific critics alleged variously that the existing plants had occasioned excess infant mortality in their vicinities, and that the growth of nuclear power would produce large increases in the cancer death rate in the general population. The controversy occasioned by these allegations led the Federal Radiation Council to instigate the Biological Effects of Ionizing Radiation (BEIR) Committee review of the effects of exposure to low levels of ionizing radiation. It also appeared to underlie the AEC's 10 CFR 50 Appendix I proposals for numerical limits for nuclear power plant effluents. These proposals are intended to limit the exposure of any nearby individual to 5 mR/yr, and thereby would assure that the total population would be exposed to less than about 400 person-rems per year per 1,000 Mw(e) installed capacity. This critical review indicates that the critics' allegations were either without substance or irrelevant. Using BEIR estimates of the risks from radiation and recent years effluent release data, the population health risk from power reactor effluent radiation exposures appears to be generally smaller than that from fossil-fueled plant effluents. The BEIR estimates are based on the linear no-threshold hypothesis. Growing evidence suggests that this hypothesis is excessively conservative, when applied to low dose levels such as those occasioned by routine nuclear power plant effluents. Insofar as this is so, the benefits of the Appendix I proposals to reduce population exposures appear to be correspondingly exaggerated. (See also W75-04152) (Houser-ORNL)
W75-04163

DETERMINATION OF GAMMA-RAY EXPOSURE IN THE VICINITY OF A BOILING WATER POWER REACTOR,
Atomic Energy Commission, New York, New York. Health and Safety Laboratory.
C. V. Gogolak, and K. M. Miller.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 207-214, 3 fig, 2 tab, 17 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Noble gases, *Meteorology, *Population, *Radioactivity, *Model studies, Measurement, Data collection, Ion transport, Analytical techniques, Operations, Evaluation, Assessment, Public health.
Identifiers: Release rate, Gaussian Models, Dose.

Calculations of gamma-ray exposure due to the noble gas effluent of a boiling water power reactor have been made using a Gaussian plume exposure model. Hourly meteorological data and daily average release rate data gathered on site were used as input to the model. Simultaneous measurements were made with continuously-monitoring ionization chambers at seven locations between 1.3 and 8.0 km from the reactor stack for more than eight months of reactor operation to evaluate the model results. Having established the reliability of the calculations for determining exposure rates lower than 1 mR per year, estimates of the population exposure to a distance of 16 km from the plant were made. Problems involved in extending such calculations to population dose assessment are discussed. (See also W75-04152) (Houser-ORNL)
W75-04168

EFFECT OF STACK HEIGHT ON INDIVIDUAL AND POPULATION DOSES ATTRIBUTABLE TO GASEOUS EFFLUENTS FROM A MODEL FUEL REPROCESSING FACILITY,
Oak Ridge National Lab., Tenn.
L. R. McKay, and J. P. Witherspoon.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 223-228, 1 tab, 10 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Radioactivity, *Gases, particles, Waste dilution, Dispersion, Population, Public health, Toxicity, Tritium, Krypton, Assessment, Safety, Evaluation, Computer models, Computer programs.
Identifiers: Dose, Fuel reprocessing, *Population exposure, *Stack height, Comparisons.

The importance of stack height to provide sufficient atmospheric dilution for radioactive particles and gases in emissions from nuclear facilities has long been recognized. To assess the influence of stack height on radiation doses attributable to gases and particles in airborn emissions from a model fuel reprocessing facility, a plant typical in terms of source term, technology, location, and surrounding population was selected. A computer code was used to predict atmospheric and ground concentrations of radionuclides out to 55 miles and to estimate dose from both external and internal exposure modes. A stack height of 100 meters was selected as the base line case, and heights of 75, 50, and 20 meters were used to estimate the effect on maximum individual dose and on population dose within 55 miles of the model facility. When a 20-meter stack height was assumed, the maximum dose to an individual was 18 times that estimated for a 100-meter stack. The corresponding population dose out to 55 miles, however, was only 1.6 times greater for the shorter stack. The maximum dose to an individual attributable to the gases tritium and krypton-85 was reduced 20-fold in increasing stack height from 20 to 100 meters. The corresponding decrease in the particulate fraction was only about 10-fold. At 55 miles, estimates of population dose varied from 668 (20-meter stack) to 414 (100-meter stack) man-rems/year. Stack height had little effect on population dose, 95% of which was attributable to the gases tritium and krypton-85. (See also W75-04152) (Houser-ORNL)

C-14 GASEOUS EFFLUENT FROM PRESSURIZED WATER REACTORS,
New York State Dept. of Health, Albany. Radiological Sciences Lab.
C. Kunz, W. E. Mahoney, and T. O. Miller.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p. 229-234. 2 tab, 8 ref.

Descriptors: Industrial production, *Nuclear powerplants, *Effluents, *Gases, Carbon, *Assay, Assessment, Radioactivity, Toxicity, Public health, Analytical techniques, Gas chromatography, Oxygen, Nitrogen, Neutron absorption, Ecology.
Identifiers: *Carbon-14 gases.

Samples of decay tank gas and containment air were obtained from the three operating pressurized water reactors in New York State: the Ginna reactor in Rochester and Indian Point Unit 1 and Indian Point Unit 2 in Buchanan. These samples, taken over the past two years, were analyzed for carbon species by chromatographic separation. The 14C activity of the individual compounds was measured by gas proportional counting. In all the samples analyzed, CH4 and C2H6 contained over 80% of the 14C activity, with lesser activities observed for higher hydrocarbons and CO2. Although the fission product activity in gaseous effluents varied with fuel rod integrity, the production of 14C remained relatively constant. The results indicate that it is produced predominantly in the reactor vessel by the reaction of neutrons with nitrogen and oxygen in the primary coolant. The total yearly gaseous effluent of 14C for a 1,000 MWe pressurized water reactor is estimated to be approximately 6 Ci. (See also W75-04152) (Houser-ORNL)
W75-04171

MEASUREMENT OF ABSORBED FRACTIONS FOR PHOTON SOURCES DISTRIBUTED UNIFORMLY IN VARIOUS ORGANS OF A HETEROGENEOUS PHANTOM,
Oak Ridge National Lab., Tenn.
S. M. Garry, P. S. Stanbury, and J. W. Poston.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 251-258. 2 fig, 3 tab, 10 ref.

Descriptors: Research and development, *Model studies, *Research facilities, Mathematics, *Measurement, Absorption, Radioactivity effects, Food chains, Water, Milk, Foods, Cesium, Cobalt.
Identifiers: *Dose, Phantom.

A physical representation of the Snyder-Fisher mathematical phantom has been designed and constructed. The physical phantom contains skeletal components, lungs, and soft-tissue regions similar to the mathematical Snyder-Fisher phantom. The phantom is suitable for studies of radiation distributions involving both internally and externally applied radiation fields. The phantom and its composition are described. Dose distributions were measured within the phantom resulting from photon emitters distributed uniformly in selected organs. These distributions were used to calculate absorbed fractions for the mathematically defined phantom organs. These absorbed fractions are given and compared with the absorbed fraction estimates by Snyder, et al. In general, estimates of the absorbed fractions, obtained experimentally, fall within the range of twice the standard deviation of the calculated value. (See also W75-04152) (Houser-ORNL)
W75-04173

DECAY SCHEME DATA FOR RADIATION DOSE CALCULATIONS,
National Environmental Research Center, Las Vegas, Nev.
B. J. Mann.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 259-266. 1 fig, 1 tab, 14 ref.

Descriptors: Nuclear powerplants, Effluents, *Radioactivity, Radioactivity effects, *Human population, Toxicity, Public health, Safety, Evaluation, Radioisotopes, Research and development, Research facilities.
Identifiers: *Dose calculations, Decay schemes.

Safety and environmental impact assessments of nuclear projects include calculations of expected radiation doses to individuals and population groups under a variety of circumstances. These calculations require detailed decay data from all individual radionuclides of interest. These data include half-lives or decay constants, decay modes and branching ratios, and energies and absolute intensities of all radiation emitted. A compilation of radiation energies and absolute intensities from the decay of radionuclides produced in light water power reactors has been initiated. This is primarily based on data provided by the Lawrence Berkeley Table of Isotopes Project and, to a lesser extent, on the publications of the Oak Ridge Nuclear Data Project. This effort has encountered a number of difficulties in development of a complete file of the best values for each of the decay parameters. These Problems are discussed and data needs for dose computations are examined. It is proposed that a comprehensive, computerized decay data file be developed and maintained by a qualified group or organization. (See also W75-04152) (Houser-ORNL)
W75-04174

THE EFFECT OF DEPOSITION VELOCITIES ON ESTIMATES OF ENVIRONMENTAL TRANSPORT AND POPULATION DOSES,
Oak Ridge National Lab., Tenn.
R. E. Moore, and S. V. Kaye.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 283-288. 2 tab, 6 ref.

Descriptors: *Nuclear powerplants, Nuclear reactors, *Effluents, *Environment, Meteorology, *Ion transport, *Radioactivity, Assessment, Evaluation, Velocity, Food chains, Radioisotopes, Public health, Research and development, Sites.
Identifiers: Particles, Deposition, Population exposure, Doses.

Uncertainties in values used for deposition velocities of particulate radionuclides released to the atmosphere by nuclear facilities have led to uncertainties in estimated population doses. A computer study of 33 radionuclides, assumed to be released as particles from a liquid metal fast breeder reactor (LMFBR) fuel reprocessing plant, was designed to evaluate the sensitivity of estimated doses to selected values for deposition velocities. Deposition velocities were varied from 0.1 to 10 cm/sec, which is approximately the range found in the literature for the few measurements that have been reported. Atmospheric dispersion from a 100-meter stack was estimated for the average annual meteorological conditions of 18 reactor sites in the United States. A uniform population distribution within a 50-mile radius of the plant was assumed. Increasing the deposition velocity increases the dose through ingestion of food produced in the area and the dose through exposure to contaminated land surfaces, but decreases the inhalation and immersion doses. The deposition velocity for each radionuclide was determined to give the average of the minimum and maximum doses (for whole body and for reference organs) computed over the range of deposition velocities used in this

study. Nearly all of the values fall within the range 0.7 to 1.35 cm/sec, with most close to 1 cm/sec. The use of these values assures that doses would not be underestimated by more than 50%. The uncertainties for whole body dose range from plus or minus 4 to plus or minus 99%; the majority is greater than plus or minus 80%. Uncertainty limits for a total facility release can be assigned by weighting dose uncertainties for the specific radionuclides by their release rates to the environment. LOW LEVEL POPULATION EXPOSURE MEASUREMENTS USING THERMOLUMINESCENT DOSIMETERS,
Eastern Environmental Radiation Facility, Montgomery, Ala.
J. E. Partridge, J. A. Broadway, S. T. Windham, and C. R. Phillips.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 289-296. 4 fig, 2 tab, 7 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Radioactivity, Measurement, *Assay, Assessment, Human population, On-site data collections, On-site investigations, On-site tests, Evaluation, Standards, Instrumentation, Meteorology.
Identifiers: *Dosimetry, *Population exposure, Thermoluminescence dosimetry, Stack releases.

The Eastern Environmental Radiation Facility's (EPA) experience with calcium fluoride:manganese thermoluminescent dosimeters (TLD) is described. The information gained from earlier laboratory studies was applied to a thorough field evaluation of this type dosimeter. The objective of this field evaluation was to determine the usefulness of this TLD for making population exposure measurements in the range of proposed 10CFR50, Appendix I, limits. The results of a ten month investigation at an operating boiling water reactor site are given. Simultaneous TLD and pressurized ionization chamber measurements were made at several locations near the site boundary for the length of the study. The integrated exposure as recorded by the TLD is compared with the results obtained using ionization chambers. The TLD measurements are also compared to mathematical predictions for each site. The mathematical predictions were made using the AIREM code and plant supplied stack release and meteorological data. (See also W75-04152) (Houser-ORNL)
W75-04178

FIELD TESTING OF TSEE DOSIMETERS FOR PERSONNEL MONITORING,
Oak Ridge National Lab., Tenn.
R. B. Gammage, J. S. Cheka, and N. Saheli.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 297-304. 4 fig, 3 tab, 11 ref.

Descriptors: *Monitoring, *On-site tests, *Instrumentation, *Radioactivity, On-site data collections, Evaluation, Assessment, Research and development.
Identifiers: *Dosimeters, *Dosimetry, Personnel monitoring, Comparison, Ion chamber, Film, Thermoluminescence.

Generally successful field tests using thermally stimulated exoelectron emitting (TSEE) type dosimeters for personnel monitoring have been conducted for periods of between one day and one year and at exposures of gamma radiation ranging from essentially background level to about 100 mR/day. Performance is less satisfactory during the hottest and most humid weather of the year in Tennessee when fading is significant during three-month long exposures. Comparison with data from film, TLD and ionization chambers is satisfactory taking into account the variety of filter and absorber thicknesses used. A superior performance by the TSEE dosimeters is indicated where weaker penetrating radiations are present. The energy and angular dependence characteristics are very favorable for the purposes of X- and y-ray dosimetry. For the task of personnel monitoring, the following have been developed: a manual reader with good reproducibility for semi-routine use, a lightproof badge, and sensitive but stable BeO ceramic dosimeters. ESTIMATION OF THE DOSE EQUIVALENT TO THE U.S. POPULATION FROM RADON IN LIQUIFIED PETROLEUM GAS,
Texas Univ., Houston. School of Public Health.
T. F. Gessell.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 347-354, 3 tab, 15 ref

Descriptors: *Radioactivity, *Measurement, *Radon, *Gases, *Natural Gas, *Human population, Public health, Estimating.
Identifiers: Doses, Estimating, Population exposure, Demography, Census, Dosimetry

Previous publications of the radiological health aspects of 222Rn in liquified petroleum gas (LPG) have reported measurements of 222Rn concentrations in LPG at the consumer level in 14 states and estimates of the resulting dose equivalents to the bronchial epithelium of individuals under hypothetical circumstances. In this paper the measured 222Rn concentrations in LPG are incorporated with information on the production and distribution of LPG to estimate an average 222Rn concentration in LPG for each state. These estimates, together with weather, demographic, and LPG consumption data are used to estimate the population dose equivalent to the bronchial epithelium of the general population from this source of 222Rn. The results are compared with the estimated population dose equivalent due to 222Rn in natural gas and due to 222Rn present naturally in the atmosphere. (See also W75-04152) (Houser-ORNL)

RADIATION DOSE FROM NATURAL GAS VS. THAT FROM NUCLEAR STIMULATED NATURAL GAS,
Georgia Inst. of Tech., Atlanta. Office of Interdisciplinary Programs.
M. W. Carter, and A. A. Moghissi.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 355-360, 1 tab, 10 ref.

Descriptors: *Radioactivity, *Radiation, *Radon, *Gases, *Tritium, *Krypton, Natural resources, *Natural gas, Consumptive use, Human population, Public health, Secondary recovery(Oil).

Natural gas contains radon and its daughter products which contribute to the population dose. Nuclear stimulated gas may also contain tritium and krypton-85 as contaminants. It is possible to compare radiation dose from radon with that from tritium and krypton-85 using various methods. Results are described of such a comparison based on previous experiments with tritiated natural gas. (See also W75-04152) (Houser-ORNL)

LARGE SCALE NUCLEAR GAS STIMULATION: POPULATION DOSES ESTIMATED IN THE ENVIRONMENTAL ASSESSMENT OF CARBON-14 RELEASES,
Oak Ridge National Lab., Tenn.
P. S. Rohwer, C. J. Barton, and R. E. Moore.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 361-368, 1 tab, 15 ref.

Descriptors: *Secondary recovery(Oil), *Natural gas, *Radioactivity, *Radioisotopes, *Nuclear explosions, Carbon, Environment, Pollutants, Estimates, Assessment, Human population, Public health, Fossil fuels.
Identifiers: *Doses, *Carbon-14.

Carbon-14 is present principally as 14CO2 and 14CH4 in natural gas from wells stimulated with nuclear explosives. The 14CO2 probably would be removed and released to the atmosphere at a processing plant before the gas is introduced into a transmission system supplying users. The 14C present as 14CH4 and other 14C hydrocarbons will be released, also as 14CO2, at the point of gas combustion. The hypothetical situation considered is a model field of 1200 nuclearly stimulated wells developed over a 30-year period, each well releasing ultimately 2 Ci of 14C as 14CO2. Doses to individual gas users, to a local population, and to the world population were estimated. Inhalation of 14CO2 in home exposure to gas combustion products from an unvented kitchen range is estimated to result in an annual total-body dose to the resident of 0.005 millirem. The annual population dose due to 14CO2 inhalation estimated for 1.42 million people living within 50 miles of a gas processing plant is 0.06 man-rem, with a maximum individual dose of 0.01 millirem and an average of 0.00004 millirem. Assuming zero population growth, the resulting population dose commitment is 120 man-rems for the entire world. These estimated population dose commitments are shown to be less than 10% of the population doses received annually from natural 14C. The present rate of burning 14C-free fossil fuels results in a theoretical annual reduction in the specific activity of 14CO2 in the troposphere (Suess Effect) that is approximately 100 times larger than the calculated increase from annual development of 40 new nuclearly stimulated wells. EXPOSURES TO FIVE TARGET HEALTH HAZARDS,
Occupational Safety and Health Administration, Washington, D.C.
F. H. Ryer.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 389-394.

Descriptors: *Public health, *Hazards, *Toxins, *Toxicity, *Measurement, Pollutants, Bioassay, Pathology, Lead, Inhibitors, Control, Asbestos

Cotton, Dusts, Carbon, Gases, Silica, On-site data collections, Air pollution, Water pollution.
Identifiers: Cotton dusts, Carbon monoxide.

A target health hazards program (THHP) initiated in January 1972 by the Occupational Safety and Health Administration, is described. The five substances singled out as target health hazards (asbestos, cotton dust, carbon monoxide, lead, and silica) are discussed in detail. The exposure potential is given for each substance as well as the method for measuring the concentration in air. Optimum measures for controlling or preventing each hazard are given. The number of inspections made in workplaces from the time of program inception to date is presented. In addition, the number of employees affected in THHP inspections, the number of measurements made of exposures, the number of samples taken, and the severity of exposures for each hazard are given. AN EXAMINATION OF DESIGN PARAMETERS IN A FIELD STUDY FOR EXPOSURE EVALUATION,
Eastern Environmental Radiation Facility, Montgomery, Ala.
J. A. Broadway, J. E. Partridge, S. T. Windham, and C. R. Phillips.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 405-410, 1 fig, 2 tab, 4 ref.

Descriptors: *Monitoring, *Measurement, *Radioactivity, *Effluents, *Nuclear powerplants, Evaluation, On-site tests, Investigations, Design criteria, Predictions, Forecasting, Xenon, Public health.
Identifiers: *Population exposure.

Continuous exposure measurements over several months in the vicinity of an operating boiling water nuclear power reactor (BWR) plant and corresponding predictions for exposure during the same time period have been examined by several statistical tests. The purpose of these tests has been to quantitate parameters important in the experimental design of such investigations. Conclusions regarding the length of such studies and the number of field measurement sites required are presented. Field measurement of ground-level 133Xe gaseous concentration has been compared with predicted concentrations. Implications regarding the conversion from atmospheric concentration to exposure rates are discussed. Overall implications regarding the design of other such field studies are presented. The Eastern Environmental Radiation Facility (EERF) has conducted a field study in the vicinity of an operating boiling water reactor. Results from a validation study for an atmospheric dispersion code (AIREM) developed by the Office of Radiation Programs have been reported previously. The present investigation was performed to analyze these results for implications important in the experimental design of similar such studies. Standard statistical tests have been employed to aid decision making to maximize the productivity while minimizing redundancy and cost involved in field studies. (See also W75-04152) (Houser-ORNL)

POPULATION EXPOSURE TO NATURAL TERRESTRIAL GAMMA RADIATION AROUND SELECTED NUCLEAR POWER PLANT SITES,
EG and G, Inc., Las Vegas, Nev.
Z. G. Burson.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 411-420, 3 fig, 3 tab, 10 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Air pollution, *Water pollution, *Measurement, Public health, Surveys, Remote sensing, On-site tests, Sites, Environment, Soil contamination, Fallout, Population, Distribution, Solar radiation, Background radiation.
Identifiers: *Population exposure, *Dose rates.

The average dose rates from external penetrating natural terrestrial gamma radiation have been determined from airborne survey data for specific areas surrounding each of 20 nuclear power plants. This dose rate information has been combined with population distribution data to obtain the average tissue dose-equivalent rate per person. This evaluation covers 19,400 square miles, inhabited by 4.4 million people. Average dose-equivalent rates ranged from a low of 18 mrem/yr at Oyster Creek to 113 mrem/yr at Fort St Vrain. For 18 sites in the Northeastern and North-central United States the mean terrestrial dose-equivalent rate per capita was 46 mrem/yr, while the average without regard to population distribution was 43 mrem/yr. In comparison, cosmic ray levels for the 18 sites range from 29 to 32 mrem/yr for elevations from 0 to 1200 ft above sea level. (See also W75-04152) (Houser-ORNL)

ASSESSMENT OF PUBLIC RADIATION EXPOSURE IN THE VICINITY OF U.S. AEC SITES,
Division of Operational Safety (AEC), Washington, D.C.
C. G. Welty, Jr., and M. W. Tiernan.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 421-428, 1 fig, 8 tab, 6 ref.

Descriptors: *Monitoring, Environment, *Surveys, *Measurement, *Sites, *Radioactivity, Regulation, Standards, Public Health, Operations, On-site tests, Investigations, Path of pollutants, Effluents, Meteorology, Dispersion, Air pollution, Water pollution, Soil contamination, Human population.
Identifiers: Dose, *Population exposure.

There are 27 major AEC sites in the United States which handle or process radioactive materials in quantities to warrant the maintenance of a routine environmental monitoring and reporting program. In 1972 as part of this routine program, these sites made an annual assessment of the radiation dose to the public which could have resulted from operations conducted at the site. Actual measurements of radioactivity in the pathways of exposure close to man are used whenever possible, although for certain nuclides, like noble gases, estimates of dose are normally made using effluent and meteorological data, and appropriate dispersion equations. Estimates include (1) site boundary dose rates, (2) population dose, and (3) the whole-body 80 kilometer man-rem population dose. In 1973 estimated whole-body dose rates near the boundary of AEC sites ranged from less than 1 to about 30 mrem per year, or from less than 1 to about 6 percent of the radiation protection standard for an individual. The doses are dependent on the types of operations conducted at the particular site and often on the size of the site itself. The 80 kilometer man-rem estimates for all AEC sites ranged from less than 1 to about 195 man-rem per year, the maximum due primarily to tritium. (See also W75-04152) (Houser-ORNL)

Identifiers: Low light level television.

Details were provided of the prototype Airborne Oil Surveillance System (AOSS) design. The AOSS is a multisensor airborborne surveillance system configured to assist the Coast Guard in enforcement of antipollution legislation and assessment/clean-up of accidental spills. The surveillance system consists of (1) an X-band sidelooking

radar system for long-range ship detection and adverse weather oil spill mapping; (2) a 37 GHz passive microwave imaging system for adverse weather spill mapping and spill thickness approximation; (3) multispectral low light level TV system for spill identification, high resolution documentation, and violator identification; (4) a multichannel infrared line scanner for spill identification and discrimination; (5) a position reference system for legal and operational effectiveness; and (6) a real-time processor/display console for maximum operational effectiveness. 5B. Sources Of Pollution

PREDICTION OF RADIOISOTOPE CONCENTRATIONS IN FRESHWATER STREAMS,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
J. G. Seelye, and N. R. Kevern.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 892, $5.25 in paper copy, $2.25 in microfiche. Technical Report No 42, Institute of Water Research, Michigan State University, East Lansing, December 1974; PhD thesis. 120 p, 26 fig, 28 tab, 34 ref, 2 append. OWRT A-075-MICH(1). 14-31-0001-4022.

Descriptors: *Radioisotopes, Aquatic life, Ponds, Hazards, Zooplankton, Sediments, Fish, Stable isotopes, *Forecasting, Alkalinity, Dissolved oxygen, Hardness(Water), *Cesium, *Zinc radioisotopes, *Path of pollutants.
Identifiers: Isotope additions, 512 channel spectrometers, Sodium iodide, Thallium activated detectors, Alkalinity, Total solids, pH measurements, Diurnal oxygen measurements, Oxygen-temperature monitoring, Cs134, Zn65, Isotope transfer, *Specific activity concept.

Predictions of radioisotope concentrations in components of aquatic systems have been attempted using the specific activity concept, an approach that seems theoretically sound. A comprehensive examination of the specific activities of 134 Cs and 65Zn in the components of a freshwater system, over a 10 month period, was conducted to evaluate the specific activity hypothesis under applied conditions. This study was designed to provide comparisons of predicted and observed specific activities and to test the equivalence of specific activities between all components of the system. Four ponds were used. A prediction of specific activities was made using Pond 1 data. The distribution of stable Cs and Zn throughout the system was determined and predictions of specific activities, based on these distributions were made. The other three ponds served as controls or provided observed specific activities. Radioisotopes of Cs and Zn were added to the system and after a period of equilibration comparisons were made between predicted and observed specific activities in the water, zooplankton, fish, plants, and sediment. In all cases observed specific activities for both 134Cs and 65Zn were significantly different between components of the systems at the end of the study period. Predicted 134Cs and 65Zn concentrations were lower than observed concentrations for fish from Pond 1. This nonconservativeness is important where hazard assessments are being made. Problems with statistical comparisons of derived variables are discussed and considered in interpreting the results.

ACETYLENE REDUCTION (NITROGEN FIXATION) BY PULP AND PAPER MILL EFFLUENTS AND BY KLEBSIELLA ISOLATED FROM EFFLUENTS AND ENVIRONMENTAL SITUATIONS,
McGill Univ., Ste. Anne de Belleire (Quebec).
R. Knowles, R. Neufeld, and S. Simpson.
Applied Microbiology, Vol 28, No 4, p 608-613, October, 1974. 3 fig, 3 tab, 20 ref.

Descriptors: *Pulp wastes, *Nitrogen fixation, *Nitrogen fixing bacteria, Aerobic conditions, Anaerobic conditions, Azotobacter, Industrial wastes, Natural streams, Rivers, Lakes, Drainage systems, Sewage effluents, Microbial degradation, Water pollution sources, Wastes, Aquatic microorganisms, Aquatic bacteria.
Identifiers: Woodroom(Pulp mill), Acetylene, Bacillus, Klebsiella.

High rates of acetylene reduction (nitrogenase activity) were observed in woodroom effluent from a neutral sulfite semichemical pulp mill under aerobic and anaerobic conditions. Under aerobic conditions up to 644 nanomoles of acetylene/ml/hr were produced, while under anaerobic conditions the rate was up to 135 nanomoles of acetylene/ml/hr. Pasteurized effluent developed acetylene reduction activity when incubated under anaerobic but not under aerobic conditions. Activities were increased by the addition of 0.5-3.0% glucose or xylose. Enrichment and enumeration studies showed that nitrogen-fixing Azotobacter and Klebsiella were abundant, and nitrogen-fixing Bacillus was present. Of 129 isolates of Klebsiella from pulp mills, lakes, rivers, and drainage and sewage systems, 32% possessed nitrogen-fixing ability. (Witt-IPC)

WATER POLLUTION AND CONTROL,
Rivers House, Glasgow, (Scotland).
G. A. Best.
Journal of the Society of Dyers and Colourists, Vol 90, No 11, p 389-393, November, 1974. 4 tab, 16 ref.

Descriptors: *Textiles, *Water pollution control, *Legislation, *Water quality standards, Waste water disposal, Governments, Water pollution sources, Waste water treatment, Water pollution, Financing, Industries, Effluents, Bleaching wastes, Biological treatment, Water treatment, Water sources, Rivers, Europe, Pollution abatement, Waste treatment.
Identifiers: *Scotland.

The demand for clean water for industry and for domestic supply is increasing yearly. Many readily accessible supplies are fully exploited, and water authorities must now consider hitherto polluted rivers as possible future water sources. To meet the demand for clean water and for cleaner rivers which receive waste discharges, considerable expenditures will be required from both central and local governments and from industry for new water treatment plants. Legislation covering river pollution and waste water disposal in Scotland is described, and the particular problem of effluents from the textile industry is discussed. Previous studies have demonstrated that waste water from the textile industry can be treated by conventional biological and other techniques and be purified sufficiently to meet national and local water quality standards. KINETICS OF MICROBIOLOGICALLY MEDIATED TRANSFORMATIONS OF HEAVY METALS IN AQUATIC ENVIRONMENTS,
Cornell Univ., Ithaca, N.Y. Dept. of Environmental Engineering.
A. W. Lawrence.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 148, $3.25 in paper copy, $2.25 in microfiche. Completion Report, (1974). 12 p, 54 ref. OWRT A-038-NY(2), 14-31-0001-3532, 3832, 4032.

Descriptors: *Heavy metals, *Aquatic environment, *Water quality, *Management, *Mercury, *Zinc, *Wastes, Research, Environmental effects, Kinetics, Anaerobic conditions, Aerobic conditions, Waste water treatment, Toxicity, Reverse osmosis, Bibliographies, Environmental engineering.
Identifiers: Heavy metal removal, Metal finishing wastes, Biological sludges.

Research project accomplishments, and application of the results, are presented from a study to investigate the fate of heavy metals in the aquatic environment for purposes of developing quantitative models for engineering management of water quality. Mercury, the subject of recent intense interest, was studied first. Primary emphasis was placed on determining the kinetics of microbially mediated transformation of mercury under both aerobic and anaerobic conditions. In the latter phase of the project, a literature review was conducted on the process methodology of removal of metals other than mercury from aqueous wastes prior to environmental release. Results of this review are useful in estimating the potential problems associated with metals other than mercury. Also, an experimental study on the fate of zinc-enriched biological sludges in an aquatic environment was performed. Zinc was selected for this final study because it does not appear to be microbially transformed as is mercury and thus may represent a second pathway for metal distribution of immobilization in aquatic systems. NITROGEN FIXATION BY BLUE-GREEN ALGAE-LICHEN CRUSTS IN THE GREAT BASIN DESERT,
Utah State Univ., Logan. Dept. of Soil Biochemistry and Microbiology.
R. C. Rychert, and J. Skujins.
Soil Science Society of American Proceedings, Vol. 38, No. 5, September-October, 1974. p 768-771, 3 tab, 5 fig, 17 ref.

Descriptors: *Deserts, *Nitrogen fixation, *Nitrogen, *Moisture availability, Shrubs, Temperature, Light, Ecosystems, Moisture, Arid climates, *Cyanophyta.
Identifiers: Blue-green algae-lichen crusts, Water potential.

The nitrogen fixation process of blue-green algaelichen in a desert ecosystem was examined. The acetylene reduction technique was used to measure nitrogen fixation under field conditions which were then compared to laboratory nitrogen fixation potentials. The blue-green algae crusts were forced to have a laboratory potential for nitrogen fixation ranging from 75 to 84 percent of N fixed ha -1/hour -1. Peak values in the field were only 13 to 18 percent of these values. Prediction is possible based on temperature during fall and rainy seasons when light and moisture are generally not limited. During the hot, dry months, moisture limits nitrogen fixation. Nitrogen fixation was reduced under desert shrub canopies possibly as a result of alleopathic effects by the shrubs. Despite the many factors limiting nitrogen fixation, blue-green algae-lichen crusts are an important aspect of nitrogen input into the desert shrub ecosystem. (Mastic-Arizona)

SHALLOW GROUND WATER IN SELECTED AREAS IN THE FORT UNION COAL REGION.
Geological Survey, Helena, Mont.
Open-file report, 1974. 130 p, 18 fig, 12 tab, 68 ref.

Descriptors: *Strip mines, *Montana, *North Dakota, *Wyoming, *Water pollution sources, Water levels, Hydrogeology, Water resources, Aquifers, Environmental effects.
Identifiers: Environmental impact.

Groundwater conditions and the possible effects of strip mining on shallow aquifers are considered for three priority areas in the northern Great Plains--the Gascoyne area in North Dakota, the Gillette area in Wyoming, and several subareas within the Birney-Decker area in Montana. The effects of mining will include: (1) localized disruption of the coal and overlying sandstone aquifers and loss of existing wells in the mined area; (2) drainage of clinker beds adjacent to the mined area; (3) drainage of the coal and overlying sandstone aquifers in an area around the mine; this effect will be most apparent along the strike of the beds in the immediate vicinity of the mine; (4) underlying aquifers in recharge areas should be little affected, but removal of coal and overburden might cause a small increase in upward leakage from underlying aquifers in discharge areas; (5) blasting and handling of the coal could increase nitrate and sulfate concentrations in mine waters. The most detrimental effect on the groundwater system may be contamination of the water resource by dissolved materials leached from the excavated overburden or spoils, which are used for mine backfill. Available data indicate that the leachate may contain several times more dissolved solids than water in the aquifers and also may contain harmful concentrations of trace elements, including heavy metals. PRECONSTRUCTION ASSESSMENT OF BIOLOGICAL QUALITY OF THE CHENA AND LITTLE CHENA RIVERS IN THE VICINITY OF CHENA LAKES FLOOD CONTROL PROJECT NEAR FAIRBANKS, ALASKA,
Geological Survey, Anchorage, Alaska.
G. A. McCoy.
Water-Resources Investigations 29-74, November 1974. 84 p, 9 fig, 21 tab, 48 ref, 3 append.

Descriptors: *Water quality, *Rivers, *Reservoirs, *Alaska, Flood control, Dissolved oxygen, Arctic, Cold regions, Pre-impoundment, *Data collections.
Identifiers: *Chena River(Alaska).

Chemical and biological data were collected on the Chena and Little Chena Rivers, Alaska, from October 1972 through August 1973 to determine the water quality of these rivers prior to construction of the Moose Creek and Little Chena Dams. Chemical-quality measurements included conductivity, alkalinity, pH, dissolved oxygen, nitrogen and phosphorous species, dissolved iron, and biochemical and chemical oxygen demand. Biological measurements included a semiquantitative and qualitative assessment of benthic invertebrates, periphyton, and phytoplankton. The river is a typical clean-water subarctic stream with excellent water-quality characteristics. The chemical and biological water-quality constituents in the studied reach of the Chena and Little Chena Rivers are relatively uniform with the possible exception of iron and chemical oxygen demand which increase downstream. Productivity is low. The flora and fauna are diverse and characteristic of cold water streams high in dissolved oxygen and low in productivity. The construction and operation of the Moose Creek Dam probably will not appreciably alter the present water-quality conditions of the system except for possible temporary effects due to construction. (Knapp-USGS)

SOLID WASTE AND WATER QUALITY, (LITERATURE REVIEW),
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. A. Heidman, and D. R. Brunner.
Journal Water Pollution Control Federation, Vol 46, No 6, p 1315-1317, June, 1974. 20 ref.

Descriptors: *Water quality control, *Leaching, *Solid wastes, Hydrogeology, *Groundwater, Landfills, Attenuation, Waste disposal, Pesticides, Alkalinity, Nitrogen, Mercury, Cadmium, Chromium, Chemical oxygen demand, *Path of pollutants, *Bibliographies, *Reviews.
Identifiers: Leachate attenuation, Antimony, Cyanogens.

The potential for groundwater pollution resulting from the land disposal of solid wastes has been reviewed. Leachate characteristics, leachate attenuation in soil, leachate pollution problems, site evacuation methodology, and new refuse processing and disposal methods which have a potential effect on groundwater quality were examined. Solid waste disposal as related to leachate production and groundwater pollution and consideration to design of landfills for leachate control were discussed. Toxicity and solubility of hazardous solid and liquid wastes were considered. Reduction, neutralization, recovery and disposal techniques recommended for waste streams containing pesticides, CN, Hg, As, Cr, Cd and miscellaneous organic and inorganic materials and nuclear materials were examined also. The hydrogeologic factors in consideration of the situating and design of landfills under climatic conditions in northeastern Illinois were discussed. Engineering techniques effective in control of production and migration of leachate are also examined with conceptual designs for landfills in four different hydrogeologic environments. An evaluation of sanitary landfills and factors influencing leachate production was made. Soil types, groundwater flow patterns, and leachate characteristics at a landfill site in use for 5 years were examined in detail. (Leibowitz-FIRL)

NITRATE AND CHLORIDE ACCUMULATION AND DISTRIBUTION IN FERTILIZED TILE-DRAINED SOILS,
Minnesota Univ., St. Paul. Dept. of Soil Science.
R. G. Gast, W. W. Nelson, and J. M. MacGregor.
Journal of Environmental Quality, Vol 3, No 3, p 209-213, July-September, 1974. 5 fig, 3 tab, 9 ref.

Descriptors: *Nitrates, *Chlorides, *Soils, *Tile drains, Loam, Fertilization, Soil treatment, Denitrification, Leaching, Corn(Field), *Minnesota, Distribution.
Identifiers: Webster loam, Waldorf silty clay, Nitrate loss.

Corn studies on tile drained Webster loam in Minnesota determined that annual N application up to 70 percent greater than N removed in grain is necessary for maximum yields. The purpose of the study was to establish the relative role of N incorporation into the soil organic matter and/or loss through denitrification, downward leaching, or tile drainage in the determination of the fate of this fertilizer-N added above that removed in corn grain. Accumulation of nitrate and chloride and their distribution were determined in Webster loam and Waldorf silty clay loam profiles after long term fertilization for continuous corn crops. Concentrations in the profiles were determined at 0.3 m depth intervals and increasing distances from the tile lines. (Leibowitz-FIRL)

SOLID WASTE DISPOSAL BY LAND BURIAL IN SOUTHERN INDIANA,
Indiana Univ., Bloomington.
D. B. Waldrip, and R. V. Ruhe.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 225, $5.25 in paper copy, $2.25 in microfiche. Purdue Univ. Water Resources Research Center, West Lafayette, Indiana, Technical Report No. 45, November 1974. 110 p, 24 fig, 32 tab, 62 ref. OWRT B-049-IND(1).

Descriptors: *Landfills, *Solid wastes, *Water quality, Surface waters, *Groundwater, Disposal, *Waste disposal, Surface runoff, Overland flow, Percolating water, Subsurface water, Perched water, Water table, *Indiana, Water pollution sources, *Path of pollutants.

Studies were made of selected landfills in Southern Indiana to determine their effect on ground and surface waters. The purpose was to define field models of the geohydrologic systems, determine ground and surface water movement, analyze changes in water quality, establish landfill criteria for protection of the water, and develop landfill site guidelines. On the three sites examined, landfill leachate was introduced into the ground and/or surface water. The level of contamination was dependent on an interrelation of the original topography, the initial soil sediment stratigraphy, the ground and surface hydrologic system, modification of the topography and stratigraphy, and nature and volume of waste. Recommendations for landfill site selection are made and include: use of upland and non-flooding areas, the highest elevation of the water table should be several feet below the base of solid wastes, underlying soil should have high exchange capacity, leachate lagoons should be used where surface runoff is a problem, rilling of soil cover, and ground water wells and surface water monitoring stations should be installed. A progress report is also presented on the organic compounds and carbon in ground water from landfill effluent. (Wiersma-Purdue)

SPRING AND FALL THERMAL BAR DEVELOPMENT IN LAKE SUPERIOR,
Michigan Technological Univ., Houghton. Dept. of Chemistry and Chemical Engineering.
D. W. Hubbard, and J. D. Spain.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 227, $3.25 in paper copy, $2.25 in microfiche. Completion Report, Institute of Water Research, Michigan State University, E. Lansing, December 1974. 20 p, 13 fig, 4 ref, append. OWRT A-071-MICH(1). 14-31-0001-4022.

Descriptors: Pollutants, Fluorescence, *Lake Superior, *Seasonal, *Temperature, Computer programs, *Thermometers, Measurement, Water pollution sources, Lakes.
Identifiers: Digital thermistor thermometer, *Thermal bars.

The thermal bar is a downwelling phenomenon which occurs parallel to the shore during the spring warming and the fall cooling of large temperate zone lakes. The thermal bar is of practical interest because it traps pollutants in the nearshore zone during certain seasons of the year. The fine structure of the Lake Superior thermal bar was studied during the spring and fall of 1974 with approximately 16 transects being made across the bar using a digital thermistor thermometer capable of 0.01 C accuracy in the vicinity of 4C. This equipment was designed at Michigan Technological University and represents the most accurate portable equipment available at this time. Data were plotted by computer using the SYMAP program. Natural fluorescence arising from land runoff was employed to distinguish between inshore and offshore water masses. This study has provided enough data to demonstrate that the thermal bar rivals the well-known thermocline as an agent in limiting the movement of water masses. The results suggest that the thermal bar is affected by a variety of factors such as shoreline configuration, depth, wind, bottom slope, and previous temperature history.
W75-04038

IRREVERSIBLE THERMODYNAMIC CONCEPT ON HYDROGEOCHEMICAL TRANSPORT SYSTEMS,
Nevada Univ., Reno. Desert Research Inst.
J. V. A. Sharp, and C. L. Carnahan.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 254, $3.25 in paper copy, $2.25 in microfiche. Completion Report, January, 1975. 7 p, 9 ref. OWRT A-046-NEV(2).

Descriptors: Thermodynamics, *Thermodynamic behavior, Geochemistry, *Groundwater movement, *Path of pollutants, *Energy transfer, Heat transfer.
Identifiers: *Irreversible thermodynamics.

Accurate, useful interpretation of ground-water flow systems as mobilization and transportation agents for various chemical constituents is required for better understanding of the movement of chemical parameters (and contaminants) in the subsurface. In order to develop the most accurate means of modeling a ground-water flow system, irreversible thermodynamic theory is applied. Assembling and solving mathematical expressions relating chemical and thermal potentials to velocity of ground-water flow and incorporating time- and concentration-dependent expressions for rates of various types of reactions which alter chemical and thermal potentials and concentrations of dissolved constituents are explored. Using ground water as a closed system in which energy is interchanged with its surroundings through heat transfer and also as an open system which included mass interchanges were developed. Results show that the utilization of irreversible thermodynamics provides a consistent and unifying approach to the study of simultaneous, coupled, non-equilibrium processes affecting chemical mobilization and transport in ground-water systems. (Fallon-Nevada)
W75-04041

DEGRADATION IN GROUNDWATER AND MOBILITY OF HERBICIDES,
Nebraska Univ., Lincoln. Dept. of Agronomy.
C. W. Weidner.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 242, $4.75 in paper copy, $2.25 in microfiche. M.S. Thesis, June 1974. 69 p, 9 fig, 10 tab, 55 ref. OWRT A-024-NEB(2). 14-31-0001-4027.

Descriptors: Water quality, *Groundwater, *Herbicides, *Degradation(Decomposition), *Path of pollutants, Pesticide residues.
Identifiers: Atrazine, Alachlor, Butylate, Picloram.

Laboratory studies were conducted to determine the degradation rates for atrazine, alachlor, butylate and picloram stored in groundwater. A significant amount of herbicide degradation occurred over the duration of the experiment. The rate of degradation was dependent on chemical properties of the herbicide, concentration, storage temperature and to a lesser extent the source of the water samples. Butylate showed the largest amount of degradation followed by alachlor, atrazine and picloram respectively. The 0.072 and 0.72 ppmw concentration samples result in more degradation than the 10 ppmw concentration samples. The samples stored at 25C resulted in more degradation than the samples stores at 10C. Water samples from the Clay Center location showed more herbicide degradation than the other three water sources. While herbicide degradation in groundwater did occur, the rate was much slower than would be expected for the same herbicides in a soil medium.
W75-04045

LONG TERM TRENDS IN WATER QUALITY, LOWER HAW AND NEW HOPE RIVERS - 1966-1973,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
C. M. Weiss.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 232, $7.75 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Rept. No. 101, October 1974. 196 p, 1 fig, 14 tab, 16 ref, 3 append. OWRT A-056-NC(4). 14-01-0001-3533.

Descriptors: Water quality, *Biochemical oxygen demand, *Phosphorous, *Nitrogen, *Dissolved oxygen, *Monitoring, Forecasting, *Long-term planning, *North Carolina, Water pollution sources, Rivers.
Identifiers: Haw River(NC). New Hope River(NC).

A seven-year river sampling series of the lower Haw and New Hope Rivers, North Carolina, designed to establish their water quality profiles, has shown a level of quality generally associated with substantial pollution loads. However, in the main stem of the Haw at a point at the head of the arm of the proposed B. Everett Jordan Lake (New Hope Lake), oxygen and BOD5 quantities indicate that stabilization of oxygen-demanding materials and nitrification of nitrogenous substances have occurred. The total phosphorus concentration in the Haw River is several times that of control streams of the area and the total load of trans-

ported phosphorus (lbs/day) is approximately five times that of the New Hope River. Sharp changes in several water quality parameters were evident in a comparison of the period prior to 1970 and after 1970. These changes have been identified with an overall change in river runoff in the region, resulting from a shift in the pattern of dry to wet years. The change in water quality caused by variation in average runoff was substantial enough to mask any changes that may have occurred from variations in quantity of polluting substances introduced from upstream sources. This emphasizes the difficulty of establishing long-term trends based upon infrequent and short-term sampling series. (McJunkin-N.C. State)
W75-04046

THE DILUTION CAPACITY OF SMALL STREAMS IN SOUTH CAROLINA,
South Carolina Univ., Columbia. Dept. of Geology.
W. E. Sharp.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 231, $4.75 in paper copy, $2.25 in microfiche. South Carolina Water Resources Research Institute, Clemson, Report Number 48, September 1974. 70 p, 1 fig, 3 tab, 4 ref. OWRT A-026-SC(7).

Descriptors: *Waste dilution, Mixing, *Path of pollutants, *South Carolina, *Maps, *Streams, Statistical methods, Rivers, *Classification, Topography.
Identifiers: *Santee River(SoCar).

Topographic and stream maps may be used to make preliminary estimates of the dilution capacity of rivers and small streams. Statistical work indicates that for rivers of South Carolina both area and link magnitude (M) of rivers (map scale = 1:500,000) are excellent predictors of discharge along the length of a river basin. The expected river discharges are: maximum 242 cfs/M, mean 34.5 cfs/M and minimum 6.4 cfs/M. Good estimates of small stream discharge were much more difficult to make and are not as reliable as river discharge. The greatest uncertainty here arises from the definition of a first magnitude stream (map scale = 1:24,000) as interpreted by the map makers. The newer maps tend to show more streams than do the older maps. This effect is particularly emphasized in areas where large numbers of farm ponds have been constructed. Reasonable preliminary discharge values are: maximum 152 to 176 l/sec/M (5.65 cfs/M); mean 8.5 to 21.7 l/sec/M (0.3 to 0.77 cfs/M); minimum 0.5 l/sec/M (0.018 to 0.12 cfs/M). In small stream basins, the down stream estimate of discharge can be obtained by using a gamma distribution law.

Descriptors: Sediments, *Phosphorus, *Lake sediments, Nutrients, Rooted aquatic plants, Wisconsin, *Absorption, *Nutrient removal.
Identifiers: *Myriophyllum spicatum, *Macrophytes.

The quantity of available P in selected sediments was evaluated by measurement of the amounts of P removed from sediments by Myriophyllum spicatum L. grown in columns containing sediment as the sole P source and amended with other essential nutrients. The relationships between the amount of sediment inorganic P added, the yield and P content of the plants, and the uptake of sediment inorganic P were evaluated. Available P comprised from 12.3 to 17.2% of total sediment inorganic P for the eight lake sediments investigated. Relationships between P uptake by Myriophyllum plants (microg P/g of sediment) and the total Pi, nonoccluded Pi, and Total Exch Pi contents of sediments were evaluated. Correlation coefficients were 0.99, 0.98, 0.97, respectively for the dependent variables, namely, total Pi, nonoccluded Pi, and Total Exch Pi, indicating that each of these measurements provided a good index of available P in lake sediments. However, the uptake of sediment P by Myriophyllum plants arose mainly from the nonoccluded Pi fraction (NaOH-P in calcareous sediments and NH4F-plus NaOH-P in noncalcareous sediments), and most of the exchangeable inorganic P was contained in the nonoccluded Pi fraction, indicating that available P was obtained mainly from the exchangeable inorganic P fraction.

NUCLEAR METEOROLOGY,
Hydrometeorological Service of the USSR, Moscow.
Available from the National Technical Information Service, Springfield, Va. 22161, as TT-74-50011, $10.60 paper copy, $2.25 microfiche. Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk 1974. 387 p, 133 fig, 100 tab, 525 ref.

Descriptors: *Meteorology, *Nuclear energy, *Radioactivity, *Nuclear explosions, *Fallout, Air pollution, Water pollution, Soil contamination, Radioactive tracers, Aerosols, Rain, Raindrops, Geophysics, Instrumentation, Measurement, Radiochemical analysis.
Identifiers: *USSR.

The All-Union Conference on Nuclear Meteorology was held on 23-28 June 1969 at the Institute of Experimental Meteorology in the town of Obinsk. The following are the main topics discussed at the Conference: (a) Utilization of radioactive tracers in meteorological investigations; (b) global contamination of the atmosphere and fallout of radioactive products of nuclear blasts; (c) natural radioactivity of the atmosphere; (d) atmospheric scavenging of radioactive contaminants; (e) formation of radioactive contamination of the environment. Other questions relating to the accumulation of radioactive products of nuclear blasts on the earth's surface were also examined. (See W75-04055 and W75-04108) (Houser-ORNL)
W75-04054

VERTICAL DISTRIBUTION OF RADIOACTIVE AEROSOLS IN THE TROPOSPHERE OVER THE EUROPEAN USSR IN 1964-1967,
L. E. Nazarov, L. A. Volokitina, Y. I. Gaziev, A. F. Kuzenkov, and S. G. Malakhov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 1-16, 3 fig, 10 tab, 10 ref.

Descriptors: *Meteorology, Nuclear energy, *Nuclear explosions, *Radon, *Aerosols, Air pollution, Distribution, Radiation, Atmosphere.
Identifiers: *Troposphere, *Stratosphere, *USSR.

Data are given on the vertical distribution of the concentration of decay products of radon and aerosol products of nuclear blasts in the troposphere over the USSR in 1964-1967. Aerosynoptic analysis of cases of considerable growth and decrease in the concentration of fission products in the ground air layer in the vicinity of Moscow established that the drift of stratospheric aerosols into the upper troposphere takes place at the tropopause discontinuity or funnel at the cyclonic periphery of the jet. At ground level the radioactive spot appears most frequently beneath the anticyclonic periphery of the jet. Examination of the simplest theoretical models of the vertical concentration distribution of fission products and short-lived decay products of radon in the troposphere yields the coefficient of vertical turbulent diffusion k(sub z) and speed of vertical ordered motion Omega, whose values are given. W75-04055

DISTRIBUTION OF FISSION PRODUCTS OVER OCEANS IN THE TROPICAL ZONE AND THEIR RELATION TO ATMOSPHERIC PROCESSES,
G. V. Dmitrieva, Y. V. Krasnopevtsev, and S. G. Malakhov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 17-28, 7 fig, 9 ref.

Descriptors: *Meteorology, *Nuclear energy, *Radioactivity, *Atmosphere, Transport, *Oceans, Pacific Ocean, Indian Ocean, Tropical cyclones, Measurement, Latitudinal studies, Tropical regions, Distribution.
Identifiers: *Fission products.

New data (for the period 1967-1968) are examined regarding the latitudinal distribution of the concentration of fission products over oceans in different regions of the tropical zone. The data show that the air at sea level in the tropical zone over the Indian Ocean and the West Pacific in the considered period is very inhomogeneous as regards the content of radioactive products. This inhomogeneity was caused by the influx in the tropical zone of air with higher radioactivity from subtropical or moderate latitudes (winter hemisphere) after the passage in these latitudes of quasimeridional cold fronts. These incursions possibly contribute sometimes also to the formation of separate zones of convergence lines in the equatorial region. Under certain synoptic conditions, the air entering the equatorial region from extratropical latitudes at times crossed the equator and could be included in the circulation of the other hemisphere. The assumption is made that, after their transformation into deep wide cyclones, Pacific typhoons can contribute to the transport of air from the southern to the northern hemisphere. ACCUMULATION OF STRONTIUM-90 IN SOILS,
E. B. Tyuryukanova.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 61-66, 4 fig, 4 tab, 12 ref.

Descriptors: Meteorology, Nuclear energy, *Radioisotopes, *Nuclear explosions, *Fallout, *Air pollution, *Soil contamination, *Strontium, Distribution, Assay, Soil properties, Soil types, Sands, Loam, Humus, Physicochemical properties, Geochemistry.
Identifiers: Weapons testing, USSR.

A very uneven distribution of Sr-90 is observed in the soils of the Russian Plain. The content of this radioactive nuclide in sandy soils is lower than in loamy soils, and depends on the amount of soil humus and its qualitative composition. The accumulation of Sr-90 in soils is determined both by its physiochemical composition, and by the landscape and geochemical conditions. Of great importance is the character of the runoff. In most soils Sr-90 is concentrated in the upper layer (0-5 to 0-20 cm). (See also W75-04054) (Houser-ORNL)

Descriptors: Meteorology, Nuclear energy, *Nuclear explosions, Fallout, *Cesium, *Strontium, *Lead, *Radioisotopes, *Soil contamination, Geographical regions, Migration, Physicochemical properties, Permafrost, Arctic, Snow cover, Plutonium, Assay, Radioecology, Absorption.
Identifiers: Far North, USSR.

The part played by soil in the pollution of subsequent links of the chain of natural and artificial radionuclides in regions of the Far North is considered. While a geographic variation exists of the levels of artificial contamination of the soils, the ratio of cesium-137 to strontium-90 in all regions remains between 1.3 and 1.6. Experimental data are given on the mechanism governing the contamination of lichen (the main fodder of reindeer) by natural and artificial nuclides. An analysis is given of museum samples (1900-1945), indicating the absence of any connection between the high levels of lead-210 in the North and nuclear tests. The levels of plutonium-239 content in the vegetation of some regions of the Far North are determined. (See also W75-04054) (Houser-ORNL)
W75-04063

COMPARATIVE DISTRIBUTION OF STRONTIUM-90 AND CESIUM-137 IN DIFFERENT TYPES OF SOILS,
E. I. Belova, and Z. G. Antropova.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 72-75, 3 tab, 4 ref.

Descriptors: *Meteorology, *Nuclear energy, *Radioisotopes, *Fallout, *Strontium, *Cesium, Distribution, Migration, Assay, *Soil types, Soil profiles, Geochemistry, Physicochemical properties.

Results are presented of investigations into the distribution of strontium-90 and cesium-137 along the profile of five types of virgin soil 10 years after their contamination. The investigations were conducted under natural conditions on artificially contaminated plots of sod podzolic, gray forest, leached chernozem, meadow solod and solonchak soils. By the tenth year some characteristic features are observed in the distribution of the investigated radioisotopes along the profile of different types of soils. The influence of the forest cover on the migration rate and distribution of radioisotopes along the soil profile is noted. The soils are arranged in the following series according to the content of cesium-137 in the upper layer (0-4 cm): meadow solod < gray forest < solonchak < leached chernozem. The series for strontium-90 content is as follows: meadow solod < sod podzolic < solonchak < gray forest < leached chernozem. (See also W75-04054) (Houser-ORNL)
W75-04064

DISTRIBUTION AND MIGRATION OF STRONTIUM-90 IN SOILS,
L. I. Gedeonov, S. P. Rosyanov, and V. K. Vinogradova.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 76-84, 5 fig, 4 tab, 5 ref.

Descriptors: *Radioactivity, *Fallout, *Strontium, Assay, *Soil profiles, Migration, Distribution, Soil types, Physicochemical properties, Analytical techniques, Diffusion, Radiochemical analysis, Sands, Loam.

Results are given of a study of Sr-90 distribution along soil profiles. These data can be used in an attempt to study the mechanism of Sr-90 migration in soil. Soil samples taken at depths down to 30 cm were subjected to radiochemical analysis for Sr-90. Sr-90 in 1964-1965 was mainly retained in a 15-cm soil layer. Measurable amounts of Sr-90 were found in the 25-30-cm layer. The distribution of Sr-90 along the profile of loamy soils can be described in a first approximation by a power law. Calculations with its aid show that Sr-90 penetrates deeper than 40-60 cm. The motion of radioactive fission products inside the soil cover involves a combination of different physicochemical processes in the soil, the most important of which are Sr-90 migration by diffusion and isotope migration together with the soil solution. The vertical distribution of Sr-90 in soils resulting from diffusion alone was calculated with the aid of the coefficients found. Comparison of the calculated distribution of Sr-90 with the distribution obtained by radiochemical determination of Sr-90 showed that in loamy chernozem Sr-90 migrates mainly by diffusion. In sandy sod podzolic soil this process is of the same order as the others. (See also W75-04054) (Houser-ORNL)

HORIZONTAL WATER MIGRATION OF STRONTIUM-90,
I. G. Vodovozova.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 85-87, 1 fig, 1 tab, 5 ref.

Descriptors: Meteorology, *Radioisotopes, *Strontium, Fallout, *Snow, *Melt water, *Assay, Movement, Cations, Migration, Soil contamination, Water pollution, Leaching, *Path of pollutants.

During spring snowmelting, radioactive strontium deposited on the earth's surface participates with melted snow in migration processes. Data are presented on the physicochemical state of strontium-90 migrating with water; 73% of strontium-90 falling with snow is in cationic form. Atmospheric precipitation is deposited in the soil, participates in the migration processes, and subsequently leaches mainly soluble strontium-90 from the soil and its proportion in cationic form in the melted snow and river water increases to 100%. Existing in an easily mobile cationic form, strontium-90 is discharged in the river together with floodwaters. (See also W75-04054) (Houser-ORNL)

FORMATION OF RADIOACTIVE PARTICLES DURING NUCLEAR BURSTS IN THE TROPOSPHERE,
Y. A. Izrael', and A. A. Ter-Saakov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 88-94, 8 ref.

Descriptors: Meteorology, *Nuclear energy, *Nuclear explosions, *Aerosols, *Radioisotopes, Zirconium, Lanthanum, Yttrium, Thermal radiation, Thermodynamic behavior, Equilibrium, Thermodynamics, Temperature, Sorption, Solids, Clouds, Particle size, Condensation, *Model studies.

A theoretical model of aerosol radioactivation in the fireball of a nuclear burst is examined. Formulas are derived for the distribution of the radioactivity of isotopes on the aerosol particles as a function of particle radius. Three mechanisms of particle radioactivation are treated. In the first case, condensation of radioactive isotope vapors occurs at temperatures higher than the vaporization temperature of the soil particles (approx. 2300 C), i.e., under conditions far removed from thermodynamic equilibrium. Such is the case for isotopes of zirconium, lanthanum, yttrium, and other refractory elements. In the second case the condensation of radioisotopes occurs on the surface of fused soil particles, i.e., under conditions of thermodynamic equilibrium (in the temperature range 2300-1400 C). In the third case aerosol activation is determined by radioisotope sorption on the surface of solid particles. Such is the case for isotopes which have gaseous precursors with half-decay periods from tens of seconds to several minutes (Sr-89, Sr-90, Cs-137, Ba-140). The influence of the precipitation of large particles from a cloud at the moment of radioactivation is taken into account. (See also W75-04054) (Houser-ORNL)
W75-04067

CALCULATION OF FRACTIONATION EFFECTS IN ATMOSPHERIC NUCLEAR BURSTS,
Y. A. Izrael'.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 95-100, 3 fig, 6 ref.

Descriptors: Meteorology, *Nuclear energy, *Nuclear explosions, Theoretical analysis, *Distillation, *Radioactivity effects, *Thermodynamics, Liquids, Gases, Tellerium, Strontium, Cesium, Mathematics
Identifiers: Isotopic fractionation, Raoult's Law, Isotopic fractionation.

A theoretical calculation is given of the coefficients of fractionation of radioactive isotopes in aerosols, formed during nuclear bursts. The calculations are conducted on the assumption of thermodynamic equilibrium between the liquid and gaseous fractions with the utilization of Raoult's law. The results are given of the calculation of the fraction of radioactive isotopes of the most important mass chains condensing on the aerosols as a function of the time after the burst. Also calculated are the coefficients of fractionation fi. 95 for the isotopes Te-132, Sr-90, Sr-89, and Cs-137 in the form of functions of particle radius (the time of particle solidification is 7 sec). The calculations are performed for the nearest trace of the surface blast. The derived theoretical correlation curve of fractionation of the series of isotopes agrees satisfactorily with measurements of isotope fractionation at the nearest trace of the 'Small Boy' low-strength American nuclear explosion. (See also W75-04054) (Houser-ORNL)
W75-04068

THE ATMOSPHERIC FORMATION OF SECONDARY AEROSOLS DURING VENTILATED UNDERGROUND NUCLEAR TESTS,
V. N. Petrov, and A. A. Ter-Saakov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 101-103, 3 ref.

Descriptors: *Model studies, Meteorology, *Nuclear energy, *Nuclear explosions, Underground, *Radioactivity, Radioisotopes, Soil contamination, Air pollution, Krypton, Xenon, *Aerosols.

In underground nuclear tests, some radioactive products may be discharged into the atmosphere through excess pressure or ventilation due to the destruction of rocks in the test area and the formation of cracks near to ground level. The direct outflow into the atmosphere of nongaseous radioactive products is hardly probable, due to their sorption in the subsoil rock layer. It is therefore natural to assume that, in the main, chemically inert gases (such as the isotopes of krypton and xenon) are discharged into the atmosphere. The appearance of nonvolatile radioisotopes in the atmosphere can be associated with the decay of radioactive gases, which are the precursors of such isotopes in the corresponding chains of radioactive transformations. Nongaseous radioisotopes formed in the atmosphere are deposited on atmospheric dust particles and form so-called 'secondary' aerosols. A model of the atmospheric formation of the decay products of gaseous radioisotopes during underground nuclear tests is examined. (See also W75-04054) (Houser-ORNL)
W75-04069

SIZE DISTRIBUTION OF HIGH-ACTIVITY PARTICLES IN THE TROPOSPHERE IN SEPTEMBER-DECEMBER 1967,
Y. I. Gaziev, S. G. Malakhov, and L. E. Nazarov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 104-110, 4 fig, 1 tab, 18 ref.

Descriptors: *Meteorology, *Nuclear energy, *Nuclear explosions, Testing, *Aerosols, Radioactivity, Particle size, Distribution, Distillation, Cerium, Ruthenium, Zirconium, Stratosphere, Troposphere, Fallout.
Identifiers: *Isotopic fractionation.

High-activity particles of artificial radioactive aerosols were observed in the troposphere in September-December 1967. The 'age' of the aerosols at the beginning of the observation period was approx. 2.5 months. Radioactive particles of diameter d > or = 0.9 microns were investigated. According to the results obtained in the ground layer of the atmosphere and the upper troposphere, the integral and differential size distribution of these particles was exponential for d > or = 0.9 microns. On the average for the troposphere the exponent was equal to 1.4 plus or minus 0.2 d/micron. For radioactive particles of diameter between 2 and 6 microns, the fractionation coefficients of the isotopes Ce144, Ce141, and Ru103 were determined with respect to Zr95. The values of these coefficients were roughly the same as those given earlier in the literature for micron particles of atmospheric nuclear blasts. The time of residence in the stratosphere particles of diameter between 2.5 and 6 microns was roughly 4.5 months. The scavenging rate of radioactive particles of micron size (d = 1-6 microns) in the lower troposphere was close to 2km/day. (See also W75-04054) (Houser-ORNL)
W75-04070

STATE OF STRONTIUM-90, CESIUM-137, AND CERIUM-144 IN RADIOACTIVE FALLOUT,
F. I. Pavlotskaya, R. Surotkevichiene, and G. P. Levina.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 111-117, 1 fig, 3 tab, 14 ref.

Descriptors: Meteorology, Nuclear energy, *Radioactivity, *Radioisotopes, *Fallout, Chemical properties, Chemical reactions, Solvents, *Strontium, *Cesium, *Cerium, Cation absorption, Anion adsorption, Ion exchange.

Investigations into the state and chemical form of existence of Sr90, Cs137, and Ce144 in global fallout during 1958-1968 are described. Substantial differences are shown between the soluble and insoluble fractions in the distributions of the different radionuclides. Independently of the geographical location of the observation stations, the decreasing soluble fraction in the indicated period is preserved in the sequence Sr90 > Cs137 > Ce144, the values being on the average 78, 62, and 16%, respectively. The radionuclides in the insoluble fraction possess different mobilities. When treating the insoluble remainder by 1 N CH3COONH4 and 1N HC1, more than 90% of the Sr90 and up to 65-70% of the Cs137 and Ce144 pass into the solution. The latter indicates that most of the radionuclides in the insoluble fraction are in exchange and mobile states, and not in the form of slightly soluble compounds (such as Ce02). In a soluble state, the radionuclides are present in cationic, anionic, and neutral forms. The ratios between the latter are different in the various radionuclides. The distribution between these three forms is 90, 6, and 4% for Sr90, 72, 16, and 12% for Cs137, 55, 18, and 27% for Ce144. Acertain trend is observed toward an increase in the relative fraction of Sr90 and Cs137 in anionic form and a decrease in the fraction in neutral form during the winter compared with the summer period. (See also W75-04054) (Houser-ORNL)
W75-04071

SOME THEORETICAL NOTIONS OF RADIOACTIVITY ACQUISITION BY RAINDROPS,
A. S. Avramenko, and K. P. Makhon'ko.
In: Nuclear Meteorology, Preceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 118-132, 8 fig, 21 ref.

Descriptors: *Meteorology, *Nuclear energy, *Absorption, *Raindrops, *Radioactivity, Precipitation(Atmospheric), Clouds, Air circulation, Size, Distribution, Nuclear explosions, Aerosols, Transmissivity, Fallout, Dusts, Scavengers.

An approximate model is given of the acquisition of radioactivity by raindrops during their formation and precipitation from a cloud. The process taking place in a cloud with ordered ascending currents, leading to the size distribution of the specific radioactivity of raindrops observed on the earth, is examined. Comparison of theoretical calculations of the concentrations of the products of nuclear bursts in raindrops of different sizes with experimental data enabled us to determine the value of the coefficient of radioactive aerosol-particle washout by cloud-borne droplets and to establish the existence of an inverse relationship between the concentration of nuclear burst products in cloud-borne droplets and their radius. This relationship is near-inverse for raindrops. The obtained size distribution of the specific radioactivity of raindrops can lead to an increase in the specific radioactivity of rainwater at the end of brief showers due to the decrease in raindrop size. APPLICATION OF THE STOCHASTIC APPROACH TO THE PROBLEM OF THE RADIOACTIVITY OF RAINDROPS AND CLOUD-BORNE DROPS,
A. S. Avramenko.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 137-145, 1 fig, 13 ref.

Descriptors: *Meteorology, *Nuclear energy, *Radioactivity, *Raindrops, *Statistical models, *Stochastic processes, Mathematics, Distribution, Clouds, Rain, Size.

An attempt is made to apply the stochastic approach to the problem of the radioactivity of raindrops and cloud-borne drops. A general system of equations is written with which to calculate the distribution function of the cloud-borne drops with respect to activity for the radioactive series of natural decay products in elemental state. A steady solution is given for the case when the concentrations of the preceding elements of the radioactive series can be neglected. The obtained distribution is used to derive a relationship between the number of nonradioactive raindrops and their size. The theoretical relationships and published experimental data are in satisfactory agreement. (See also W75-04054) (Houser-ORNL)
W75-04074

COMPARISON OF THE CHARACTERISTICS OF HYGROSCOPIC AND NON-HYGROSCOPIC AERSOL WASHOUT BY CLOUD-BORNE DROPS,
I. I. Burtsev, and L. V. Burtseva.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 146-153, 4 fig, 2 tab, 11 ref.

Descriptors: *Meteorology, Nuclear energy, *Radioactivity, *Fallout, *Raindrops, *Aersols, *Hygroscopic water, Moisture, Adsorption, Distribution, Particle size, Raindrops, Physical properties, Comparative productivity, Radioisotopes.

Washout by cloud-borne drops of aerosol of size 0.1-0.5 microns is examined as a function of its hygroscopicity. Radioactive hygroscopic P2(to the 32nd power)05 and non-hygroscopic Sr89CO3 aerosols were investigated and their washout characteristics compared. On the basis of an experimental comparison of the characteristics of the capture of aerosol of the same disperse group, but with different physical properties, that the hygroscopicity of the aerosol substantially affects its behavior in a cloud medium. The capture efficiency of hygroscopic aerosol is twice that of nonhygroscopic aerosol. (See also W75-04054) (Houser-ORNL)
W75-04075

ATMOSPHERIC WASHOUT OF RADIOACTIVE CONTAMINANT IN THE MOUNTAINS OF CENTRAL CAUCASUS,
A. S. Avramenko, and K. P. Makhon'ko.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 154-165, 4 fig, 3 tab, 22 ref.

Descriptors: *Meteorology, *Nuclear energy, *Radioactivity, *Fallout, *Rain, Measurement, Altitude, Clouds, Atmosphere, Dusts, Assay, Precipitation(Atmospheric), Snow, Air circulation, Velocity, Sampling, Radon.
Identifiers: Specific radioactivity.

The coefficient Sigma of radioactive dust washout from the subcloud layer of the atmosphere was determined by measuring the contaminant concentration in precipitation at two different altitudes in 1968-1969 in mountains. The mean value of Sigma for the products of nuclear bursts in steady rain was 3 times 10(-5) sec(-1); for showers Sigma is roughly twice as large, and for snows five times as large. Measurements during steady rain for upslope and downslope winds enabled us to estimate the mean speed of the ascending air currents, found to be approx 0.6 m/sec. With increase in precipitation intensity I the value of Sigma decreases rapidly at first, passes through a

minimum when I approx. 1 mm/hr, and then increases. Vertical air currents affect the obtained relationship. When measuring Sigma for short-lived decay products of radon, samples were taken simultaneously at two altitudes, a radiotelephone being used to ensure simultaneity. Due to the brief sampling time of rapidly decaying samples, the influence of fluctuations in the concentration of natural radioactivity in precipitation (C) and in air (q) and fluctuations in precipitation intensity was so large that it was not possible to determine Sigma for rains; for snow Sigma approx 9 times 10(-5) sec (-1) with a 95% error. Similarly, from the results of 313 observations no time-dependence was detected of the specific radioactivity of precipitation (C) against the background of the large fluctuations in the measured quantity. UTILIZATION OF NATURAL RADIOACTIVE SUBSTANCES IN THE STUDY OF TURBULENT EXCHANGE AND ATMOSPHERIC SCAVENGING BY MEANS OF GROUND MEASUREMENT,
V. N. Bakulin, E. E. Sen'ko, B. G. Starikov, and V. A. Trufakin.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 166-172, 2 fig, 14 ref.

Descriptors: *Meteorology, *Radioactivity, Winds, *Thoron, *Lead, Measurement, Atmosphere, Fallout, Anticyclones, Precipitation(Atmospheric), Rain, Aerosols, Transmissivity, Uniformity coefficient, Research and development, *Turbulence.
Identifiers: *Troposphere, *Stratosphere, *Inversion.

On the basis of round-the-clock measurements of the exhalation of thoron and the concentrations of thoron and Pb212 (ThB) at heights of 1 and 5 m, mean values were obtained of the growth rate of the turbulence coefficient with height in a summer anticyclone, equal to 5-10 cm/sec by day and about 3 cm/sec at night. These data enable one to evaluate the mean value of the turbulence coefficient in the lower km layer of the troposphere with the aid of ground measurements. Unlike thoron and Pb212(ThB), radon cannot be considered as existing in quasi-steady conditions, and nonsteady models of its behavior in the atmosphere must be used . Near the earth, the ratio between the decay products of radon is a good indicator of the time variation in the turbulent exchange . Maximum perturbations of equilibrium in the radon series are observed in the morning and evening, during the establishment and destruction of the night inversions. It is noteworthy that in the morning hours one can observe many specific features in the height distribution of radioactive substances, explained by the mechanisms of the inversion destruction process. Data are given about the washout coefficients of radioactive aerosols by precipitation on the basis of Pb212(ThB), radon and Pb210(RaD) concentration measurements. (See also W75-04054) (Houser-ORNL)

RELATION BETWEEN ATMOSPHERIC PRECIPITATION WASHOUT OF RADIO-ACTIVITY AND NONACTIVE IONS,
L. I. Piskunov, and S. I. Tarasov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 182-186, 32 ref.

Descriptors: *Meteorology, *Radioactivity, *Radioisotopes, *Stable isotopes, *Air pollution, *Correlation analysis, Equations, *Fallout, Rain, Evaluation, Radiation, Assessment, Research and development, Background radiation, Chlorides, Sulfates, Troposphere, Mathematics.

A correlation in the form of a power relationship is assumed between the atmospheric washout of radioactive and nonactive contaminants. The latter chlorides and sulfates were selected, they differ from the others in that their background ratio in atmospheric precipitation for the continental part of European USSR is stable. For a tropospheric background radioactivity, the constancy of the relation in atmospheric precipitation of the radioactivity q withrespect to the chlorides m and the sulfates n follows from their identical washout laws. On the basis of logarithmic equilibrium constants P1 and P2, it is possible to derive an approximate evaluation of the radioactive state of the atmosphere. To determine constants P1 and P2 one requires observations with sufficient statistics subject to the conditions of the background concentration of the contaminants. It is assumed that the absence of a correlation between dust washed out from the atmosphere, radioactive components, and the background concentration of nonactive ions can serve as an indicator of anomalous phenomena. COSMOGONIC SODIUM-22 AND BERYLLIUM-7 ISOTOPES IN INVESTIGATIONS OF ATMOSPHERIC DYNAMICS,
V. Y. Luyanas, R. Y. Yasyulenis, and B. I. Styro.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 194-196, 1 tab, 2 ref.

Descriptors: *Meteorology, Atmosphere, *Air pollution, Radioactivity, *Radioisotopes, *Sodium, *Beryllium, Evaluation, Ratios, Mathematics, Measurement, Aircraft, Sampling, Research and development, Background radiation.
Identifiers: Troposphere, Stratosphere, *Cosmogonic radioisotopes, Cosmic rays.

The possibility of using the ratio of concentrations of the cosmogonic radioisotopes Na22 and Be7 for dnetermining the penetration of stratospheric air to the earth's surface is examined. The measurements were carried out at Elektrenai and Vilnius between 1965 and 1969. In some cases, the Na22/Be7 ratio reached values that were typical of stratospheric air. It is preferable to use a pair of isotopes of which one has a lifetime of several years, to study the air exchange between the stratosphere and troposphere. (See also W75-04054) (Houser-ORNL)

ARGON SPALLATION YIELDS OF COSMOGONIC RADIOISOTOPES,
R. Y. Yasyulenis, V. Y. Luyanas, and B. I. Styro.
In: Nuclear Meteorology, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 197-200, 2 tab, 8 ref.

Descriptors: Meteorology, *Argon, *Radiation, *Nuclear physics, *Radioisotopes, Rates, Frequency, Mathematics, Equations, Yield equations, Elements(Chemical).
Identifiers: *Cosmic rays, *Cosmogonic radioisotopes, *Spallation.

The evaluation of the rates at which cosmogonic isotopes are formed by argon spallation is described. The cross sections of isotope formation are calculated from a refined Rudstam formula. The yields are given for one star of F18, Ne24, Na22, Na24, Mg28, Al28, Al29, Si31, Si32, P30, P32, P33, S37, C134, C136, and C138 isotopes. The yield dependence on one star from the depth of the atmosphere is also given. (See also W75-04054) (Houser-ORNL)

ASSESSMENT OF RADON EMANATION FROM THE SURFACE OF EXTENSIVE TERRITORIES,
T. I. Sisigini.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 239-244, 2 fig, 3 tab, 10 ref.

Descriptors: *Meteorology, *Radium, *Radon, Movement, *Soils, *Measurement, Assay, Density.
Identifiers: *Emanation, Flux, USSR.

A method is discussed of assessing radon emanation from a surface covered by one type of soil, under uniform and stable conditions. The results of comprehensive observations are examined, including measurements of the flux density of radon from the soil surface into the atmosphere, of radon concentration in the soil profile to a depth of 2 m, emanation factors and radium content in the soil, and the determination of soil porosity and water content. Based on experimental data obtained at about 40 different locations in European USSR, a correlation is established between radium content in the surface soil layer and radon emanation into the ground layer of the atmosphere. FALLOUT AND ACCUMULATION OF RADIOACTIVE DECAY PRODUCTS IN 1966-1968 IN THE VICINITY OF LENINGRAD,
N. V. Vasil'eva, L. I. Gedeonov, Z. G. Gritchenko, M. I. Zhilkina, and V. M. Flegontov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 340-346, 3 fig, 2 tab, 8 ref.

Descriptors: Meteorology, Nuclear energy, *Fallout, *Nuclear explosions, *Measurement, *Radioisotopes, Cerium, Ruthenium, Zirconium, Cesium, Strontium, Density, Atmosphere, Air circulation, Movement.
Identifiers: *USSR(Leningrad).

Results are presented of observations of the isotope composition of global radioactive fallout in 1966-1968 in the Leningrad region, the fallout density of radioactive fission products, and the amount of radioactive products deposited on the ground surface at the observation point. Ce141, Ru103, and Zr95 were recorded in 1966-1968 in the ground layer of the atmosphere and in atmospheric precipitation. Longer-lived radionuclides such as Ce144 and Ru106, mostly penetrating from the stratospheric source of radioactive contamination, in 1968 contributed much to the overall proportion of total beta activity. The recording of these radionuclides in radioactive fallout samples in 1967 was at the sensitivity limit of the measuring instruments. The fallout density of Sr90 was 1.6 mcurie/km sq in 1966, 0.8 mcurie/km sq in 1967, and 1.0 mcurie/km sq in 1968; that of Cs137 was 1.3, 1.7, and 1.9 mcurie/km sq, respectively. Altogether 50.3 mcurie/km sq Sr90 and 96.9 mcurie/km sq Cs137 fell to the ground in 1954-1968 in the vicinity of Leningrad (the figures refer to the moment of fallout). Based on an analysis of the activity ratio of short-lived radionuclides (Ce141, Zr95) to long-lived ones (Sr90, Ru106, Ce137, Ce144), the global radioactive fallout in the Leningrad district in 1966-1968 is due almost entirely to 1966-1967 nuclear explosions, while Sr90 and Cs137 from earlier nuclear tests were present in insignificant amounts only. At the end of 1968, the accumulated activity of the total beta-radioactive fission products is given for major radioisotopes. Owing to the low rate of Sr90 and Cs137 fallout, the accumulated activity of these radionuclides remained at the 1965 level of 42.3 and 82 mcurie/km sq, respectively. PENETRATION OF RADIOACTIVE FISSION PRODUCTS FROM 1964-1967 NUCLEAR TESTS INTO THE GROUND LAYER OF THE ATMOSPHERE IN THE LENINGRAD AREA,
L. I. Gedeonov, Z. G. Gritchenko, and V. M. Flegontov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 347-352, 6 fig, 7 ref.

Descriptors: *Meteorology, *Nuclear energy, *Nuclear explosions, Testing, *Fallout, Density, Measurement, *Radioisotopes, Atmosphere, Barium, Lanthanum, Cerium, Ruthenium, Zirconium, Niobium, Cesium, Aerosols, Sampling, Stratosphere, Withdrawal.
Identifiers: Gamma spectrometers, *USSR(Leningrad), Troposphere.

Radioactive fission products formed during tests of nuclear weapons in countries that did not adhere to the Moscow agreement on the prohibition of nuclear tests in the three media were recorded in 1964-1968 in the ground layer of the atmosphere in the Leningrad area. The following radioactive isotopes were determined with the aid of a scintillation and a Ge(Li) drift gamma spectrometer in radioactive aerosols filtered out of the ground layer of atmospheric air: Ba140, La140, Ce141, Ru103, Zr95, Nb95, Ce144, Ru106, and Cs137. The forming of these radioactive fission products was dated from the activity ratios of the following pairs of radionuclides: Ba140/Ce141, Ce141/Zr95, Ce141/Ce144, Zr95/Ce144, and Ce144/Cs137. These radionuclides turned out to have been released into the atmosphere during the explosions of 14 October 1964, 14 May 1965, 9 May, 27 October and 28 December 1966, 17 June and 24 December 1967. Atmospheric nuclear tests of increasing power and the depletion of the stratospheric reserve of radioactive fission products from the 1961-1962 test series produced a stable balance in the stratosphere between the long-lived radionuclides from nuclear tests conducted in 1964-1967. The proportion of long-lived fission products from these nuclear explosions therefore began to predominate in 1966 in global radioactive fallout. (See also W75-04054) (Houser-ORNL)

VERTICAL DISTRIBUTION OF THE CONCENTRATION OF RADON DECAY PRODUCTS IN THE 0-300-M LAYER,
L. V. Kirichenko, and S. G. Malakhov.
In: Nuclear Meteorology, Proceedings, All-Union Conference on Nuclear Meteorology, June 23-28, 1969, Obninsk. p 358-360, 2 tab, 1 ref.

Descriptors: *Meteorology, *Vertical migration, *Distribution, Height, *Measurement, *Radon, Data collections, Data transmission, Sites, Density, Analytical techniques, Filters, Air, Time, Temperature.
Identifiers: Temperature inversions, Troposphere.

Data on the vertical distribution of the concentration of radon decay products in the 0-300-m layer of the atmosphere are provided. The measurements were carried out in August 1961 on the Obninsk altitude tower of the Institute of Experimental Meteorology. During daytime, the concentration of radon decay products remains practically constant throughout the layer. In the evening and at night it drops rapidly with increasing altitude from the ground surface up to a height of 50-75m. (See also W75-04054) (Houser-ORNL)

Journal of the Fisheries Research Board of Canada, Vol 31, No 5, p 545-553, May, 1974. 10 fig, 13 ref.

Descriptors: *Benthos, *Animal groupings, Autumn, Leaves, Streams, *Nutrients, *Organic matter, Ecology, *Decomposing organic matter, *Biodegration, Bacteria, Fungi, Food habits, Seasonal.
Identifiers: Gammarus, Chironomidae, Blackfly larvicide.

A coring technique showed that stream animals are vertically distributed many centimeters down

into the gravel, with 17 percent in the top 5 cm. Arctic stream sampling chironomid larvae comprised 70-80 percent of numbers in the benthos; their rate of drift did not vary with the time of day. The effect of nutrients and temperature on the decomposition of autumn leaves shed in water was studied. The addition of nutrients N and P increased the amount of nitrogen after incubation, but temperature affected only the decomposition rate. The importance of bacteria and fungi in decomposition were noted. Food preference for several leaf species were shown by Gammarus. Up to 40 percent of autumn-shed leaf is water-soluble. One process by which it is made available to stream animals is conversion to particles and involves mechanisms similar to those found in soils. Field investigations showed large-scale fluctuations, in a short time period, of dissolved and particulate matter in the water. (Carpenter-FIRL)

Descriptors: *Pollutants, *Sediments, *Environmental effects, Water quality, *Water pollution sources, Humic acids, Hydrogen ion concentration, Water pollution effects.
Identifiers: Microbial activity.

Significant fractions of past incoming pollutants have accumulated in the sediment phase, which can gradually and continuously release the pollutants into the overlying water, thereby degrading the water quality. This study was undertaken to investigate important factors governing the release of pollutants from selected sediments and subsequent effects on water quality. Research data obtained have indicated that the mechanisms of pollutant release are mostly physical-chemical in nature. Biological action plays only a minor role. Magnitudes of pollutant release have been found to be more pH dependent than temperature dependent. An increase in pH will result in a corresponding increase in organic release which may be explained in part by the increased dissociation of humic acids at a higher pH. Under a closed system used in this study, the pollutant release can reach an equilibrium state in a matter of two to three days.

POPULATION EXPOSURE TO NATURAL RADIATION BACKGROUND IN PUERTO RICO,
Puerto Rico Nuclear Center, Rio Piedras.
A. E. Gileadi, and D. L. Pitre.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 53-60, 5 fig, 1 tab, 9 ref.

Descriptors: *Monitoring, *Geographical regions, *Puerto Rico, *Background radiation, *Human population, *Distribution, Geography, Radioactivity, Fallout, Computer programs.
Identifiers: Natural radiation, Cosmic radiation, Demography, Terrestrial radiation.

External exposure to natural radiation background of the population in Puerto Rico has been estimated using published data concerning terrestrial and cosmic radiation, and demographic data on population distribution with respect to elevation and geographic location. Cosmic radiation data published by a number of investigators, along with methods to account for the variation of cosmic radiation intensity as a function of geomagnetic latitude and elevation, were used to determine the cosmic radiation dose equivalent as a function of geographic location in Puerto Rico. Data measured in the framework of the ARMS-Aerial Radiation Measurement Survey program at an elevation of 500 feet above ground level, along with an appropriate conversion factor, were used to evaluate the terrestrial component as a function of geographic location. Estimates of the annual dose equivalent rate due to exposure to external natural radiation background for each municipality of Puerto Rico and the insular average value were derived by means of a computer program written for that purpose. Inputs for this program included measured and calculated values of terrestrial and cosmic ray components of the natural radiation background in Puerto Rice, fallout corrections and relevant demographic data. A REVIEW OF EFFLUENTS, GENERAL POPULATION DOSES, AND OCCUPATIONAL DOSES RESULTING FROM COMMONWEALTH EDISON'S USE OF NUCLEAR POWER,
Commonwealth Edison Co., Chicago, Ill.
J. C. Golden, and R. A. Pavlic.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 173-180, 3 fig, 3 tab, 10 ref.

Descriptors: *Nuclear powerplants, *Effluents, *Measurement, *Monitoring, *Human population, *Distribution, *Public health, Operations, Power operation and maintenance, Iodine, Tritium, Liquid wastes.
Identifiers: Population exposure, Occupational exposure, Non-occupational exposure, Doses, Noble fission gases.

Commonwealth Edison has 5270 MWe (net) of nuclear power licensed today and an additional 9316 MWe (net) scheduled for operation by the end of 1983. Operation of these power reactors exposes people to low level environmental and occupationally incurred radiation. The integral dose 'man-rem' is a useful term for measuring the total radiation dose received by a group of people because the term reflects the dose and population distributions within or around a station. At Dresden with three operating boiling water nuclear power reactors (BWR) units, the first of which began operation in 1960, the 1973 non-occupation population dose (to 50 miles radius) was 275 man-rem (with a shielding and occupancy factor of two included). At Quad Cities with two two-year old BWR units, the dose was 30 man-rem, and at Zion, two pressurized water reactor (PWR) units in start-up testing, the dose was essentially zero. The 1973 occupational doses were 908 man-rem at Dresden, 201 man-rem at Quad Cities, and 15.4 man-rem at Zion. The annual population doses from natural radiations are 610,000 man-rem at Dresden, 60,000 man-rem at Quad Cities, and 720,000 man-rem at Zion. Hence, the total contribution to the population dose from operation of Commonwealth Edison's nuclear facilities--the sum of the occupational plus nonoccupational doses--is much less than one percent of that received from natural sources. A review is presented of the effluents, and general population and occupational doses resulting from Commonwealth Edison's use of nuclear power from 1960 to mid-1974. TRENDS IN POPULATION RADIATION EXPOSURE FROM OPERATING BWR GASEOUS EFFLUENTS,
Office of Radiation Programs, Washington, D.C.
J. A. Martin, Jr., C. B. Nelson, and H. T. Peterson, Jr.
In: CONF. 741018, Preceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 181-190, 2 fig, 3 tab, 15 ref.

Descriptors: *Nuclear powerplants, Effluents, *Measurement, *Radioactivity, *Diffusion, *Standards, Public health, Assay, Assessment, Safety, Evaluation, Xenon, Absorption, Control, *Air pollution.
Identifiers: Dose, *Population exposure, Boiling water reactors, Noble gases, Charcoal beds.

External radiation exposures resulting from atmospheric emissions of radionuclides from operating boiling water nuclear power reactors (BWRs) were computed using the EPA AIREM diffusion-dose code. In 1971, 10 operating BWRs generated a total of 1850 megwatt-years of electrical energy. Three million curies of noble gases were discharged resulting in a population-integrated radiation dose of 900 person-rems delivered to 16 million people. In 1972 14 BWRs produced 3400 MW(e)-yrs and resulted in a total population dose of 1650 person-rem to the 22.4 million people residing within 80 km (50 miles) of these facilities. Projections for the 400 GW(e) installed BWR capacity forecast for the year 2000 indicate that over 450 potential health effects could be committed annually if only a 30-minute holdup were employed. Use of charcoal adsorption beds with a 10-day xenon holdup could reduce this annual impact to 14 potential health effects. (See also W75-04152) (Houser-ORNL)
W75-04165

POPULATION EXPOSURE ESTIMATES AS DERIVED FROM AN ENVIRONMENTAL ASSESSMENT OF LWR FUEL CYCLE FACILITIES. PART I: POPULATION DOSES FROM OPERATING FACILITIES,
Oak Ridge National Lab., Tenn.
J. P. Witherspoon.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 191-198, 4 tab, 13 ref.

Descriptors: *Nuclear powerplants, *Fuels, *Environment, *Radioactivity, *Assessment, *Public health, Effluents, Model studies, Population, Uranium, Plutonium, Path of pollutants, Food chains, Operations, Ecology, Ecosystems.
Identifiers: Fuel reprocessing plants, Fuel cycle, Source terms.

Model facilities which are typical in terms of current design, location, and surrounding populations were used as the basis for this study. The radiological impacts of a uranium mill (2000 tons of ore per day), fuel fabrication plants (5 tons of uranium dioxide fuel per day and 1 ton of uranium-plutonium oxide per day), and a fuel reprocessing plant (5 tons of fuel per day were determined. Estimates of radiation dose to total body and organs of populations out to a distance of 50 miles were made for each facility. Sources of radioactive effluents were process dusts and airborne-tailings (mills), vented particulates (fabrication plants), and stack releases of gases and particulates (reprocessing plant). Pathways for external exposure (immersion in air and contaminated ground surface) and internal exposure (inhalation and ingestion) were considered. Estimates of radiation dose to populations (man-rems) and identification of exposure pathways and major radionuclides are given for each facility. (See also W75-04152) (Houser-ORNL)
W75-04166

POPULATION EXPOSURE ESTIMATES AS DERIVED FROM AN ENVIRONMENTAL ASSESSMENT OF LWR FUEL CYCLE FACILITIES, PART II: LONG-TERM POPULATION DOSES FOLLOWING CESSATION OF PLANT OPERATIONS,
Oak Ridge National Lab., Tenn.
J. P. Witherspoon, and D. C. Parzyck.
In: CONF. 741018, Preceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 199-206, 4 tab, 7 ref.

Descriptors: *Nuclear powerplants, *Fuels, *Effluents, *Radioactivity, *Environment, *Assessment, Safety, Evaluation, Population, Public health, Model studies, Uranium, Plutonium, Path of pollutants.
Identifiers: *Population exposure, Fuel cycle, Source terms, Doses.

The increased use of nuclear power reactors for generation of electricity will require a growth in the number of nuclear fuel cycle facilities to support the power reactors. Facilities in the nuclear fuel cycle release radionuclides to the environment which may contribute to population radiation dose long after the nuclear facility has ceased operation. The long-term environmental impact of model support facilities was studied. The contribution of the long-lived radionuclides released by the nuclear fuel cycle plants to long-term population exposures was calculated from the time of cessation of plant operations until significant decay of the radionuclides. The model plants were typical of current design and location, and the surrounding populations were representative of present-day populations. The model facilities included a uranium mill (2000 metric tons of ore per day), fuel fabrication plants (5 metric tons of uranium dioxide fuel per day, 1 metric ton of uranium-plutonium oxide fuel per day), and fuel reprocessing plant (5 metric tons of fuel per day). The longest-lived radionuclides released by each type of plant were enumerated and the area of radionuclide deposition defined. The significant pathways of exposure were examined with an evaluation of the population exposure resultant from resuspension of deposited activity, ingestion of deposited radionuclides, and radiation from contaminated ground surface. Dose estimates were made for populations (man-rems) living in the vicinity of the nuclear plants, and the average dose was calculated for the critical organ for each long-lived radionuclide. PROJECTIONS OF RADIOACTIVE WASTES FROM THE NUCLEAR FUEL CYCLE,
Oak Ridge National Lab., Tenn.
J. O. Blomeke, and C. W. Kee.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 215-222, 10 tab, 5 ref.

Descriptors: *Nuclear energy, *Nuclear reactors, *Nuclear powerplants, *Radioactivity, *Effluents, Properties, Waste identification, Waste treatment, Waste storage, Waste disposal, Fuels, Transportation, Assay, Assessment, Toxicity, Public health, Air pollution, Water pollution, Forecasting, Projections.
Identifiers: *Waste management, Fuel cycle.

Estimates of the properties and quantities of radioactive waste materials that will be generated in commercial nuclear fuel cycle operations are useful in establishing a basis for planning and development of safe and environmentally acceptable methods of management of these wastes. A comprehensive set of projects of radioactive wastes to be generated is projected for the remainder of this century based on the most recent forecast of nuclear power growth in the United States. Ten types of radioactive wastes are identified on the basis of their packaging, shipping, and probable disposal requirements, and the annual rates of generation, annual numbers of shipments, and accumulations of each type of waste are estimated. In addition, a measure of the relative toxicity of each waste on an annual and accumulated basis is tabulated. The measure of toxicity is defined as the cubic meters of air or water that would be required to dilute all the radioactive constituents of the waste to the concentrations specified in the AEC's Radiation Concentration Guide as being the maximum allowable for unrestricted use. CONDOS-A MODEL AND COMPUTER CODE TO ESTIMATE POPULATION AND INDIVIDUAL RADIATION DOSES TO MAN FROM THE DISTRIBUTION, USE AND DISPOSAL OF CONSUMER PRODUCTS THAT CONTAIN RADIOACTIVE MATERIALS,
Oak Ridge National Lab., Tenn.
F. R. O'Donnell, F. H. Clark, O. W. Burke, L. R. McKay, and A. N. Tse.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 327-332, 2 tab, 3 ref.

Descriptors: *Monitoring, *Model studies, *Computer programs, *Radioactivity, *Instrumentation, *Distribution patterns, *Ion transport, *Waste disposal, Human population, Public health, Estimation, Assessment, Measurement.
Identifiers: Doses, Computer codes.

A model and computer code (CONDOS) is being developed that estimates radiation doses to man from distribution, use, and disposal of a variety of consumer products that contain radioactive materials. CONDOS utilizes a generalized format in which the life span of a consumer product is divided into five main stages (distribution, transport, use, disposal, and emergencies) that require descriptions of the activities by which man will be exposed to the product (events) during each stage. These descriptions delineate homogeneous groups of exposed persons, and thus facilitate the selection of individuals who represent the exposed groups. The radiation doses associated with one year of product use to the total body and selected reference organs and tissues of representative individuals can be estimated for each mode of exposure that is applicable to each event. Summation of the doses to representative individuals yields group and total population doses. An example of the use of CONDOS is presented. (See also W75-04152) (Houser-ORNL)

WATER FOR THE HUMAN ENVIRONMENT, VOLUME IV, SPECIAL SESSIONS.
Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois. 557 p.

Descriptors: *Water resources, *Conferences, *Planning, *Environment, *Thermal pollution, *Systems analysis, *Water pollution, Hydraulics, Heated water, Water temperature, Water cooling, Water pollution sources, Lakes, Aquatic environment, Ecology, Agriculture, Water quality, Waste water treatment, Hydrographs, Unit hydrographs, Watersheds(Basins), Heating.
Identifiers: *Human environment.

Water for the human environment was discussed at a congress held at Chicago in 1973. The four broad topics discussed in Volume IV were: (1) thermal pollution, (2) systems analysis, (3) post-construction assessment, and (4) water pollution. Subjects discussed included identifying and assessing local thermal inputs on physical and biological environments, experimental and analytical characterization of thermal discharge, utilization of waste heat in agriculture, wastewater treatment, recreation, and a system concept incorporating power generation with other industrial process activities. W75-04213

EVALUATION OF WATER TEMPERATURE FIELDS RESULTING FROM HEATED WATER DISCHARGES,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
H. Stefan, and T. Skoglund.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 32-47. 12 fig, 1 tab, 11 ref, 1 append.

Descriptors: *Thermal pollution, *Cooling water, *Thermal stratification, *Thermal powerplants, Thermal properties, Heat transfer, Water cooling, *Minnesota, Heated water, *Discharge(Water), Water temperature, Heat budget.
Identifiers: Upper Mississippi River, Lake St. Croix, Minneapolis-St. Paul.

Both physical and biological facts are needed to prevent real thermal pollution damage from heated water discharges to lakes and streams. The problem of obtaining such facts is compounded by

regional climatological and hydrologic conditions, plant operational conditions, and the forms of life in receiving water bodies. Four different cooling water outfalls in the Upper Mississippi River basin were used to show steady-state temperature distributions downstream of the outfall for various seasonal conditions, frequency and amplitude of hourly and daily transitory temperature characteristics, temperature versus residence-time relationships for various flow paths, and modifications of overall temperature levels through the heat budget and stratification. These evaluations of physical effects in a temperature-area-time frame can be useful for further biological interpretation. (See also W75-04213) (Harmeson-ISWS)

SOME CHARACTERISTICS OF COUNTERJET FLOW,
Sir George Williams Univ., Montreal (Quebec).
A. S. Ramamurthy, and L. Robillard.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 62-69. 4 fig, 1 tab, 2 ref.

Descriptors: *Jets, *Mixing, *Waste dilution, Circulation, Turbulence, Nozzles, Orifices, Diffusion, Discharge(Water), Outlets, Flow, Path of pollutants, Waste water treatment.
Identifiers: Jet orientation.

One of the methods of effectively diluting the industrial effluent (pollutant) in a stream is to inject the former as a counter jet into the stream. The orientation of the jet is a pertinent variable that influences the characteristics of the jet's near wake region where mixing occurs. There can be two distinct modes of counter jet flow for any given jet orientation. In one of the modes, the jet oscillates about the plane of symmetry. In the other mode, the jet stays on one side of the plane of symmetry and the mixing process in the jet wake region is drastically reduced. The mode of flow is dependent on the ratio of the jet velocity to the main stream velocity for fixed jet orientations and geometry of the injecting device. (See also W75-04213) (Jess-ISWS)
W75-04217

SOME RESULTS FROM EXPERIMENTAL DATA ON SURFACE JET DISCHARGE OF HEATED WATER,
Pacific Northwest Environmental Research Lab., Corvallis, Oreg.
M. A. Shirazi.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 89-108. 4 fig, 2 tab, 12 ref.

Descriptors: *Thermal pollution, *Heated water, *Jets, *Surface waters, Thermal powerplants, Distribution patterns, Analytical techniques, Dimensional analysis, On-site data collections, Laboratory tests, Flow, Hydraulics, Currents(Water), Discharge(Water), Froude number, Water temperature.

Published laboratory and field data on heated surface jets were compiled from several sources and presented in a unified and easily usable format. Partial analysis of the data was presented to show the general influences of the (a) ambient current, (b) the initial discharge angle, (c) the jet densimetric Froude number and, (d) the jet aspect ratio on the plume trajectory, plume half-width, and centerline temperature. Due to a lack of comprehensive high quality data, it was not possible at this time to specify the precise effects of the ambient current, the jet densimetric Froude number, the aspect ratio, and the angle of discharge on the plume behavior. However, despite the scatter and the elementary nature of the data analysis, the qualitative results appeared to be physically reasonable. They presented a general picture of the plume and were believed to be of considerable utility in the development of mathematical models for surface jets. A complete tabulation of the data was conveniently grouped and identified. (See also W75-04213) (Humphreys-ISWS)

COOLING POND TEMPERATURE PREDICTION,
Towson State Coll., Baltimore, Md. Dept. of Computer Science.
W. L. Graves, Jr.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 120-132. 7 fig, 1 tab, 3 ref.

Descriptors: *Cooling water, *Powerplants, *Water temperature, Thermal power, Thermal powerplants, Simulation analysis, Computer models, Water cooling, Planning, Ponds, Model studies, *Forecasting, *Thermal pollution
Identifiers: Thermoelectric power, Signal theory.

A model was described that predicts temperature responses in the environment that are associated with the operation of a natural gas fueled thermoelectric power generation station. The model is a piecewise computer simulation, limited to closed cooling water systems. The techniques developed may be applicable to larger-class cooling systems. Signal theory methods were used to simplify the digital computer analysis. An optimal data set, from the point of view of information per unit cost, was described for the model. THERMAL POLLUTION ASPECTS IN EUROPE,
Ente Nationale per l'Energia Elettrica, Florence (Italy). Compartimento di Firenze.
F. P. Guli.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 165-179. 6 fig, 35 ref.

Descriptors: *Thermal pollution, *Cooling water, *Thermal powerplants, *Nuclear powerplants, *Europe, Powerplants, Streamflow, Sea water, Energy budget, Water pollution sources, Water pollution effects.

Current energy consumption in Europe was assessed and recent forecasts of future total energy requirements were reported. The cooling potential for conventional steam electric and nuclear power production of European rivers, lakes, and ponds are being assessed on the basis of five indexes: (1) 'power density' which is the ratio of a country's installed thermal power capacity to its area; (2) 'sea coastal availability' which is a ratio of installed thermal power capacity to the country's sea coast length; (3) 'fresh water disposability(I)' which is the ratio between average yearly streamflow originating in a country and its average yearly once-through cooling water withdrawals; (4) 'freshwater disposability (II)' which is the ratio between a country's average yearly streamflow leaving its boundaries and its average yearly once-through cooling water, withdrawals; and (5) 'thermal discharge loading' which is the quotient of a country's yearly average thermal plant heat discharges and its yearly average solar radiation. Because of the steadily increasing demand for electrical energy in all of Europe, the adoption of uniform control regulations was urged and the free exchange of meteorological, hydrological, and ecological data was proposed. REVIEW OF HEATED SURFACE DISCHARGE MODELS APPLICABLE TO RIVERS,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
B. A. Benedict, and L. T. Jones.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 194-203. 6 fig, 12 ref. EPA Grant Nos. 16130 FDQ and R-800613.

Descriptors: *Heated water, *River systems, *Mathematical models, Discharge(Water), Jets, Diffusion, *Thermal pollution, Ecology, Cooling water, Density, Froude number, Drag, Model studies, *Path of pollutants, *Reviews.
Identifiers: Waste heat, Crossflows.

Currently available mathematical models for heated water surface discharges were reviewed. This review showed that four models could be utilized for river systems. Models selected included one jet model by Motz and Benedict; three diffusion models; the Cornell version of the Brooks diffusion model; and the two-dimensional and three-dimensional models presented by Edinger and Polk. In addition, the data from Carter showed promise but had a very limited range of applicability. For each model generalized, nondimensional solutions were developed in graphical form with the quantities of surface area, longitudinal distance, and lateral distance shown plotted against temperature rise. Models were compared for a hypothetical case. Model comparisons generally showed no great difference between two-dimensional and three-dimensional models. The jet model gave results that were similar to those of the diffusion models. (See also W75-04213) (Bhowmik-ISWS)

Degradation(Streams), Model studies, Computers, Environmental effects, Water temperature, Streams, Lakes, *Mathematical models, *Path of pollutants, *Reviews, *Pollutant identification.
Identifiers: *Model topology, Identification structures.

Dynamic mathematical models are required to represent the dynamic nature of the dissipation of thermal pollution in water bodies. The trade-off between sophistication in system modeling and the cost of the analysis is an important consideration in the selection of model topology. For dynamic systems, quasilinearization has proved to be an effective methodology for improving a model's topology. A basic exponential decay of the excess temperature with respect to a particular equilibrium temperature is usually postulated for tackling the temperature prediction problem in the case of streams with assumed one-dimensional, homogeneous flow characteristics. The model input includes mean velocity, exchange coefficient, equilibrium temperature, and boundary conditions. Using more flexible system techniques, the temperature prediction was shown to be very tractable for streams, lakes, impoundments, and other water bodies. Present day computers permit the structuring of data generation and identification-strategy ranking schemes which can complement more traditional model and parameter estimate procedures. THERMAL POLLUTION OF THE GREAT LAKES -- A NON-PROBLEM,
Argonne National Lab., Ill.
P. F. Gustafson.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 217-223. 1 ref.

Descriptors: *Thermal pollution, *Great Lakes, *Cost-benefit analysis, Lake Michigan, Powerplants, Cooling water, Heated water, Water temperature, Water quality, Biological communities, Ecology, Freshwater, Decision making.

The Great Lakes are a significant multipurpose freshwater resource for the United States and Canada. With the growing number of steam-generating plants for electric power being built on both sides of the border, it is not surprising that the Great Lakes are being looked at as a source of condenser cooling water. The Great Lakes have been, and continue to be, subjected in varying degrees to stresses due to human activity along their shores. In some cases there are demonstrable adverse changes in water quality, accompanied by undesirable changes in the biological communities within these waters. Man-made thermal discharges constitute an additional artificial input to the lake system, and have the potential for producing adverse effects. Considerable public concern has arisen in regard to the effects of this thermal pollution. In recent years considerable research has been done on Lake Michigan to determine natural and man-made thermal distributions and their effects upon the biota in the lake. The research underway on the Great Lakes is a necessary step in determining the capacity of the lakes to act as heat sinks without causing unacceptable ecological damage. Cost-benefit analyses are also underway to determine if shifting from once-through cooling to closed-cycle cooling systems would be a wise decision. (See also W75-04213) (Scott-ISWS)
W75-04231

NITRIFICATION IN SOIL-WATER SYSTEMS: A COMPUTERIZED ACTIVATED COMPLEX MODEL,
Bureau of Reclamation, Denver, Colo. Engineering and Research Center.
M. J. Shaffer, and G. R. Dutt.
In: Water for the Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 284-294. 4 fig, 3 tab, 11 ref.

Descriptors: *Nitrification, *Soils, Soil-water-plant relationships, *Soil water, Nitrites, Nitrates, Digital computers, Computer programs, Computer models, Nitrogen fixing bacteria, Fertility, Nitrogen compounds, Great plains, Nitrogen cycle, Incubation, California, Arizona, Soil contamination, Fertilization.
Identifiers: *Typic torriorthent soils, *Typic torrifluvent soils, Nitrifiers.

A computerized model was developed to predict nitrification rates in soil-water systems. Model construction involved the application of activated complex theory together with experimental nitrification rate data provided by an incubation study of two soils. These data indicated that the activated complex has a structure more like NH20H or NH4 (+) than like NO2 (-). The completed model was verified by application of published nitrification data for two soils from the northern great plains. Correlation coefficients of 0.944 and 0.940 were obtained for the individual soils. (See also W75-04213) (Sanderson-ISWS)

MECHANICS OF DISPERSION OF POLLUTANTS IN COASTAL ENVIRONMENT,
Department of Water Affairs, Orania (South Africa).
J. M. Jordaan, Jr.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 307-318. 5 fig, 4 ref.

Descriptors: *Pollutants, *Sea water, *Dispersion, *Mathematical studies, *Effluents, Diffusion, Turbulence, Seashores, Waves(Water), Waste dilution, Coasts, Environment, Surf, Model studies, On-site tests, *Path of pollutants, Water pollution sources.
Identifiers: Mill-pond conditions.

The diffusion process is governed by boundary and initial conditions. In the case of effluent discharging into the marine environment its controls at the release point are known as a slug flow or a continuous discharge. To assess the process governing the diffusion and to predict its further progress mathematically, it is necessary to determine the state of the receiving medium or its capability to disperse the diffusant. Diffusion constants can be measured by slug dosing and by sampling the center of the patch at intervals. The natural processes that control the dispersion in the nearshore regions were studied in a wind-wave channel and in the field. Interpretative conclusions were drawn on the practice of nearshore disposal of effluents. Some of the significant conclusions were: turbulance levels are proportional to wave height squared and reciprocal of wave period; the mass transport of the diffused current increases with distance of travel indicating a regular entrainment over the width of the surf zone; in the mill-pond situation, the effluent remains in a well-defined patch with a clearly defined edge; a safe disposal distance offshore is not less than 2 kilometers for industrial effluents on typical open straight shorelines; and pre-dilution of effluents is advantageous before discharge to guard against the possibility of mill-pond conditions. W75-04237

DEVELOPMENT OF A COMPLETE MATHEMATICAL MODEL FOR DESCRIBING THE POINT BEACH NUCLEAR POWER PLANT THERMAL PLUME,
Limnetics, Inc., Milwaukee, Wis.
D. S. Wu, and B. J. Gallagher.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 319-336. 6 fig, 13 ref.

Descriptors: *Heated water, *Nuclear powerplants, *Condensers, *Cooling water, *Mathematical models, Water quality, Environmental effects, Analytical techniques, Channels, Flow characteristics, *Lake Michigan, Electric powerplants, Equations, Model studies.
Identifiers: *Point Beach Plant, Thermal Plume.

Approximately 20 large electric generating plants in Lake Michigan require more than 1000 cfs of cooling water each for their condenser units. Development of mathematical models for predicting temperature distributions underscores the efforts to help establish water quality guidelines and to design and locate discharge structures so as to minimize adverse impacts on the receiving environment. The Wisconsin Electric Power Company's Point Beach Plant on the west coast of Lake Michigan uses about 1500 cfs of water for condenser cooling and discharges it to the lake through two 35 ft wide and 13.5 ft deep channel flumes. The water temperature rises by about 10C under full load conditions. The governing equations of the four characteristics resulting from a heated discharge in a receiving water body are the equations of continuity, motion, diffusion, and state. The flow field was considered in two parts: the near field where the one-dimensional integral approach is valid, and the far field where the differential approach is applied. Complete mathematical models were developed to cover both the near and far fields. Existing near field models were integrated to the far field models by solving the diffusion equation. The two fields were connected through the consideration of the plume centerline velocity. (See also W75-04213) (Singh-ISWS)

DISPOSAL OF POLLUTED DREDGINGS FROM THE GREAT LAKES AREA,
Northwestern Univ., Evanston, Ill. Technological Inst.
R. J. Krizek, and G. M. Karadi.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 482-491. 3 tab, 6 ref.

Descriptors: *Dredging, *Channel improvement, *Disposal, *Great Lakes, *Sediments, Lake sediments, Pollutants, Dikes, Settling basins, Water pollution, Sediment distribution, Sediment yield, Suspended solids, Deposition(Sediments), Water pollution treatment, Dams, Embankments, Levees, Harbors, Excavation, Navigation, Landfills, Bottom sediments.
Identifiers: *Spoil disposal.

Since much of the spoil dredged from the harbors and waterways around the Great Lakes is classified as polluted, open lake disposal is prohibited. Pursuant to a study of several alternative methods of disposal, technical and economic reasons indicate that the placement of these dredgings in

diked containment areas is the best currently available solution. When properly done, such a procedure can successfully remove pollutants from the lake environment and create new landfill for community or industrial development. However, in order to maximize the potential usefulness of such a landfill, the dredging operation should be properly designed and carried out according to a well planned schedule, but the technical feasibility of obtaining an effective distribution of the dredged materials and accelerating the drying process is governed to a large degree by the difficulties associated with the large scale of the operation. In addition to the pollution related aspects of the dredgings disposal problem, many other factors enter into a comprehensive evaluation of the alternatives, and economic considerations do not clearly justify the use of diked containment areas instead of open water disposal. A SURVEY OF ORGANIC CARBON CONSTITUENTS IN NATURAL FRESH WATERS,
Minnesota Univ., Minneapolis. Dept. of Civil Engineering and Hydraulics.
W. J. Maier, H. L. McConnell, and L. E. Conroy.
In: Water for the Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 500-513. 8 fig, 4 tab, 15 ref, 1 append.

Descriptors: *Organic compounds, *Carbon, *Organic matter, *Testing procedures, Water properties, Inorganic compounds, Decomposing organic matter, Data collections, Measurement, Great Lakes region, *Minnesota, Organic acids, Organic wastes, Water quality, Oxygen sag, Photosynthesis, Seasonal, Flow, Analytical techniques, Anaerobic conditions.
Identifiers: St. Croix. Basin(Minn), St Louis River(Minn).

A one year test program to determine organic and inorganic carbon concentrations in Minnesota's major bodies of water was carried out. Carbon contents were measured with a modified Beckman Carbon Analyzer. The organic carbon concentrations in the major Minnesota river basins range from 7 to 45 mg/l with a mean of 22 mg/l; Lake Superior is the exception and has about 5 mg/l in the near shore area. Seasonal variations and the effects of flow were discussed. Information about sources and composition of naturally occurring organics was reviewed. The results provide some bench marks for assessing present water quality and for use as reference points in evaluating long term trends. (See also W75-04213) (Henley-ISWS)

INTERACTION OF BULK PRECIPITATION, STREAM WATER, AND SEWAGE IN A SMALL WATERSHED NEAR OXFORD, MISSISSIPPI,
Mississippi Univ., University. Dept. of Geology and Geological Engineering.
K. J. Banaszak.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 524-536. 2 fig, 4 tab, 29 ref. OWRR A-063-MISS(2).

Descriptors: *Rainfall-runoff relationships, *Water sources, *Watersheds(Basins), *Surface runoff, *Precipitation(Atmospheric), Rain, Rainfall, Runoff, Streamflow, Streams, Surface water, *Small watersheds, Analytical techniques, Surface drainage, Trace elements, Water analysis, Testing procedures, Sampling, Nutrients, Geologic formations, Heavy metals, Erosion rates, *Mississippi.
Identifiers: Oxford(Miss), Atomic absorption spectroscopy.

A 500 hectare (54% forest, 26% pasture and fallow field, and 20% rural urban) rainfed watershed near Oxford, Mississippi, was studied from July 1, 1972, to June 30, 1973. During this period, 200 centimeters (132 cm are 'normal') of precipitation with an average pH of 4.6 and an average composition in parts per million of 0.66 calcium, 0.04 magnesium, 0.54 sodium, and 0.23 potassium fell. The stream discharge of 80 centimeters had a neutral pH and an average composition in parts per million of 6.4 calcium, 1.5 magnesium, 6.4 sodium, 2.2 potassium, 13 bicarbonate, 12 sulfate, and 5.5 chloride. A sewage influx of 50 liters per second had little noticeable effect on the composition of storm runoff. The reasons for the change from bulk precipitation to stream water are not clear but must involve biologic, aerosol, and anthropogenic material. The change is compatible with a change from a water in equilibrium with gibbsite to a water in equilibrium with gibbsite and kaolinite. The net output for the study period from the watershed in kilograms per hectare-year was 43 for calcium, 12 for magnesium, 44 for sodium, 14 for potassium, and 36 for silica. These outputs are not compatible with earlier studies but are compatible with gross chemical erosion rates. Data for cadmium and zinc were inconclusive. A major study was suggested to determine the true input by aerosols, both natural and anthropogenic, to watersheds. (See also W75-04213) (Henley-ISWS)
W75-04254

WATER QUALITY ASPECTS OF THE 1973 OPENING OF THE MISSISSIPPI RIVER DIVERSION SPILLWAY AT BONNET CARRE, LOUISIANA, U.S.A.,
Army Engineer District, New Orleans, La.
P. G. Combs, and E. P. Russo.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 548-557. 4 fig, 1 tab, 3 ref.

Descriptors: *Diversion structures, *Flood control, *Flood protection, *Levees, *Flood routing, *Mississippi River, Diversion, Floodways, Watershed management, Mississippi River Basin, Drainage systems, Floods, Spillways, Water quality, Flood discharge, Salinity, Aquatic life, Flood data, Estuaries, Sampling, Louisiana.
Identifiers: Bonnet Carre Spillway(La), Nursery area, *Lake Pontchartrain(La).

The Bonnet Carre Spillway is located on the east bank of the Mississippi River approximately 40 km above New Orleans. The spillway consists of 9 km of leveed floodway conveying water from the Mississippi River to Lake Pontchartrain, then into Lake Borgne and into the Gulf of Mexico. In 1973 when it became evident that flood waters would have to be diverted through the Spillway, and since Lake Pontchartrain is considered a nursery area for many marine species, a water quality sampling program was established to document the effect that the diverted water would have on the Lake Pontchartrain estuary. One of the most extensive data gathering programs ever undertaken by the New Orleans District of the Corps of Engineers was initiated with the opening. Visual observations and remote sensing were made by NASA on a daily basis from an altitude of 2440 m, intermittently by NASA-STAR at 20,000 m, and also by means of the Earth Resources Technology Satellite which processed data in four different wavelengths. Results of these remote sensings and ground truth data were compared. Bottle samples were obtained at 70 locations daily and were analyzed for the presence of 28 parameters which included heavy metals, nutrients, bacteria, sediment, etc. In situ measurements of temperature, pH, salinity, and dissolved oxygen were also made at these 70 locations. The progression of the river water through the lake was also given, showing the retarding effects of the extremely high gulf tide that occurred during this period. (See also W75-04213) (Henley-ISWS)

AN ANALYSIS OF OIL OUTFLOWS DUE TO TANKER ACCIDENTS, 1971-1972.
Henry (J.J.) Co., Inc., Moorestown, N.J.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-780 315, $6.25 in paper copy, $2.25 in microfiche. Report No. CG-D-81-74, November 1973. 157 p, 15 fig, 29 tab, 6 ref, 3 append. DOT-CG-31,445-A.

Descriptors: *Oil spills, *Accidents, *Oceans, *Oil pollution, Ships, Damages, Oil, Disasters, Water pollution sources, Evaluation, Data collections, *Path of pollutants.
Identifiers: Ship collisions, Ship groundings, Ship casualty data, Tanker pollution.

An analysis was made of the reported and estimated oil outflow resulting from tanker casualties. The data consisted of 1587 world-wide tanker casualties occurring in 1971-1972, of which 376 incidents involved pollution. Only tanker vessels exceeding 100 GRT were considered. Trend comparisons were shown between this two year period and the 1969-1970 period. Data tabulations of the 376 tanker polluting incidents and the 1587 tanker casualties were presented in appendixes. Available from the National Technical Information Service, Springfield, Va 22161 as AD-778 617, $4.75 in paper copy, $2.25 in microfiche. Technical Note No. 4-74, January 1974. 84 p, 69 fig, 1 tab, 9 ref.

Descriptors: *Currents(Water), *Mathematical models, *Estuaries, *Computer models, Tides, Circulation, Dispersion, Pollutants, Analytical techniques, Hydrodynamics, Numerical analysis, Model studies, New York.
Identifiers: *New York Bight, Two-layer model, Flushing times.

One- and two-layer large grid hydrodynamical-numerical models were applied to the New York Bight. A few current measurements from lightships were used to verify the models. Tidal currents and wind currents were computed to determine overall circulation patterns. Definite differences in current velocity and direction between the upper and lower layers were demonstrated. Diffusion computations for short time periods were not fully satisfactory. The movement of the centers of release points and net transport through various sections were presented. Graphical results were presented to demonstrate the application of the computer models. To a large extent the problem depended on conditions along two long, open boundaries. The specified conditions on these open boundaries were used to tune the results inside the computational region. (Adams-ISWS)

MARINE STUDIES OF SAN PEDRO BAY, CALIFORNIA, PART V; DATA REPORT, TEMPERATURE, SALINITY, OXYGEN AND HYDROGEN ION CONCENTRATION IN OUTER LOS ANGELES HARBOR, JUNE 1971 TO NOVEMBER 1973.
Southern California, University of Los Angeles. Sea Grant Program.
Available from the National Technical Information Service, Springfield, Va. 22161, as COM-74-11122, $4.75 paper copy, $2.25 microfiche. Report No. USC-SG-3-74, February 1974. 76 p, 1 fig, 5 ref. Edited by Soule, D.F., and Oguri, M. NOAA 04-3-158-45.

Descriptors: *Water properties, *Salinity, *Temperature, *Hydrogen ion concentration, *Dissolved oxygen, Sea water, Physical properties, Saline water, Chemical properties, Water quality, Water analysis, Testing, Sampling, Monitoring, Instrumentation, Conductivity, Data collections, Computers, Environment, Harbors, *California.
Identifiers: Marine studies, *Los Angeles Harbor(Calif), San Pedro Bay(Calif).

Data were presented showing the temperature, salinity, dissolved oxygen content, and the pH of the water in the outer Los Angeles Harbor from June 1971 to November 1973. Graphs indicating these water quality parameters were produced by computer plots. Single monthly readings were taken at each station at one meter increments to give profiles of parameters with depth. Each monthly segment showed readings at 0, 5, 10, 15, and 20 meters on the horizontal axis and the appropriate unit of temperature, salinity, dissolved oxygen, or pH on the vertical axis. Dotted lines connected the highs and lows to show seasonal trends, while solid lines between the dotted lines indicated changes in the profile with depth. Complete data, from which the graph points were taken, were presented in computer printout tables. (Henley-ISWS)

EXPERIMENTAL METHODS FOR OBTAINING PERCOL MODEL INPUT AND VERIFICATION DATA,
Battelle-Pacific Northwest Labs., Richland, Wash. Water and Land Resources Dept.
R. J. Serne, R. C. Routson, and D. A. Cochran.
Available from the National Technical Information Service, Springfield, Va. 22161, as BNWL 1721, $4.00 paper copy, $2.25 microfiche. Report No. BNWL-1721, 1973. 38 p, 9 fig, 5 tab, 24 ref. AEC Contract AT (45-1)-2130.

Descriptors: *Model studies, *Basic data collections, *Chemical reactions, *Numerical analysis, Computer programs, Chemical wastes, Cation exchange, Mathematical studies, Physical properties, Hydraulic models, Soil chemistry, Soil analysis, Percolation, Infiltration.
Identifiers: *Model verification data, Equilibrium model.

A soil-waste chemical equilibrium model, PERCOL, was developed to numerically simulate the complex chemical reactions that occur while a solution is percolating through porous media. Procedures for measuring the many parameters and necessary input data were described. To validate the PERCOL model, small experimental columns were packed with soil and simulated waste solutions were pumped through the columns to approximate percolation. The effluent solution was serially collected and its chemical composition determined and compared with PERCOL's predictions. The column verification methods were described. Parameters measured included soil cation-exchange capacity, soil cation selectivity constants, soil apparent porosity, soil moisture content, soil bulk density, trace constituent sorption constants, sparingly soluble salt content, soluble salt content, and influent and effluent solute chemical composition. Water Pollution Control, Vol 73, No 4, p 417-424, 1974.

Descriptors: *Water pollution sources, *Effluents, *Sea water, Phenols, Cyanide, Toxicity, Colloids, Suspended solids, Discharge, *Sewage disposal, Coastal areas, Industrial wastes, Oxidation, Chemical pollution, Dissolved solids, *Waste water disposal.
Identifiers: *Marine disposal systems, Buoyant materials, Settleable solids, Intermediate solids.

Marine disposal should be undertaken as economically as possible consistent with the proper protection of the public health, as well as the minimum damage to amenity, recreational and industrial use of the receiving waters and the minimum waste of natural resources or disruption of the environment. The inland disposal of polluting discharges must inevitably mean disposal into the sea, since waters flowing through almost all lakes, streams and rivers eventually reach the seas. The oceans, it can be assumed, have become progressively polluted with a variety of chemical salts amounting to some 34,000 mg/liter total dissolved solids. Many of the naturally derived chemicals occurring in waste discharges are amenable to sea degradation; acids and alkalis are rapidly dispersed by the sea, while toxics such as phenols and cyanide compounds are rapidly degraded if prior to discharge they have been properly diluted. Buoyant materials are not easily broken down, and by surface wind action are liable to return to the shoreline, creating unsightly pollution. The greatest amount of pollution is discharged in solution or colloidal suspension, including the liquid fraction of sewage and industrial wastes. Stable toxins must not be discharged except as trace contaminants. (Leibowitz-FIRL)

Identifiers: Agrobacterium-Radiobacter, *Bacterial cells, *Clay minerals, *Electro-kinetics, *Microbial activity, Minerals, Sewage, *Soil treatment, Soil applications.

A complex mixture of fermentation residues and eutrophication products used commercially as a soil amendment and in various phases of sewage treatment was effective in reducing the electrophoretic mobility of clay minerals (kaolinite and montmorillonite) and cells of Agrobacterium radiobacter. The active fraction(s), which is active at very low concentrations, appears to be a stable (to heat, dialysis, concnetration, and storage), net negatively charged polymer which may have several positively charged sites. The material does not significantly alter the viscosity or surface tension of aqueous systems and is probably a microbial metabolite(s).--Copyright 1974, Biological Abstracts, Inc.

SULFATE REDUCTION AND SULFIDE OXIDATION IN FLOODED SOIL AS AFFECTED BY CHEMICAL OXIDANTS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Office of Dredged Material Research.
R. M. Engler, and W. H. Patrick, Jr.
Soil Sci Soc Am Proc. Vol 37, No 5, p 685-688. 1973, Illus.
Identifiers: *Anaerobic conditions, *Chemical oxidants, *Flooded soils, Oxidation, Redox, Soils, *Sulfate reduction, *Sulfide oxidation, Sulfur.

The effect of various chemical oxidants on inhibition of sulfide (S2-) in a previously reduced soil was studied. O2, KNO3, MnO2, ferricitrophosphate, and FePO4 . 2H2O at rates equivalent to 1000 ppm O2 (O2 added at rates of either 300 or 500 ppm) were both added prior to flooding and after soil reduction had reached a maximum. The more soluble oxidants had the greatest effects in maintaining more positive redox potentials and in delaying sulfate (SO42-) reduction to S2-. The soluble oxidants (KNO3 and ferricitrophosphate) delayed S2- production by 17 and 9 days, respectively. The less soluble compounds (MnO2 and FePO4 . 2H2O) were less effective in delaying S2- production but persisted longer in preventing maximum S2- buildup. Adding the oxidants after maximum S2- accumulation showed the most pronounced effect on S2- oxidation from KNO3 and the least effect from MnO2. O2 at the rate of 500 ppm was also a very effective oxidant. Sulfate reduction to S2- and S2- oxidation were apparently controlled by, or at best related to the redox potential since SO42- reduction and S2- oxidation both appeared to commence at potentials in the vicinity of -100 mV.--Copyright 1974, Biological Abstracts, Inc.

CONVERSION OF DDT TO DDD IN FLOODED SOIL,
Bangladesh Agricultural Univ., Mymensingh. Dept. of Soil Science.
Z. H. Bhuiya, and D. F. Rothwell.
Plant Soil. Vol 39, No 1, p 193-196. 1973.
Identifiers: *Anaerobic conditions, *DDD, *DDT, Dechlorination, *Flooded soils, Insecticides,

Microbial, Soil moisture, Water pollution sources, Pesticide residues.

Anaerobic conditions obtained by flooding the soil caused reductive dechlorination of p,p'-DDT and its conversion to p,p'-DDD was enhanced under waterlogged conditions creating or favoring anaerobiosis. The DDT showed recalcitrance in the soil kept at 15% moisture. More o,p'-DDT was lost from the flooded soil. Similar amounts of p,p'-DDE were detected in all of the 3 levels of technical DDT treatments and the concentrations were not significantly different under both aerobic and anaerobic conditions.--Copyright 1974, Biological Abstracts, Inc.

HEAT DISSIPATION FROM TURBULENT OPEN CHANNEL FLOW,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
P. G. Mayer, and M. D. Moss.
In: Water For The Human Environment, Volumen IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 492-499. 2 fig, 11 ref. OWRT A-048-GA(1).

Descriptors: *Thermal pollution, *Heat balance, *Turbulent flow, *Heat flow, *Open channel flow, *Cooling, Water cooling, Hydrothermal studies, Heat transfer, Heated water, Turbulence, Energy transfer, Evaporation, Mathematical studies.
Identifiers: *Heat loss, Karman-Prandtl coefficients.

The advantage of using open channel flow for heat dissipation was proposed. It was indicated that the design of rough open channels resulting in highly mixed flows may be a viable alternative to cooling towers and conventional cooling ponds. an examination was made in terms of increased thermal transport due to an increased surface temperature from mixing near the surface in turbulent open channel flow. A determination of the additional thermal transfer to be obtained by mixing was suggested in terms of the evaporative cooling as a function of surface temperature increase. (Jess-ISWS)

EFFECTS OF TEMPERATURE ON THE TOXICITY TO THE AQUATIC BIOTA OF WASTE DISCHARGES-A COMPILATION OF THE LITERATURE,
Utah Water Research Lab., Logan.
E. J. Middlebrooks, M. J. Gaspar, R. D. Gaspar, J. H. Reynolds, and D. B. Porcella.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-239 127, $6.25 in paper copy, $2.25 in microfiche. Publication PRWG105-1, October 1973. 170 p, 1 tab, 1,289 ref. OWRR B-070-UTAH(4). 14-31-0001-3659.

Descriptors: *Thermal pollution, *Toxicity, Bioassay, Temperature, *Water temperature, Bioindicators, *Reviews, *Bibliographies, Aquatic environment, Waste water(Pollution), Laboratory tests, Biota, Water pollution effects.
Identifiers: *Temperature-toxicity relationships, Experimental design.

An extensive compilation and general evaluation of the literature is presented which describes the temperature interaction with toxicity. Recent literature is summarized and made accessible along with a few generalized relationships such that researchers may design studies in a manner that will increase the utility of their results. A detailed indexing system is employed which makes the information contained in the report accessible by author, toxicant, and test organism. Summary tables of the most pertinent literature are also presented for easy subject retrieval. It was concluded that very little uniformity in experimental design is found between experiments on temperature-toxicity relationships, and a generalized summary of the results presented in the literature is essentially impossible because of the inconsistencies in experimental designs. The utilization of standard bioassay procedures is highly recommended, and these procedures should be applied to experimental designs which allow the estimation of parameters related to the theoretical effects of temperature.

FURTHER OBSERVATIONS ON ENDEMIC FLUORIDE-INDUCED OSTEOPATHIES IN CHILDREN,
L.L.R.M. Medical Coll., Meerut (India). Dept. of Human Metabolism.
M. Teotia, and S. P. S. Teotia.
Fluoride. Vol 6, No 3, p 143-151. 1973.
Identifiers: Diagnosis, Endemic areas, *Fluoride, *Fluorosis(Skeletal), *Osteopathies, Human diseases, *Public health.

Fluoro-osteopathy is described in 4 children aged 6 or above. These observations contrast with the concept that skeletal fluorisis cannot develop prior to 10-20 yr of high fluoride intake. The pathogenesis and the mechanism underlying the causation of this disease is discussed on the basis of the occurrence of skeletal fluorosis in growing children. Since skeletal fluorosis is a preventable disorder, it must be recognized or considered in the differential diagnosis of each bone and joint disease in a child residing in an endemic area.--Copyright 1974, Biological Abstracts, Inc.

THE BIOCHEMICAL OXYGEN DEMAND OF FINELY DIVIDED LOGGING DEBRIS IN STREAM WATER,
Oregon State Univ., Corvallis.
S. L. Ponce.
Water Resources Research, Vol 10, No 5, p 983-988, October, 1974. 4 fig, 6 tab, 9 ref.

Descriptors: *Biochemical oxygen demand, *Lumbering, Natural streams, *Wood wastes, *Water pollution effects, *Dissolved oxygen, Leaves, Toxicity, Water pollution, Fishkill, Water pollution sources, Industrial wastes, Water quality, Softwood, Forests, Coniferous trees, Hardwood, Deciduous trees.
Identifiers: Twigs, Needles, Douglas-fir(Pseudotsuga menziesii), Hemlock(Tsuga), Alder(Alnus), Logging residues.

The impact of Douglas-fir needles and twigs, western hemlock needles, and red alder leaves on dissolved oxygen and thus on the quality of mountain stream water was examined. The mean COD, 90-day BOD, and BOD rate coefficients were, respectively, 454 mg 0/g, 110 mg 0/g, and 0.125 for Douglas-fir needles; 947 mg 0/g, 110 mg 0/g, and 0.056 for Douglas-fir twigs; 570 mg 0/g, 200 mg 0/g, and 0.049 for western hemlock needles; and 882 mg 0/g, 286 mg 0/g, and 0.047 for alder leaves. Further analysis showed that the 90-day values for BOD and K (reaction rate coefficient) could be estimated accurately by tests of shorter duration: 20 days for Douglas-fir needles, 20 days for hemlock needles, and 60 days for alder leaves. Leaf material exposed to fluctuating temperature exerted a 5-day BOD 4.0, 2.4, and 4.2 times greater than the standard temperature 5-day BOD for Douglas-fir needles, hemlock needles, and red alder leaves, respectively. The toxicity of a leachate extracted from each species was determined on guppies and steelhead trout fry. The concentration of leachate needed to produce toxic effects was so high that oxygen depletion probably would be responsible for death long before the leachate effect. The results of this study, combined with reaeration and debris accumulation studies, will enable foresters to predict on-site and downstream dissolved oxygen levels with time after the introduction of a known amount of logging slash. (Witt-IPC)

THE THERMAL REQUIREMENTS AND TOLERANCES OF KEY ESTUARINE ORGANISMS,
Maryland Univ., Prince Frederick. Center for Environmental and Estuarine Research.
J. A. Mihursky, V. S. Kennedy, A. J. McErlean, W. H. Roosenburg, and A. J. Gatz.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 073, $6.25 in paper copy, $2.25 in microfiche. Technical Report No 26. Maryland Water Resources Research Center, College Park, (1974), 146p. OWRT A-011-MD(5), A-002-MD(15), 14-31-0001-3020.

Descriptors: *Thermal pollution, Water pollution effects, *Chesapeake Bay, *Water temperature, Data collections, *Estuarine fisheries, Model studies, Bays.
Identifiers: Thermal effects, *Estuarine organisms, Steam electric stations, Pumped-entrainment, *Thermal tolerance, Species diversity indices.

The research program employed temperature as a major variable in exploring effects on estuarine organisms under both single variate and multivariate experimental designs. Laboratory data were developed for 10 species common to the Chesapeake Bay region, using three basic approaches: (1) temperature effects on mortality; (2) temperature effects on performance, and (3) temperature effects on metabolic activity. Multivariate experiments used time as well as temperature as major variables. This latter approach addressed the question of pumped-entrainment effects on organisms contained in steam electric station cooling water supplies. An analysis was also completed on field data dealing with an estuarine fish community response to a thermal discharge from a steam electric station. Various species diversity indices were developed and compared for a two year pre-operational and a two year post-operational period of the steam electric station. Laboratory data demonstrated that under summer conditions, for typical Chesapeake Bay species, approximately 32C tended to be a thermal 'break point', in that temperatures above 32C tended to exceed tolerance limits of the organisms. Results of the multivariate temperature-time experiments on molluscan earlu life history stages (cleavage stages, trochophone larvae and straight-hinged veliger larvae) demonstrated the need for steam electric station operational designs to keep temperature increases and time exposures to a minimum in order to assure maximum survival. The earliest life history stage (cleavage stage) had the greatest sensitivity to increased temperature. Data were used to develop a thermal biotic predictive model for an estuarine system. Application of data in combination with steam electric station design and operating knowledge plus certain other environmental information on the Chesapeake

Bay system was used to provide an ecological basis for a regional planning scheme.

AN EXPERIMENTAL BASIS FOR MAXIMAL PERMISSIBLE CONCENTRATIONS OF PATORAN IN SURFACE WATERS, (IN RUSSIAN),
Research Inst. of Labor Protection and Occupational Diseases, Sofia (Bulgaria).
S. P. Novakova, S. Dinoeva, and S. Danon.
Gig Sanit. 38(3): 86-89. Illus. 1973.
Identifiers: Blood, Cell, Enzymes, Equilibrium, Inhibition, Kidney, Liver, Microorganisms, Oxidation, *Patoran, *Pesticide residues, Rat, Respiration, Spleen, Surface waters, *Lethal limit, *Toxicity, *Organoleptic properties, Water pollution effects.

The toxic effect and the permissible concentrations in water of the pesticide patoran (N-4-bromphenl-N'-methyl bromide) were studied. Tests at concentrations of 0.125, 0.25, 0.5, 1, 2, 4, 8 and 16 mg/1 revealed that patoran has an adverse effect on the organoleptic properties of water. A threshold was observed at 0.2 mg/1. Concentrations up to 20 mg/1 did not affect the self-purification of reservoirs. At a concentration of 50 mg/1, patoran prolonged the existence of microorganisms. In acute experiments in rats, the LD50 was 3875 mg/kg. In acute and semiacute experiments, patoran inhibited tissue respiration and oxidative-reductive processes in cells and led to toxic damage to liver, kidneys and spleen, including a tendency toward development of cirrhosis of the liver. Chronic experiments in 210 white rats over a 6 mo. period under 5 experimental conditions at daily doses of 0.1-80 mg/kg revealed that above 0.1 mg/kg, patoran adversely affected white and red blood cells, disturbed enzyme equilibrium, inhibited tissue respiration and cellular oxidation-reduction processes and affected the liver, kidneys and spleen. Changes were dose-related. The limiting sign of damaging effects of patoran is its influence on the organoleptic properties of water. It is concluded that 0.20 mg/1 is the maximum permissible levels of patoran in reservoirs.--Copyright 974, Biological Abstracts, Inc.

THE TOXICITY OF 2, 3, 7, 8-TETRACHLORODIBENZO-P-DIOXIN (TCDD) IN GUPPIES (POECILIA RETICULATUS PETERS),
Forest Service (USDA) Corvallis, Oreg. Forestry Sciences Lab.
J. A. Norris, and R. A. Miller.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 1, p 76-80, July, 1974. 1 fig, 2 tab, 18 ref.

Descriptors: Fish, *Herbicides, Pollutants, *Toxicity, Chemicals, 2,4,5-T, Brush control, Analytical techniques, Water pollution effects, Mortality, *Path of pollutants, Organic compounds.
Identifiers: *Guppies, *Poecilia reticulatus, *TCDD.

The compound 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) is a contaminant of the herbicide 2,4,5,-trichlorophenoxyacetic acid. TCDD is immobile, slowly degraded in soils, not taken up readily by plants, subject to photodecomposition, low in water solubility, and highly toxic and teratogenic in mammals. This experiment determined the characteristics of TCDD in guppies. Exposure of the guppies to 0.1, 1.0 and 10.0 ppb TCDD for 120 hours caused complete mortality in the following 32, 21, and 30 days, respectively. The suggested reason for the apparent decrease in toxicity between 1.0 and 10.0 ppb TCDD is that fish in the 1.0 ppb TCDD concentration may have been exposed to supersaturated levels of TCDD. There was a significant positive correlation of duration of survival with the body length. (Orr-FIRL)

Descriptors: *Biodegradation, Aldrin, *Pesticides, DDT, *Sunfishes, *Toxicity, Biochemistry, Water pollution effects, Pesticide residues.
Identifiers: *DDT analogues, *Methoxychlor, Green sunfish, Trifluralin, *Carbofuran.

The aquatic persistence, toxicity, and biodegradability of DDT, methoxychlor, and 28 analogues were evaluated using the green sunfish Lepomis cyanellus. Study of DDT analogues with degradophores located in aryl or alkyl moieties of the DDT-type molecule showed that the toxicity to and persistence of these compounds in the green sunfish is correlated with the environmental temperature of exposure and ability of multi-function oxidase enzymes of the fish to attack specific chemical groupings on various parts of the molecule. The green sunfish can readily oxidize alkyl and methylthio groups of the aryl portion of the molecule to water partitioning moieties but alkoxy groups are not as readily attacked. Persistent and highly insecticidal DDT molecules can be developed which have greatly reduced toxicity to fish. The biochemical role of the multi-function oxidase enzymes in biodegradation of pesticides in the green sunfish was explored in detail using the oxidase inhibitor piperonyl butoxide together with radiolabeled methoxychlor, aldrin, and trifluralin. The reactions which were inhibited were 0-demethylation, N-dealkylation, and epoxidation. Where piperonyl butoxide was present, the fish accumulated from 15 to 45 times more of the parent compound, over a 16-day period.

ENHANCEMENT OF RECREATIONAL USES OF ESTUARINE WATERS THROUGH STUDY OF POTENTIAL CONTROL METHODS FOR STINGING SEA NETTLES,
Maryland Univ., Solomons. Natural Resources Inst.
D. G. Cargo.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 226, $3.25 in paper copy, $2.25 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No. 23, (1974). 12 p. OWRT B-002-Md(1). 14-01-0001-1055.

Descriptors: *Sea nettles, Chesapeake Bay, Chrysophyta, Cyanophyta, Water temperature, Food chains, Growth rates, Spawning, Reproduction, Thermal stress, Jelly fish.
Identifiers: *Chrysaora, *Cyanea, Polyps, *Nudibranch, Medusa growth, Ctenophores, Mnemiopsis, Scypistoma.

A number of laboratory and field oriented experiments and observations are described. Temperature tolerance of polyps of the sea nettle showed that they encyst at 4C and again at 35C. Most polyps set on the under sides of substrates. Predation upon polyps by the nudibranch Coryphella pellucida is revealed. Observations on the winter jellyfish showed that this species is seasonally opposite to the summer nettle and has all the same stages. Growth of medusae, variation in seasonal abundance and setting patterns of planula larvae were examined. Maximum growth observed was from 3 mm to 170 mm in 33 days. Peaks of abundance and spawning take place in late July and early August. A laboratory experiment showed that the ctenophore is an acceptable and nutritious food for sea nettles.

Descriptors: Water pollution effects, *Bioassay, *Toxicity, Bioindicators, Industrial wastes, *Phenols, *Kinetics, *Mathematical models, *Algae, Temperature, *Thermal pollution, Inhibition, Enzymes, Model studies.
Identifiers: Chemostat, Oil refinery wastes, Enzyme inhibition, Competitive, Non-competitive inhibition, *Selenastrum capricornutum.

Many industries, such as pulp and paper mills, tanneries, and oil refineries, discharge toxic wastes at extremely high temperatures. The temperature of an oil refinery waste may range from 22C (71F) to 41C (106F). These high temperatures could have a significant effect on the toxicity of a given waste. Therefore, it is necessary to develop relationships which will evaluate and predict the effects of increased temperature on the toxicity of various wastes. Equations have been developed utilizing continuous flow stirred tank reactor (chemostat) kinetics and enzyme inhibition kinetics to describe the effects of temperature on toxicity to microorganisms. These equations were tested by semicontinuous and continuous flow experiments with phenol and the algae Selenastrum capricornutum. The data obtained were fitted to competitive, uncompetitive, and non-competitive inhibitor models. The results indicated that phenol exerts a competitive inhibition effect on the growth of S. capricornutum. Comparison of the competitive inhibition constants, KI, for S. capricornutum exposed to phenol at 20C, 24C, and 28C, indicates that phenol toxicity increases with an increase in temperature according to the Arrhenius function.

Water Pollution Control, Vol 73, No 4, p 396-405, 1974. 3 fig, 13 tab, 3 ref.

Descriptors: *Water pollution, *Effluent control, *Fishkills, *Industrial wastes, *Trout, Rivers, Toxicity, Sewage effluents, Rainbow trout, *Toxicity, *Brown trout.
Identifiers: *Trent River Authority(UK).

An intensive investigation resulted in the conclusion that unidentified complex organic compounds originating at the chemical manufacturing industry around Loughborough were killing the fish population in the lower part of the Soar River, a tributary of the Trent. A toxicity test was developed between 1965-1969 for an examination of the effluents in the Trent River Authority area. A modified version of the Standard test recommended by the Ministry of Housing and Local Government involved the following procedures: the test species was changed from brown trout to rainbow trout because of the availability and the standard length of 60 and 150 mm for the tested fish; the temperature used during the tests was increased from 10 degrees C to 15 degrees C because of easier attainability; and, the dilution water was standardized, with a choice of either hard (250 mg/liter) or soft (25 mg/liter) water being recommended so that the one which most closely approximates the receiving water can be chosen. Several industrial waste water discharges to sewers were tested on behalf of sewage works to trace the toxicity source in their effluents, or the cause of operational problems such as the inhibition of sludge digestion and the reduced efficiency of aerobic processes. THE MORPHOEDAPHIC INDEX, A FISH YIELD ESTIMATOR--REVIEW AND EVALUATION,
Ontario Ministry of Natural Resources, Thunder Bay. Fish and Wildlife Research Branch.
R. A. Ryder, S. R. Kerr, K. H. Loftus, and H. A. Regier.
Journal of the Fisheries Research Board of Canada, Vol 31, No 5, p 663-688, May, 1974. 6 fig, 107 ref.

Descriptors: *Dissolved solids, *Yield equations, *Fish populations, Statistics, Depth, Reviews, Evaluation, Estimating.
Identifiers: *Morphoedaphic index, Angling yield, Commercial fish yield, Mean depth.

The morphoedaphic index (MEI), a fish yield estimator, was reviewed and evaluated. Background papers leading to the development of the MEI and more recent advances were discussed. The MEI was defined and its criteria for use examined. The significance of its components - total dissolved solids and mean depth - was explained. A comparison between the MEI and related models was also made. The global range of the MEI was outlined as well as restrictions on its use. Sustained fish yields at different MEI values for various climatic regions were predicted. Several special applications of the MEI include: prediction of angling yield in north-temperate lakes; prediction of commercial fish yield on a newly created reservoir; indication of ecological stresses and changing environments; and contrasting responses to cultural eutrophication in the littoral and profundal zones of lakes. The implications of the MEI for ecological theory were discussed. (Orr-FIRL)

INTERACTIONS BETWEEN LIGHT AND CARBON DIOXIDE AVAILABILITIES AS A CONTROL OF ALGAL SPECIES SUCCESSION,
Missouri Univ., Columbia. Dept. of Civil Engineering.
D. L. King, and R. King.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-239 284, $4.75 in paper copy, $2.25 in microfiche. Missouri Water Resources Research Center, Columbia, Completion Report, June 17, 1974. 74 p, 32 fig, 6 tab, 14 ref, 2 append. OWRT A-071-MO(2). 14-31-0001-4025.

Descriptors: *Algae, *Carbon dioxide, Light, *Photosynthesis, *Growth rates, Anabaena, Scenedesmus, *Algal control.
Identifiers: *Algal species succession, Pediastrum biradiatum, Phormidium.

The primary objective was to evaluate the role played by the interaction between light availability and a carbon dioxide source for algal photosynthesis. Algae used included Pediastrum biradiatum, Phormidium olivacea, Anabaena variabilis, and Scenedesmus acutiformis. The growth kinetics of all four algae were shown to follow the Mowod model under high free carbon dioxide concentrations (CO2f) and variable light intensity, but under high light intensity and variable CO2f the growth kinetics fit the Monod model well only at high CO2f. However, the limit on specific growth rate imposed by CO2f availability and the limit imposed by light intensity were shown to interact in a multiplicative manner for all four algae. While correlation coefficients between measured and calculated specific growth rates for the four algae ranged from .96 to .99; each alga differed in its ability to compete under conditions of changing light and changing CO2f as well as under variations in the product of these two variables.

SYMPOSIUM ON POPULATION EXPOSURES,
Health Physics Society, East Weymouth, Mass.
Available from the National Technical Information Service, Springfield, Va. 22161, as CONF-741018, $10.60 in paper copy, $2.25 in microfiche. CONF. 741018 Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, Oct 21-24, 1974, Knoxville, Tennessee, 446 p.

Descriptors: *Public health, *Radioactivity, *Nuclear powerplants, *Energy, Physics, Radiation effects, *Human population, Environment, Environmental effects, Path of pollutants, Measurement, Assessment, Safety, Evaluation, Fuels, Gases, Waste disposal, Hazards, Toxins, Toxicity.
Identifiers: *Population exposure.

The Eighth Midyear Symposium provided an opportunity for consideration and discussion of technical questions involving (i) potential adverse effects that the nuclear power industry may have on the environment, (ii) pathways that various radionuclides follow in the biosphere when released in air or water, (iii) the relationship of such information to other radiological hazards, and (iv) environment problems associated with the alternative fossil-fuel production of electricity. Although the primary emphasis is on radiation, exposure to non-radioactive environmental pollutants resulting from power generation was also discussed. (See W75-04153 thru W75-04194) (Houser-ORNL)

THE HISTORICAL DEVELOPMENT OF CONCEPTS OF RADIATION DOSE COMMITMENT,
Office of Radiation Programs, Washington, D.C.
A. C. B. Richardson.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tenn., p 1-8, 19 ref.

Descriptors: *Radioactivity, *Human population, Mathematics, *Public health, Nuclear explosions, Fallout, Environment, Safety, Evaluation, Assessment.
Identifiers: Dose, *Dose commitment, Weapons testing, *Population exposure.

Calculations of future doses to individuals from ingested radioactive materials, both for estimating the consequences of radiopharmaceutical use and in connection with occupational exposure guidance, provide the firs examples of the use of the concept of dose commitment. In 1958 Lindell introduced expanded concepts which later developed into the United Nations Scientific Committee on the Effects of Atom Radiation (UNSCEAR) definition of 'dose commitment' in order to provide a measure of the public implication of fallout from atmospheric weapons testing. Recently, even broader concepts, variously termed the 'environmental dose commitment' and the 'collective dose commitment,' have been developed which encompass the total population impact of environmental levels of radioactive materials. The historical development, interrelationship, and functions of these concepts are examined with a view to defining their most useful present roles in radiation protection. Identifiers: *Dose, Weapons testing.

Estimates of population doses to ionizing radiation have been made by official and unofficial groups for at least 25 years. The general use of such estimates falls in two categories (1) establish the relative importance of different sources of population exposure to radiation and (2) technology assessment. The concept of the Dose Commitment was introduced by the United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) in 1962 as a basis for evaluating the public health significance of fallout from nuclear weapons testing and is defined as the population dose accumulated over 'infinite' time associated

with one unit of practice. Using appropriate transport, uptake of physiological models, the integral dose to relevant tissues was calculated and the resulting estimate is representative of the mean dose to relevant tissues of the world population associated with complete decay of relatively long-lived nuclides such as 90Sr and 137Cs. Identifiers: *Brazil.

To investigate the possible dose-effect relationship of populations subjected to chronic, low level ionizing radiation, a multifaceted radiological analysis of the high background area in Guarapari is under way. Although its 12,000 population will not exhibit epidemiological manifestations, elevated rates of chromosome aberrations in the peripheral lymphocytes are observed when compared to a control population with a similar water and food supply. The chromosome break structure and the local presence in Guarapari of monazite sand containing up to 6% thorium and 0.3% uranium suggest an inhaled contamination due to alpha emitting radionuclides. A compatible study in a Rio de Janeiro gas mantle (Th02) factory was initiated to calibrate in an average way, the highly varying radiation environment of Guarapari. Here, 212Pb attached to submicron aerosols give concentrations up to 4 pCi/1 of air, and workers in this type of environment are observed to have chromosome aberrations rates higher than Guarapari. The resulting temporary body burdens have been assessed by extensive whole-body counting as a function of average air quality and time spent in and out of the factory. It shows daily variations with associated air concentrations, partial decay during off work hours and complete decay to individual backgrounds over a weekend period. A generalized phantom capable of modeling a wide variety of internally distributed radionuclides was developed to calibrate these temporary body burdens. Preliminary results for the average dose/work-year delivered to the cellular fraction of the blood as a critical organ are presented, and its implication on the cytogenetic and Guarapari studies are discussed. DOSIMETRY OF INTERNAL EMITTERS FOR POPULATION EXPOSURE,
Oak Ridge National Lab., Tenn.
W. S. Snyder.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 235-250, 6 fig, 3 tab, 22 ref.

Descriptors: Radioactivity, *Radioactivity effects, *Fallout, *Air pollution, *Water pollution, *Food chains, Diets, Milk, Foods, Social aspects, Economics, Cesium, Iodine, Strontium, Retention, Potable water, *Human population.
Identifiers: Age effect, Dose rate.

A population consists of fetuses, infants, children, adults, and the aged, yet the dosimetry of internal emitters for a population is usually based on the dose appropriate for an adult. This paper examines in some detail whether or not this practice is justified. The dimensions of the body and the masses of the organs vary by an order of magnitude or more with age; this changes the dose rate per photon by one or two orders of magnitude. The dose rate from electrons and alpha particles is generally inversely proportional to the mass of the organs; this also produces differences of an order of magnitude or more in different individuals. Fortunately, intakes of air, fluids, and food are, to some extent, proportional to body mass. However, if contamination is limited to water, milk, or certain foodstuffs, differences of intake with age or with socio-economic groups may be present. Additionally, there are differences in retention of the various radionuclides and their compounds which may greatly influence the total dose received. There is considerable evidence that infants and children have a shorter cesium and iodine biological half-time than adults. Changes of retention with age are indicated also for strontium, although the net effect is not so clear. Judged by the data on fallout, the net effect of dietary factors and retention does not appear large--perhaps a factor of two in the total dose received, except for iodine. However, for short-term intake the difference may be larger. (See also W75-04152) (Houser-ORNL)

A METABOLIC MODEL FOR WHOLE BODY AND GI TRACT RETENTION IN A HUMAN INFANT DEDUCED FROM EXPERIMENTAL DATA ON SUCKLING RATS ADMINISTERED A SINGLE ORAL DOSE OF CERIUM-141 AT DIFFERENT AGES,
Oak Ridge National Lab., Tenn.
S. R. Bernard.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 267-274, 6 fig, 4 ref.

Descriptors: *Radioactivity, *Cerium, *Air pollution, *Water pollution, Absorption, *Human population, *Food chains, Retention, Radioactivity effect, Research and development, Model studies, Biology, Metabolism.
Identifiers: Population exposure, Dose, Inhalation, Ingestion, Age effect, GI tract.

Inaba and Lengemann (1972) administered single oral doses of 141Ce(NO3)3 via a stomach tube to nonfasted rats of ages 0, 7, 14, and 25 (weaned) days. They measured total body retention in all pups and GI tract retention in the pups dosed at birth. Over an interval of one month, when there is negligible loss of 141Ce from organs in the total body minus the GI tract and contents, the fractional retention in the total body is approximately given by the complement of a 20-term, cumulative, Poisson function, plus a constant. For fractional retention in the gut and contents, a formula is given which assumes permanent fixation of a fraction fg(A) in the gut walls. The parameters fg(A) and lambda A depend on the age at the time of administration of the 141Ce(NO3)3. In the formula, (lambda A t) to the 0 power for t = 0 is taken as unity. The model has been extrapolated to human retention. Dose has been estimated for a single intake of 1 micron Ci of 141Ce(NO3)3, assuming complete absorption of beta energy in the walls. The dose was about 6 rad if ingestion occurred at birth. The retention in the gut wall was taken as constant after 180 days, but the dose due to this retention was about 0.03 rad. The model and the dose estimate and its uncertainties are discussed. (See also W75-04152) (Houser-ORNL)

AGE FACTORS FOR DOSE RATES FROM AN INFINITE CLOUD OF A PHOTON EMITTER,
Oak Ridge National Lab., Tenn.
J. W. Poston, W. S. Snyder, and G. G. Warner.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 275-282. 4 fig, 2 tab, 5 ref.

Descriptors: Radioactivity, *Radioactivity effects, *Krypton, *Xenon, *Assessment, Age, Growth stages, Human population, Public health, Research and development, Model studies, Biology, Biocontrol.
Identifiers: Infinite cloud, Photons, *Population exposure, *Dose rate, *Age effect.

Estimates of dose to many of the various organs of the body have been given for an adult immersed in an infinite cloud of a photon emitter (Health Phys. 26, 287, 1974). Similar results are now available for phantoms representing individuals of ages 0 (newborn), 1, 5, 10, and 15 years of age. The ratio of the dose rates received per microcurie-hour of exposure of the younger individuals to that for the adult is examined. The results can be expressed as a set of curves, one for each target organ, and for the different ages. In general, the ratios are higher for the younger individuals and for the newborn are frequently higher by a factor of 10 or more. There are a number of departures from this simple generalization which can be interpreted in terms of depth of the organ below the surface of the body, photon energy, etc. These curves are convenient for calculation of the doses received by various segments of the population or for estimation of the average dose received by a population from an infinite cloud source. Examples are given for 85Kr and 133Xe. (See also W75-04152) (Houser-ORNL)

HEALTH EFFECTS OF FOSSIL FUEL POWER PLANTS,
Brookhaven National Lab., Upton, N. Y.
L. D. Hamilton, and S. C. Morris.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 305-316. 4 tab, 14 ref.

Descriptors: *Electric powerplants, *Fossil fuels, *Effluents, *Environment, *Coals, Effects, *Air pollution, *Water pollution, Public health, Assessment, Evaluation, Morbidity, Mortality, Epidemiology, Research and development.
Identifiers: Fuel cycle.

Most efforts to estimate national health and environmental effects of the energy system or their costs have proceeded from an overall estimate to an allocation of these costs to different portions of the energy system. Such analyses have not been realistic because they have not taken into account the varying ways in which emissions and resource uses produce effects; moreover, they have not been representative enough of local diversities. The Biomedical and Environmental Assessment Group of Brookhaven National Laboratory (BEAG) will estimate effects in specific circumstances, taking into account known variables, that will then be aggregated for national estimates. Each portion of the energy system will be analyzed and associated with a set of 'effects modules', i.e., effects common to different stages of various energy alternatives. Then, because the effects which result depend upon local conditions, appropriate sets of representative regions will be developed (about 20 for the U.S.). Effects estimates will be made for these regions and summed to obtain national estimates. (See also W75-04152) (Houser-ORNL)

COMPARATIVE POPULATION RADIATION DOSE COMMITMENTS OF NUCLEAR AND FOSSIL FUEL ELECTRIC POWER CYCLES,
Office of Radiation Programs, Washington, D.C.
J. E. Martin.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 317-326, 2 fig, 1 tab, 9 ref.

Descriptors: *Nuclear powerplants, *Fossil fuels, *Effluents, *Electric power production, Human population, Public health, Radioactivity effects, Coals, Uranium, Carbon.
Identifiers: Nuclear fuels, *Fuel cycle, *Population exposure.

Past comparisons of the radiological impact of electricity generation by fossil and nuclear fuels have focused on doses to individuals from the power plants and have excluded impacts from the total cycle on the total population. A comprehensive perspective of the radiological impact of a decision to generate electricity by one means or the other is properly based on the total fuel cycle impact and the long-term total effects (environmental dose commitments) on populations. This comparison, using the Biological Effects of Ionizing Radiation (BEIR) Committee data, is made between a typical light-water reactor uranium fuel cycle and a typical coal fuel cycle, which discharges trace amounts of naturally-occurring radioactivity. When compared on this basis the uranium fuel cycle population impacts are found to be predominately from long-lived radionuclides discharged in supporting parts of the cycle; the population impact from the coal cycle is primarily at the power plant. However, the introduction of nonradioactive carbon by coal combustion represents an offsetting factor, per unit of electricity produced, in that it reduces the environmental dose commitment of carbon-14 generated and released by the nuclear fuel cycle. On the basis of radiological impact alone, the long-term population impact of the nuclear fuel cycle appears to exceed that of the coal fuel cycle by a significant margin. In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 333-346, 7 fig, 2 tab, 31 ref.

Descriptors: *Nuclear energy, Facilities, Operations, *Radioactivity, *Kinetics, *Neutron absorption, Radiation, Human population, Public health, Air pollution, Water pollution, Ion transport, Properties, Safety, Evaluation.
Identifiers: *Accelerators, *Personnel exposure, High-energy.

There is increasing interest in estimating the magnitudes of population exposure due to the operation of nuclear facilities. The population exposures that might result from high energy accelerators are described. External whole body radiation is the dominant type of radiation exposure, while exposure resulting from the leakage of radionuclides into the atmosphere or ground water is negligible. At large distances from operating accelerators, neutrons are the predominant form of radiation. The transport of high-energy neutrons through the atmosphere is not well understood at distances greater than about 1000 meters from the radiation

source. Consequently, estimates of population exposure out to distances of 80 km from high energy accelerators may be quite inaccurate. It is extremely important that health physicists and administrators be aware of the limitations of estimates of population exposure. A model is described which facilitates the estimation of population exposure due to accelerators and its limitations are discussed. Suggestions are made for experimental investigations which would improve the model. (See also W75-04152) (Houser-ORNL)

In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 369-374, 18 ref.

Descriptors: Nuclear explosions, *Secondary recovery(Oil), *Natural gas, *Radioactivity, *Tritium, *Krypton, Carbon, *Human population, Environmental effects, Public health, Absorption, Path of pollutants, Food chains.
Identifiers: *Population exposure, Consumer products, Inhalation, Carbon-14.

Methods of assessing radiation doses (hereafter referred to as doses) to individuals and to populations that could result from exposure to compustion products of natural gas produced in wells stimulated by use of nuclear explosives have evolved from work on the Gasbuggy project, the first joint industry-AEC project to use a nuclear explosive to increase natural gas production. Tritium was identified as the radionuclide of principal concern; krypton-85 and carbon-14 are the other long-lived radionuclides present. These dose estimations are theoretical in nature, but efforts are made to make them as realistic as possible by obtaining gas usage data from gas transmission and distribution companies. Studies related to the second nuclear stimulation project, Rulison, have provided improved techniques for calculating population doses from both point and area sources through use of computer codes. The only information from the third nuclear stimulation project, Rio Blanco, that is used is wellhead radionuclide concentrations. Attention has focused primarily on tritium (HTO) inhalation and skin absorption doses which are believed to be the critical exposure pathways. Persons exposed in homes to combustion products from unvented appliances such as kitchen ranges are believed to be the critical exposure population. Some attention has been devoted to other exposure pathways, principally those involving ingestion of consumer products by people. Illustrative results are presented for each technique described. EXPOSURES DURING THE TRANSPORTATION OF RADIOACTIVE MATERIALS,
American Insurance Association, Washington, D.C.
S. M. Fastman.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 21-24, 1974, Knoxville, Tennessee, p 383-388, 1 tab.

Descriptors: *Transportation, Materials, *Radioactivity, Risks, *Insurance, Operations research, Accidents, Hazards, *Safety, Evaluation, Regulation, Standards, *Human population, Public health, Waste disposal, Nuclear powerplants.
Identifiers: Personnel exposure, *Population exposure.

Radiation exposure during the transportation of radioactive materials under normal conditions is discussed. This analysis is based on average conditions as to radiation levels outside of packages, shipping distances, exposure times, distances from shipments and the number of people exposed. The radiation risk that develops from transportation accidents involving nuclear materials also is described. The frequency of transportation accidents in general is evaluated. Projections are made to determine the frequency of accident involving radioactive materials. The limits on radiation levels from individual packages of radioactive materials as well as surface contamination restrictions on such packages are described. External radiation exposure levels for truck drivers, freight handlers, and the general public are given for the transportation of unirradiated fuel, irradiated fuel, and solid radioactive waste under normal conditions. The release of radioactivity during accident conditions is also evaluated. An evaluation is given of the consequences of transportation accidents involving shipments of nuclear fuel or solid radioactive waste. Estimates of the amount of radioactive material released in the unlikely event that a container is breached are provided, taking into account engineering assessments of a variety of package designs, actual accident experience, fuel and radioactive waste properties and experience in shipment, reactor operation and storage. BIOMEDICAL EVALUATION OF LOW FREQUENCY (LONG WAVE) ELECTROMAGNETIC RADIATION ASSOCIATED WITH ELECTRIC POWER TRANSMISSION,
Illinois Univ. Medical Center, Chicago, Ill. School of Public Health.
R. S. Pogrund.
In: CONF. 741018, Proceedings of the Eighth Midyear Topical Symposium of the Health Physics Society, October 2-24, 1974, Knoxville, Tennessee, p 395-404, 1 tab, 22 ref.

Descriptors: *Public health, *Hazards, *Electric power, Fossil fuels, Effluents, Nuclear powerplants, *Radiation, *Radioactivity, Operations, Accidents, Fallout, Air pollution, Water pollution, Gages, Inhalation, Safety, Evaluation, Risks, Radioactivity effects, Radio waves, Genetics, Biology, Biological control.
Identifiers: *Nuclear fuels.

Considerable scientific attention has focused on the possible hazards to human health from such sources of electric power as nuclear and fossil fuels. These hazards have been associated with the release of ionizing radiation during normal reactor operation or accident, as well as human inhalation of gaseous and particulate effluents during the burning of fossil fuels. The safety aspects to human health from these sources for generating electric power have and should be emphasized, but the transmission of the end product itself, electric power, deserves a more serious safety consideration. This becomes especially significant when an industrialized society requires an increasing quantity of electric power whose physical lines of transmission may emit non-ionizing electromagnetic radiation. This radiation may be characterized as extremely low frequency (well below the microwave spectrum or the RF fields generated by television, radar, or radio transmitters). Biomedical or psychophysiological data that show subtle effects upon certain populations that may be at risk due to residential proximity to transmission lines, or to genetic susceptability are reviewed. The central nervous system via electroencephalogram (EEG) is cited particularly for the involved resonant frequencies. (See also W75-04152) (Houser-ORNL)

THERMAL POLLUTION PROBLEMS IN POLAND,
Water Economics Research Inst., Warsaw (Poland). Dept. of Water Chemistry and Biology.
J. Dojlido.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 70-75. 1 tab.

Descriptors: *Thermal pollution, *Powerplants, *Water quality, *Environmental effects, Water temperature, Water cooling, Rivers, Lakes, Ecology.
Identifiers: *Poland.

The heat discharge from power plants in Poland is considered an important source of pollution because of the large influence on surface water quality and biocenosis. In the past only a few

power plants worked with open-cooling systems that utilized surface water. Many power plants now being built and planned will use surface water for cooling and this will create an increase in local thermal discharge and in water temperature downstream. This additional heat will accentuate the existing pollution problem. Data presented showed that only one-quarter of Poland's rivers are really clean. Nearly 30% of the rivers are seriously polluted, exceeding all permissible limits, and cannot be used for any purpose unless treated in very sophisticated and expensive ways. Broad research on the influence of thermal discharge on water quality in Poland is being conducted to eliminate adverse effects and to collect a large amount of data that may be used to predict thermal effects on water quality of slow-flowing, shallow rivers. SOME BIOLOGICAL ASPECTS OF AQUATIC THERMAL DISCHARGES,
Yale Univ., New Haven, Conn. Dept. of Biology.
D. Merriman.
In: Water for the Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 154-164. 40 ref.

Descriptors: *Thermal pollution, Marine biology, *Nuclear powerplants, *Ecosystems, *Heated water, Water temperature, Thermal capacity, Biology, Eutrophication, Water properties, Temperature, Aquatic microorganisms, Environment, Environmental effects, Fish, Productivity, Ecology, Entrainment, Aquatic environment, *Connecticut River.
Identifiers: Connecticut River.

Aquatic ecology and thermal effects, industrial and natural were discussed. The specific case of the operation of the Connecticut Yankee Atomic Power Company plant was discussed as a documented pre- and post-operative study (1965-1972) of the ecosystem. Pertinent problems of entrainment and the passage of anadromous fish were outlined, and the conclusion points to the matters of plant siting and the achievement of rational balance between the desirable ecology and the necessary economy. REJUVENATION OF THE BUFFALO RIVER,
State Univ. Coll., Buffalo. Great Lakes Lab.
R. A. Sweeney.
In: Water For The Human Environment, Volume IV, Special Sessions; Proceedings of the First World Congress on Water Resources (4 Vol.), Chicago, Illinois, September 24-28, 1973. International Water Resources Association, Business Office, 425 Illinois Building, Champaign, Illinois, p 445-455. 1 fig, 4 tab, 15 ref.

Descriptors: *Pollution abatement, *Low-flow augmentation, *Phosphates, *Domestic wastes, *Detergents, Sediments, Cooling water, Stagnant water, Chemical analysis, Sampling, Oxygen, Alkalinity, Conductivity, Nitrogen, Chemical oxygen demand, Biochemical oxygen demand, Phytoplankton, Algae, Oil pollution, *New York, Ammonium salts.
Identifiers: *Benthic macroinvertebrates, *Buffalo River(NY).

The improvements observed in the quality of life in the Buffalo River during the past 7 years have exceeded the most optimistic predictions made prior to the initiation of the Buffalo River Improvement Project and the abatement of pollution by industry. The decrease in quantities of phosphates discharged to the river through the removal of phosphates from detergents sold in Erie County also has had a substantial positive impact on the Buffalo River ecosystem. The phosphate content of detergents was limited to 8.7% phosphorus sold after April 1, 1971 and 0.5% after January 1, 1972. Domestic sewage remains the pollution problem in the river. During the past 3 years, this problem has increased. While funding for the improvement of swage treatment plants was available through state and federal agencies, none was secured by the communities presently discharging to the river. Until a comprehensive sewage treatment plan is implemented in the Buffalo River watershed, the full benefits of the water pollution abatement efforts that have been initiated will not be realized. THE EUTROPHICATION AND POLLUTION OF LAKE PAIJANNE, CENTRAL FINLAND,
Hydrobiological Research Inst., Jyvaskyla (Finland).
K. Granberg.
Ann Bot Fenn, Vol 10, No 4, p 267-308, 1974
Identifiers: Diversity indices, Effluents, *Eutrophication, *Finland(Lake Paijanne), Lakes, Phosphorus, *Phytoplankton, Pollution, Pulp wastes, Species, Water pollution effects.

The eutrophication and pollution of Lake Paijanne in Central Finland was examined with reference to the primary production. The value of the phytoplankton biomasses and some indicator systems for the assessment of trophic and pollutional status was compared with that of the primary production. The effect of pulp mill effluents on primary production and dark assimilation was examined. A rough model of eutrophication was constructed with the aid of species diversity indices. The saprobity system of Caspers and Karbe was applied to Lake Paijanne, and an attempt was made to estimate the bioactivity of the lake. Results showed that primary production was correlated with the correlated with the mean total P concentration of the growing season, except in those areas where production was inhibited by the pulp mill effluents. Phosphorus is still the factor limiting primary production in Lake Paijanne. The mean phytoplankton biomasses of the growing season correlate well with total P concentration, thus being an index of trophic status. According to the results, the bioactivity of a lake expresses the combined effect of eutrophication and pollution. The course of the eutrophication and pollution of Lake Paijanne was traced.--Copyright 1974, Biological Abstracts, Inc.

THE EFFECT OF SALINITY ON A MARINE AND A FRESHWATER ASCOMYCETE,
Wyoming Univ., Laramie. Dept. of Botany.
D. E. Davidson.
Can J Bot, Vol 52, No 3, p 553-563, 1974.
Identifiers: *Ascomycete, Biomass, Cellular, Ecology, *Lulworthia-medusa, Marine, Metabolism, *Ophiobolus-graminis, Respiration, *Salinity, Sea water, Growth rates.

Lulworthia medusa, the marine isolate, grew significantly better in seawater than in freshwater medium. The growth of Ophiobolus graminis, the freshwater isolate, was reduced by 1/2 when grown in seawater. The growth of both species was similar in natural and artificial seawater. Neither species grew under anaerobic conditions. Warburg reaction indicate that the respiration of the freshwater species is reduced in seawater. The percentage reduction is about equal to the reduced growth in seawater, as compared to freshwater. The respirational rates of L. medusa in sea and freshwater were similar. Yet growth in seawater was much greater than in freshwater. Consequently, it is proposed that the respiratory energy produced in a freshwater environment is utilized for cellular functions other than biomass increase. In contrast to the marine isolate, the metabolic processes of O. graminis are severely affected by seawater. Ecological implications of the findings are discussed.--Copyright 1974, Biological Abstracts, Inc.

SAGINAW BAY: AN EVALUATION OF EXISTING AND HISTORICAL CONDITIONS,
Michigan Univ., Ann Arbor. Great Lakes Resource Management Program.
P. L. Freedman.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB 232-440, $5.75 paper copy, $2.25 microfiche. Report No. EPA-905/9-74-003, April 1974. 137 p, 19 fig, 6 tab, 111 ref, 2 append. EPA Contract No. 68-01-1577.

Descriptors: *Water quality, *Baseline studies, *Aquatic microbiology, Water pollution, *Water pollution effects, Impaired water quality, Thermal pollution, Aquatic environment, Sewage effluents, Industrial wastes, Eutrophication, Phytotoxicity, Turbidity, Sedimentation, Great Lakes, *Lake Huron, *Michigan.
Identifiers: *Saginaw Bay(Mich), Saginaw River.

The water quality in Saginaw Bay has deteriorated from its natural Lake Huron character because of man's overburdening use. Both the physical-chemical and biological characteristics indicate deteriorating conditions and trends. Existing information on Saginaw Bay was compiled and evaluated and its present status was documented. Water quality and trophic status were evaluated with regard to physical, chemical, and biological parameters. Efforts were made to identify the community structure of aquatic plant and animal populations. Further emphasis was placed on the identification and nature of water-quality variations and trends and the impact of contaminant sources on the system. (Gibb-ISWS)
W75-04278

BIOLOGICAL PROCESSES INVOLVED IN POLLUTION OF COASTAL AQUACULTURE WATERS,
Central Inland Fisheries Research Inst., Barrackpore (India).
V. Gopalakrishnan.
In: Indo-Pacific Fisheries Council Proceedings, 15th Session, Wellington New Zealand, October 18-27, 1972. Section II: Coastal Aquaculture and Environment, Bangkok, 1974. p 1-7, 18 ref.

Descriptors: *Primary Productivity, *Aquaculture, *Estuaries, *Environmental Effects, *Growth Rate, Pollutants, Coastal, Metabolism, Reproduction, Estuarine Fisheries, Shellfish, Commercial Fish, Biochemical Oxygen Demand, Dissolved Oxygen, Plankton, Toxicity, Industrial Wastes, Domestic Wastes.
Identifiers: Coastal Aquaculture.

An analysis of the basic biological processes involved in the pollution of coastal zone waters is presented and the direct and indirect effects of pollution on primary production, metabolism, growth and reproduction are discussed in the context of coastal aquaculture. (Katz)
W75-04281

TOXICITY OF ZINC AND CYGON, APPLIED SINGLY AND JOINTLY, TO ZEBRAFISH EMBRYOS,
New York Univ., N.Y. Dept. of Biology.
R. R. Roales, and A. Perlmutter.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No. 4, p 475-480, October, 1974. 1 fig, 3 tab, 29 ref.

Descriptors: *Zinc, *Embryonic Growth Stage, *Toxicity, *Organophosphoris pesticides, Mortality, Pesticides, Bioassay, Laboratory tests, Lethal limits, Metals, Water pollution effects.
Identifiers: Brachydanio rerio, *Zebrafish, *Cygon, Pollutant interactions.

The interaction of zinc and Cygon, as well as their individual actions, on zebrafish embryos are examined. The 24, 48 and 72 hour median tolerance limits (Tlm) for both substances were determined and it was indicated that the embyros were more resistant to Cygon. Zinc, at low doses, was found to be antagonistic to the toxic action of Cygon on these embryos. At other levels tested, zinc and Cygon may interact additively. (Katz)
W75-04282

PHYTOPLANKTON ENRICHMENT EXPERIMENTS AND BIOASSAYS IN NATURAL COASTAL SEA WATER AND IN SEWAGE OUTFALL RECEIVING WATERS OFF SOUTHERN CALIFORNIA,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
W. H. Thomas, D. L. R. Seibert, and A. N. Dodson.
Estuarine and Coastal Marine Science, Vol. 2, No. 3, p 191-206, 1975 4 tab, 8 fig, 26 ref.

Descriptors: *Algae, Nutrients, *Nutrient requirements, Water analysis, *Sewage effluents, *Phytoplankton, Nitrogen, Growth rates, *Bioassay, Primary productivity, *California, On-site data collections, Laboratory tests, Surface waters, *Eutrophication, Sewage Treatment, *Fluorescence.
Identifiers: Receiving waters.

Nutrient enrichment experiments with near-shore Southern California surface water showed that nitrogen was the principal nutrient limiting phytoplankton growth. Bioassays of receiving waters taken above major sewage outfalls were carried out using representative Southern California phytoplankton cultures. The bioassays showed that the receiving waters were sometimes stimulatory, and at other times inhibitory, to algal growth. These studies were done using in vivo fluorescence to measure the growth of the algae. In cultures, cell division rates and increases in in vivo fluorescence were comparable and this indicates that fluorescence is a reasonable way of following growth. (Katz)
W75-04283

THE EFFECT OF CADMIUM ON POPULATION GROWTH IN THE GREEN ALGA SCENEDESMUS QUADRACAUDA,
State Univ. of New York, Buffalo. Dept. of Biochemistry.
E. Klass, D. W. Rowe, and E. J. Massaro.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 4, p 442-445, October 1974. 1 tab, 1 fig, 17 ref.

Descriptors: *Algae, *Cadmium, *Toxicity, *Industrial wastes, Scenedesmus, Heavy metals, Primary productivity, Laboratory Tests, Environmental effects, Water quality, Water quality control, Water pollution effects.
Identifiers: *Scenedesmus quadracauda.

As a result of industrial utilization, cadmium is present in increasing levels in the environment. This study examines the toxicity of cadmium to the freshwater alga Scenedesmus quadracauda. Results of experimentation indicate that there is no significant effect of cadmium on mean population size in concentrations below 6.10 ppb. Significant differences were observed between control media and progressive increases of Cd2+ concentrations. At 6.10 ppb, an inhibitory effect is observed. Severe growth inhibition is observed at 61 ppb; this may be due to enzyme inhibition. (Katz)
W75-04284

EFFECTS OF PHTHALATE ESTERS ON SHRIMP,
Sapporo Medical Coll. (Japan). Dept. of Public Health.
N. Sugawara.
Bulletin of Environmental Contamination and Toxicology, Vol 12 No 4 p 421-424, October, 1974. 1 fig, 1 tab, 6 ref.

Descriptors: Pollutants, *Industrial wastes, *Toxicity, *Lethal limit, Water pollution effects, Invertebrates, Immature growth stage, Mortality, Hatching, Brine shrimp, Environmental effects, *Shrimp.
Identifiers: *Phthalate esters, DEP, DMP, DBP.

Phthalate esters have become increasingly significant as pollutants with the increasing production of plastics. To estimate the toxicity of phthalate esters to freshwater invertebrates, the effect of phthalate esters on hatching of shrimp eggs and the mortality of the nauplius or larvae stage was tested. Toxic order of three tested substances was DBP much greater than DEP greater than DMP. (Katz)
W75-04285

UPTAKE OF CHLORINATED PARAFFINS AND PCB FROM SUSPENDED SOLIDS AND FOOD BY JUVENILE ATLANTIC SALMON,
Fisheries Research Board of Canada, St. Andrews (New Brunswick). Biological Station.
V. Zitko.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 4, p 406-412, October, 1974. 4 tab, 10 ref.

Descriptors: Polychlorinated biphenyls, *Bioassay, *Atlantic Salmon, *Toxicity aroclor, Laboratory tests, Suspended solids, Pesticides, Mortality, *Absorption, Water pollution effects.
Identifiers: *Bioaccumulation, *Chlorinated paraffins.

Chlorinated paraffins have been suggested as PCB substitutes in many applications. The uptake of chlorinated paraffins with 40% and 70% chlorine, and of PCB with 54% chlorine, by juvenile Atlantic Salmon was described. The preparations were administered in food and absorbed on silica. Results showed that chlorinated paraffins were significantly less accumulated by juvenile Atlantic Salmon than was PCB. Chlorinated paraffins at 10 and 100 micro g/g in food were very likely toxic to juvenile Atlantic Salmon, but additional experiments are required to confirm the conclusion. (Katz)
W75-04286

ACUTE TOXICITY OF A ZINC-POLLUTED STREAM TO FOUR SPECIES OF SALMONIDS,
Colorado Div. of Wildlife, Fort Collins. Fisheries Research Center.
R. B. Nehring, and J. P. Goette, Jr.
Bulletin of Environmental Contamination and Toxicology, Vol 12, No 4, p 464-469, October, 1974. 5 tab, 4 ref.

Descriptors: *Salmonids, *Zinc, *Toxicity, *Bioassay, *Trout, Water pollution effects, Laboratory tests, Rainbow trout, Brown trout, Brook trout, Cutthroat trout, Lethal limit, Streams, Heavy metals, Mine wastes, Water pollution sources, Methodology, Water quality.

Research was done to compare laboratory zinc bioassay results with the toxic effects of a zinc-polluted stream on rainbow trout, and to compare the relative sensitivities of rainbow, brown, cutthroat and brook trout species to zinc. Fish were exposed to different dilutions of water from a stream polluted by zinc for 14 days. The TL50 for rainbow trout was 0.41 mg zinc/liter. TL50 values determined for zinc on brown trout, cutthroat trout and brook trout were 0.64, 0.67, and 0.96 mg/1, respectively. (Katz)
W75-04287

EFFECT OF TURBIDITY ON ALGAL GROWTH,
Illinois State Water Survey, Urbana.
W-C, Wang.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-239 399, $3.25 in paper copy, $2.25 in microfiche. Circular 121, 1974. 12 p, 8 fig, 5 tab, 22 ref.

Descriptors: *Eutrophication, *Algae, *On-site investigations, *Laboratory tests, *Illinois, Rivers, Sampling, Surveys, Analytical techniques, Evaluation, *Turbidity, Nutrients, Testing procedures, Water analysis, Incubation, Algal control.
Identifiers: *Illinois River(Ill), *Fox River(Ill), Algal growth.

A comparative study was made to determine the effect of water turbidity on algal growth. The growth of algae in Illinois River water which is characterized by turbid conditions and generally void of algal blooms was compared with algal growth in Fox River water which is generally clear except during periods of frequent algal blooms. Biweekly water samples were taken from the Illinois River at Peoria and the Fox River at Oswego and at Dayton. Half of each sample was filtered through 0.45 micrometer membrane filter to remove all particulate matter. The filtered portion and the remaining unfiltered sample were separately inoculated, and the algal growth potential of each fraction was determined under various incubation conditions. The experimental results suggest that high turbidity conditions retard algal growth, a light-inhibition effect. In some cases, however, particulate matter appeared to stimulate algal growth. (Humphreys-ISWS)
W75-04306

EXPERIMENTAL DATA FOR HYGIENIC STANDARDIZATION OF DIHYDROPEROXIDE META-DIISOPROPYLBENZE IN SURFACE WATERS, (IN RUSSIAN),
Sanitarno-Gigienicheskii Meditsinskii Institut, Leningrad (USSR).
A. G. Ilichkina.
Gig Sanit. Vol 38, No 3, p 108-110. 1973.
Identifiers: Bacterial studies, *Benzene compounds, Chick, Embryos, *Hygienic standards, Microorganisms, Pollution, Rabbit, Rat, Surface waters, *Chemical analysis, Organic compounds, Water quality standards, *Lethal limit, *Toxicity, *Bactericides, Water pollution effects.

Quantitative chemical analysis of dihydroperoxide meta-diisopropylbenzene (DHP-M) was done in surface waters. Stability, stimulating effect on growth of saprophytic microflora, bacteriostatic and bactericidal effects were evaluated. DHP-M had an adverse effect on the process of mineralization of N-containing organic substances. Toxicological studies were done in white rats, rabbits and chick embryos. Concentrations of DHP-M should not exceed 1 mg/l. Toxicological data was the limiting factor.--Copyright 1974, Biological Abstracts, Inc.

5D. Waste Treatment Processes

IMPROVED PROCESS FOR TREATING WATER AND WASTEWATER,
P. Lin.
US Patent No 3,855,125, 7 p, 8 fig, 4 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 1204, December 17, 1974.

Descriptors: *Patents, *Neutralization, *Industrial wastes, *Waste water treatment, Pollution abatement, Water pollution control, Phosphates, Acids, Turbidity, Lime, Calcium carbonate, Calcium sulfate.
Identifiers: Thermal fracture.

A process is disclosed for neutralizing acids in industrial wastes and to remove contaminants such as phosphates, acids and turbidity in wastewater. The steps consist of mixing with the wastewater a material consisting of a core of lime having a shell of distinctly cracked calcium salt derived by heating such material to a temperature above 600 deg C for a period of two to forty minutes and suddenly quenching such material by cooling to room temperature to induce thermal fracture. The distinctly cracked calcium shell then has access channels to the core. The shell is selected from the group consisting of calcium sulphate and calcium carbonate. The next step consists of collecting and separating sludge formed as a byproduct of reaction between the lime core and the contaminants to obtain clean water. (Sinha-OEIS)
W75-03857

OXYGENATION OF WASTE WATER,
P. W. Garbo.
US Patent No 3,855,120, 5 p, 2 fig, 8 ref; Official Gazette of the United States Office, Vol 929, No 3, p 1202, December 17, 1974.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Oxygenation, *Biochemical oxygen demand, Pollution abatement, Water pollution control, Water quality control, Sands.
Identifiers: Slag, Alumina, Feldspar, Granite, Hematite, Coke, Glass.

Sewage or other waste water is passed together with oxygen-containing gas upward through a turbulent mass of solid contact particles. The randomly moving contact particles such as coarse and collide with the pollution solids and effect a fine dispersion of the oxygenating gas throughout the liquid suspension. The pollution solids are thus subjected to attrition by the turbulent mass of contact particles. The fine dispersion of oxygenating gas makes intimate contact with the suspended solids and dissolved solids of the sewage or waste water with the result that its oxygenation is accelerated. The water upflow is regulated not to exceed 500 gallons per minute per square foot of horizontal cross-section of the expanded and turbulent mass of solid contact particles. The oxygenating gas supplied to the process has an oxygen content of at least about 60% by volume, and the BOD-containing water and the oxygenating gas are maintained at elevated pressure higher than hydrostatic pressure while flowing up through the expanded and turbulent mass of solid contact particles. Water rising above the top of the expanded and turbulent mass of solid contact particles is recycled to the bottom of the mass for flow up through the mass at a rate not exceeding 20 volumes of the recycled water per volume of BOD-containing water being supplied to the process. The solid contact particles are selected from the group of materials consisting of sand, alumina, feldspar, granite, hematite, slage, coke and glass. (Sinha-OEIS)
W75-03858

PROCESS AND DEVICE FOR PURIFICATION OF EFFLUENTS CONTAINING PHENOLS AND AMMONIUM SALTS,
Societe pour l'Equipment des Industries Chimiques, Paris (France). (assignee)
P. Marecaux.
US Patent No 3,855,076, 4 p, 2 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 1189, December 17, 1974.

Descriptors: *Patents, Water purification, *Phenols, *Ammonium salts, *Waste water treatment, Pollution abatement, Water pollution control, Evaporation, Effluents, Equipment.
Identifiers: *Caustic alkali, Multi-stage evaporators, Coking plants, Sodium hydroxide.

The purification of effluents containing phenols and ammonium salts especially those derived from coking plants is described. The process comprises adding sufficient caustic alkali to the effluent to convert the ammonium salts with strong acids into ammonia; partially evaporating the resulting liquid mixture to remove as vapor, ammonia and other volatile constituents; incinerating the vapor thus produced; evaporating the remaining liquid to produce vapor and a concentrate; scrubbing the vapor so obtained with a solution of caustic alkali; incinerating the concentrate; and discharging the scrubbed vapor and the products of the incineration. Since all the volatile components and especially ammonia are removed by the preliminary treatment, the liquid which is concentrated by evaporation contains only phenols as volatile products, which, when vaporized, are held back by the scrubbing with caustic alkali solution. Thus the condensate from the evaporation is only practically pure water and only the final concentrate containing the greater part of the impurities needs to be incinerated. The invention includes a device comprising an incineration furnace; a steam boiler; a column for partial evaporation to receive effluent after it has been rendered alkaline; a duct to convey the vapors from the column to the incineration furnace; a multi-stage device for evaporating the liquid, which has means for scrubbing the vapors produced by bubbling them through a solution of caustic alkali; and a duct for conveying concentrate from the multi-stage evaporation device to the incineration furnace. (Sinha-OEIS)

PLANT FOR TREATING WATER, IN PARTICULAR SEWAGE OR SLUDGE,
Sulzer Bros. Ltd., Winterhur (Switzerland). (assignee)
E. Bosshardt.
US Patent No 3,854,875, 3 p, 3 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 1135, December 17, 1974.

Descriptors: *Patents, *Sewage treatment, *Irradation, *Waste water treatment, Pollution abatement, Water pollution control, Sludge, Equipment, Microorganisms.
Identifiers: *Gamma radiation, Germs.

The water treatment plant is operated on a batch basis with sludge repeatedly circulated past a source of gamma radiation in order to destroy harmful germs in the sludge batch. After a number of circulations, the batch of sludge is flushed into a collecting vessel for subsequent removal. The sludge batch is passed by the radiation source through a large flow cross-section and at a high flow velocity. The plant achieves a uniform radiation of each batch. (Sinha-OEIS)
W75-03862

SELF-CLEANING FILTER FOR HYDROLOGICAL REGENERATION,
E. S. Perkins.
US Patent No 3,854,291, 3 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 929, No 3, p 945, December 17, 1974.

Descriptors: *Patents, Dams, *Water pollution treatment, *Filtration, Pollution abatement, Rivers, *Sewers, *Conduits, Rainfall, *Waste water treatment.

An improved dam system is described wherein polluted water is filtered and the filter is periodically cleaned by automatic backwash due to varying levels of the stream. A plurality of holding dams are mounted in a stream. Each holding dam is formed with a filter portion which receives the principal polluted liquids carried by water tight sewage conduits, which are placed under the stream bed and extend between dams. The sewer conduit supplies its output to a gravity feed filter formed in the dam between its upstream and downstream edges such that the polluted liquid pass through the filter and into conduits which deliver it into the holding pool above the upstream side of the dam. Discharge conduits extend from the holding pool on the upstream side of the dam to the dam and discharge the filtered and purified water to the downstream flow. During periods of unusually high rainfalls the water in the holding pool rises and reaches a level which will cause the discharge conduits through the dam to close and the water will continue to rise and flow over the top of the dam. As the water recedes the head in the holding pool becomes greater than that in the filter and the water passes through the filter in reverse direction, thus backwashing and cleaning the filter. An output from the filter portion of the dam is provided which connects with the underground sewer conduit for the next section of the stream. (Sinha-OEIS)
W75-03864

APPARATUS FOR SEPARATING SOLIDS FROM LIQUIDS,
Ecodyne Corp., Chicago, Ill. (assignee)
W. A. Wachsmuth, and L. Anders.
US Patent No 3,852,199, 4 p, 17 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 929, No 1, p 285, December 3, 1974.

Descriptors: *Patents, *Waste water treatment, Equipment, *Separation techniques, Solid wastes, Pollution abatement, Water pollution control.
Identifiers: *Solid-liquid separation.

A multi-tube settling device is used for separating solids from liquids. It is made from identical, extruded, planar plastic parts. Each part has a series of spaced-apart straight, parallel grooves or slots on one surface. Slots are defined by material integral with planar parts which project perpendicular to the opposite surface. Ribs are dimensioned to be received in the slots. Each rib has an enlarged terminal to fit snugly into the slot. The end ribs are offset slightly toward the center and the end projections are shortened so that the exterior of the device does not have projections which would unnecessarily take up space. Waste is substantially eliminated, and the inner surface of the tubes along which solid particles settle are substantially unobstructed so as to provide minimum interference with the downward flow of the solid particles. METHOD AND APPARATUS FOR USE IN WATER PURIFICATION BY REVERSE OSMOSIS,
Ultrascience, Inc., Skokie IH. (assignee).
E. L. Gibbs.
U.S. Patent No 3,846,295, 4 p, 2 fig, 16 ref; Official Gazette of the United States Patent Office, Vol 928, No 1, p 262, November 5, 1974.

Descriptors: *Patents, *Water purification, *Reverse osmosis, Water quality control, Pollutants, Water pollution control, Pollution abatement, Equipment, Membranes, *Waste water treatment, Water supply.

A method of an apparatus for water purification from raw water by reverse osmosis is described. A reverse osmotic flow is created through a membrane with the concentrate water forming at the input side of the membrane being withdrawn in a pulsed flow. By pulsing the concentrate water flow, the flow is divided into periods of maximum flow and intermediate periods with at least a lesser flow, and may be reduced to no flow. The operating parameters are so determined that the periods of maximum flow involve a sufficient flow to provide adequate flow turbulence over the membrane surface with sufficient flushing to prevent excessive boundary layer formation at the membrane and to maintain particulate material suitably in suspension in the concentrate water. Intermediate periods of lesser or no concentrate flow are so dimensioned as to duration that any boundary layer formation or particulate disassociation resulting during such period is materially countered by the established flow and period duration of the maximum flow period. A very efficient unit for small operations may be produced, utilizing commercially available membrane units, in conjunction with suitable valves in the concentrate water discharge line adapted to be operated by suitable timing devices to provide desirable durations of maximum and intermediate flow periods. LIQUID AERATING APPARATUS,
Solem Machine Co., Rockford, Ill. (assignee).
J. R. Earhart, J. D. Crocker, and J. K. Johnson.
U. S. Paten No 3,836,130, 5 p, 6 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 926, No 3, p 912, September 17, 1974.

Descriptors: *Patents, *Waste water treatment, Pollution abatement, *Aerators, Water pollution control, Water quality control, Equipment, Aeration.

The aerator contains a throat which extends upward. It has an impeller to pump liquid upward through the throat. A diffuser directs the liquid outward in an annular spray patten. The motor is mounted above the diffuser for driving the impeller. An electrical heater extends around the outer periphery of the diffuser. It inhibits the formation of ice when the aerator is operated in freezing temperatures. The heater is in the form of a ring that overlies the upper side of the diffuser outward of the motor. WASTE WATER TREATMENT SYSTEM,
E. T. Armstrong.
U. S. Patent No 3,853,764, 15 p, 14 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 929, No 2, p 774, December 10, 1974.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Pollution abatement, Water pollution control, Anaerobic bacteria, Disinfection, Aeration, Oxygenation, Activated sludge, Trickling filters, Microorganisms, Equipment, Treatment.
Identifiers: *Liquid-gas exchange, Gas disinfectants, Settling tanks.

A new concept is presented in liquid processing particularly in sewage treatment utilizing air, oxygen or a carrier fluid with some liquid or gas disinfectant as an attenuator or anaerobic biota, for generalized disinfection, for aeration, or for oxygenation. Unique designs and/or processes are incorporated into the conventional settling tanks associated with sewage treatment, as well as in the bioprocesses, activated sludge or trickling filter operations. The structural improvements in settling reduce velocity, inhibit boundary layer separation and act to suppress mixing of the sewage to greatly enhance solid and fluid separation; the key is to improve efficiency of the liquid-gas exchange whereby much better oxygen contact is achieved. The liquid-gas exchange feature utilizes a high momentum exchange under turbulent flow conditions in a hydraulic pressure gradient to achieve intimate mixing of the desired gas in the fluid so as to achieve the desired liquid-gas exchange. GUIDE TO WATER CLEANUP MATERIALS AND METHODS,
Arthur D. Little, Inc./Learning Systems (Cambridge, Massachusetts), 1974. 335 p.

Descriptors: Pollution abatement, *Treatment facilities, Equipment, *Waste water treatment, *Water pollution control, Planning, *Regulation, Legislation, *Legal aspects, *Instrumentation, Monitoring, Environmental control, Oil spills, Pumps, Chemicals, Additives, Publications, Management, Contracts, Barriers, Engineering structures, Water treatment, Flowmeters, Governments, Water law.

Various waste water treatment and pollution control equipment, such as booms, barriers, skimmers, separators, flowmeters, pumps, oil monitors, and analytical instruments, as well as sorbents and other chemical additives are described. Information is also provided on contingency planning, cleanup contractors, cooperatives, federal and state regulations, and environmental protection agencies. A glossary of terms, useful tables and conversion factors, and an index are appended. (Brown-IPC)

THE ATTEMPTS TO MODIFY THE ACTIVATED SLUDGE PROCESS IN SULPHATE PULP WASTE WATER (IN JAPANESE),
Government Industrial Research Inst., Takamatsu (Japan).
H. Kamishima, and I. Akamatsu.
Japan Tappi, Vol 27, No 9, p 449-456, Sept., 1973. 8 fig, 8 tab, 9 ref. English summary.

Descriptors: *Waste water treatment, *Bleaching wastes, *Pulp wastes, *Color, *Lignins, *Activated sludge, *Ozone, *Activated carbon, Chemical oxygen demand, Organic loading, Biochemical oxygen demand, Laboratory tests, Effluents, Industrial wastes, Pulp and paper industry, Foreign research.
Identifiers: Japan, Kraft mills, Alkaline extraction, Black liquors.

Two approaches to improved decoloring of alkaline extraction effluents from kraft mill bleach plants are reported. In one attempt, activated sludge was acclimatized to dilute black liquor at very low BOD loadings for 1 year. This did not improve the removal of lignin and of COD, while color removal amounted to ca. 20%. In the second study, the effluent was ozonized, which resulted in greatly improved removals of TOC, COD, lignin, and color bodies. Subsequent activated sludge treatment gave adequate removals of BOD components resulting from the ozone treatment. Activated carbon adsorbed very little lignin from ozonized effluents. (Brown-IPC)

STUDIES OF RENOVATION OF PULP MILL WASTE WATER; THE CONDITIONS OF THE PERCOLATION THROUGH ACTIVATED CARBON COLUMN FOR KRAFT PULP LIGNIN (IN JAPANESE),
Government Industrial Research Inst., Takamatsu (Japan).
H. Kabeya, T. Fujii, and Y. Kimura.
Japan Tappi, Vol 27, No 8, p 378-383, Aug, 1973. 3 fig, 5 tab, 9 ref. English summary.

Descriptors: *Waste water treatment, *Pulp wastes, *Adsorption, *Filtration, *Percolation, *Lignins, *Activated carbon, Solids contact processes, Water pollution treatment, Pollution abatement, Color, Waste water(pollution), Industrial wastes, Pulp and paper industry, Laboratory tests, Foreign research, Chemical oxygen demand, Organic loading, Deaeration.
Identifiers: Chemical consumption, Japan, Kraft mills.

The efficiency of lignin removal from kraft mill effluents by passage through fixed-bed activated carbon columns was investigated in laboratory trials. Compared at the break-through point, the weight of carbon needed for downflow operation was 15-30% higher than for upflow treatment. Among deaeration pretreatments for the porous columns, boiling water consumed only 72-75% of the carbon needed after nonboiling water flushing. A theoretical hyperbolic relationship between carbon consumption and contact time was developed and verified experimentally. Effluents collected from the columns at regular intervals were analyzed and found to contain COD/lignin and TOC/lignin ratios of 1.12:1 and 0.73:1, respectively. (Brown-IPC)

ON THE APPLICATION OF POLYELECTROLYTES TO WHITE WATER TREATING BY DISSOLVED-AIR FLOTATION (IN JAPANESE),
Kurita Water Industries Ltd., Osaka (Japan).
Y. Furukawa.
Japan Tappi, Vol 27, No 8, p 384-393, Aug 1973. 11 fig, 5 tab, 18 ref. English summary.

Descriptors: *Flotation, *Waste water treatment, *Pulp wastes, Water pollution sources, Pollution abatement, Water pollution treatment,

*Fibers(Plant), *Suspended solids, Chemicals, Polyelectrolytes, Polymers, Softwood, Hardwood.
Identifiers: *White waters(Paper machine effluents), Flotation aids, Fillers(Pigments), Aluminum sulfate, Polyacrylamide, Polyethylenimine.

Factors affecting the removal of suspended solids, such as pulp fines, fillers, and alum particles, from paper machine white waters were investigated in laboratory tests, using different flotation aids. The floatability of pulp fibers varied with the kind of pulp. Softwood fibers floated less readily than did hardwood fibers. Flotation rates increased when up to 50% filler (based on pulp weight) was present, but was impeded by the presence of alum (aluminum sulfate). For a given hardwood pulp, the efficiency of polyethylenimine and polyacrylamide varied with the manufacturing origin of these preparations. In the presence of filler particles, polyacrylamide was generally more effective. When alum was present, polyethylenimine was superior at alum concentrations of up to 11ppm, but inferior to the polyamide at higher alum levels. The floatability of pulp in the presence of both alum plus filler was poor. The greatest volume of clarified water was obtained with ca. 11 ppm of alum, for which polyacrylamide was a better aid than was polyethylenimine. It is concluded that aluminum sulfate significantly affects the flotation of white water solids, and that the choice of flotation aids depends on the local composition of waste waters to be treated. (Brown-IPC)

USE AND DISPOSAL OF SOLID WASTES FROM PULP AND PAPER PRODUCTION (VYUZITIE A LIKVIDACIA PEVNYCH ODPADOV Z VYROBY BUNICINY A PAPIERA),
Vyskumny Ustav Papier a Celulozy, Bratislava (Czechoslovakia).
R. Borisek, and J. Jaros.
Papir a Celuloza, Vol 29, No 9, p 213-214, 1974. 2 tab, 11 ref.

Descriptors: *Solid wastes, *Pulp wastes, *Waste disposal, *Wood wastes, *Sludge, Lime, Mud, Bark, Sawdust, Wastes, Disposal, Ultimate disposal, Construction materials, Fuels, Soil amendments, Fly ash, Europe, Pulp and paper industry, Yeasts, Carbohydrates, Byproducts, Organic compounds, *Waste treatment.
Identifiers: *Czechoslovakia, Furfural, Xylose, Building boards, Wood particle boards.

Tabulated data are given showing that the pulp and paper industry in Czechoslovakia generates solid waste amounting to 28% of the total pulp produced (calculated by weight). The wastes include sludges from primary and secondary treatment of effluents, lime mud, bark, sawdust, ash, and others. Chemical processing of these solid wastes can yield furfural, xylose, fodder yeast, and fodder extenders. Mechanically processed wastes can be made into particle and construction boards or soil conditioners. Generally, all organic wastes with low moisture content can be burned to generate energy. (Trubacek-IPC)

AN EXAMPLE OF TREATMENT OF EFFLUENTS FROM PAPERMAKING WITH A VIEW TOWARD RECYCLING (UN EXEMPLE DE TRAITEMENT DES EFFLUENTS DE PAPETERIE EN VUE DU RECYCLAGE),
B. Follea.
ATIP (Association Technique de l'Industrie Papetiere) Revue, Vol 28, No 5, p 247-252, 1974. 2 fig, 7 ref.

Descriptors: *Pulp and paper industry, *Recirculated water, *Waste water treatment, *Treatment facilities, *Water reuse, Sewage treatment, Recycling, Water purification, Flocculation, Waste treatment, Chemical precipitation, Wastes, Industrial wastes, Reclaimed water, Waste water(Pollution), Pulp wastes, Water conservation.

The waste water treatment system developed for a 320 ton/day paper mill with two paper machines and one coater is described. The system centers around a flocculator/clarifier and was specifically designed for recycling of clarified water to the mill process water. Tests carried out in developing the system are outlined.
